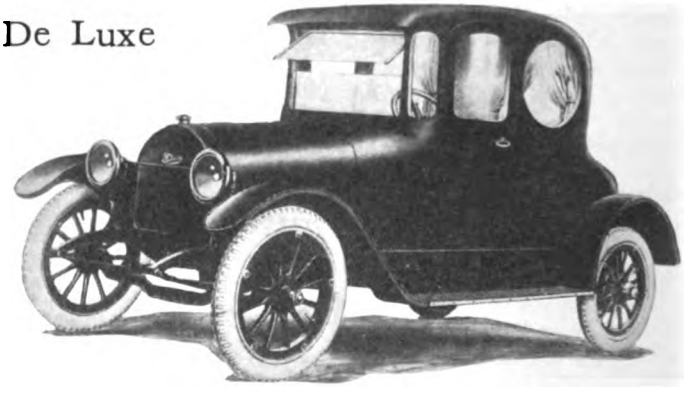
THE Pullman Motor Car Co., of York, Pa., in bringing out its De Luxe coupé has given special attention to the requirements of women automobilists by equipping the car with the C-H magnetic gearshift and by combining city design with all the power necessary for touring. The general effect is of easy flowing lines, even to the rounded corners of the windows. Seats are extra wide with deep cushions and upholstering of broadcloth. The general interior finish is similar to that of an electric, although less attention has been given to the niceties of boudoir equipment such as mirrors, receptacles for toilet articles, etc., than to improving the mechanical features of the car to render it suitable for women's use. The car sells for $990.



Pullman De Luxe coupé which lists at $990

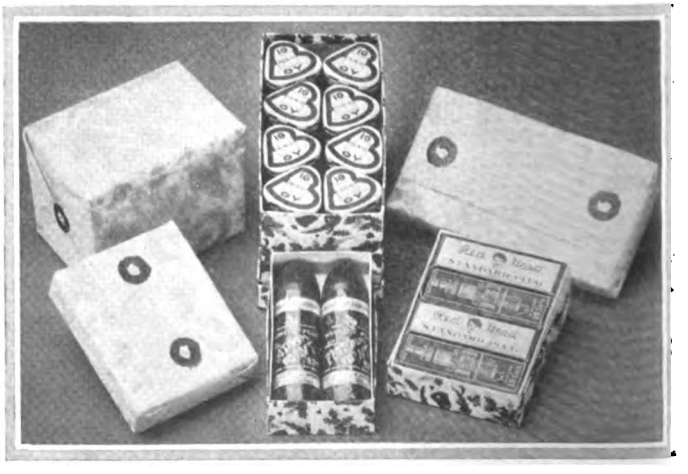
Grossman Xmas Gift Packages

IN keeping with the Christmas spirit the Emil Grossman Mfg. Co., Brooklyn, N. Y., is putting out several gift packages of spark plugs appropriately packed for presentation. These packages may contain an assortment of spark plugs suitable for any particular car and also for motorcycles. Following is a partial list and retail prices of the Red Head gift packages:

8 Big Boy Plugs, ⅞ in.—18 only	$8.00
6 Big Boy Plugs, ⅞ in.—18 only	6.00
4 Standard Plugs, all threads	3.00
6 Standard Plugs, all threads	4.50
4 Priming Plugs, for Ford, all threads	5.00
(One Priming Can Free with each set of four Priming Plugs.)	
2 Platinum Metric Motorcycle Porcelain Plugs	3.00
4 Long Body, for Ford, Overland, Reo, Maxwell and Studebaker	3.00
4 ⅞ in.—18—½ in. extension for Buick and Chalmers	3.00
6 ⅞ in.—18—½ in. extension for Buick and Chalmers	6.50



Christmas gift packages of spark plugs prepared by Emil Grossman Mfg. Co., Brooklyn, N. Y.

Body Capacity

MORE than ever before the advertising departments of our manufacturers have exploited the roominess of tonneaus. Sales departments have in more than one case forced the engineer to enlarge the body till its dimensions are the limit the chassis can carry, so that the seven-passenger car has a really very large floor area. Why this demand for more seven-passenger machines? Why the cry for more and more room in bodies of every capacity? A little experience in the use of a number of the new cars shows that many of them are altogether uncomfortably big except when filled to capacity, and even then there is often waste space not occupied. In the heat of summer this is all very well, but for more than six months of the period during which automobiles are most in use draughts are rather to be avoided than to be desired, and an open touring car becomes draughty in proportion to its floor area.

There are thousands of people who only desire a four-seated car, thousands who have not the least desire to carry more passengers than this number, and for such the close-coupled style of body is infinitely preferable. Driver and tonneau passengers get close enough to enable conversation to be carried on, there are few draughts, there is greater comfort, because all passengers come well within the wheelbase and some weight is saved. Thus we wish to enter plea for a type of body which seems to have a great field; to ask manufacturers not to neglect the demand for a body that comes between the big seven-seater and the clover leaf. The demand exists for all classes of automobiles from $500 to $5,000.

Electrical Development

ELECTRICAL automobile equipment is a great deal better on the 1916 cars than it was with the 1915 models; the generators and motors are better, the batteries are better, the wiring and petty details also better. Perfection is still a long way off, however, and electrical equipment cannot be regarded as having yet attained more than a distant approach to the ultimate form because of the infinite variety observable at the present time. Among the numerous machines and types there may be two or three which will be permanent, but it would be foolish to try prediction as to which is the most probable future type.

But, we may chronicle a distinct stage in development; we have reached a point where the engineering quality of the machines is of a high order, and development will be along manufacturing lines rather than those of scientific experiment.

The automobile manufacturer can choose among a great variety of systems with confidence that any will give satisfaction to his customers, so the industry is being freed to give consideration to matters of detail rather than of principle. It will be some years yet before the electric apparatus on the average automobile will be as self-preserving as the magneto, though some parts of it have already attained almost the same degree of reliability. A comparison of reviews of the electrical accessories to-day, last year and the year before is very interesting, as it shows the tendency toward simplification all along the line, and the record of progress in this field is quite as remarkable as any other record in connection with history of the most remarkable trade in the world.

Marking Time

WITH the end of November there are left but a few new models of passenger cars to be announced this year. At the Show there will not be many surprises, the wonderful engineering development which began about September, 1914, has produced a huge crop of new designs, of which announcement has been made month by month since the last New York Show. At the shows just coming we shall see the results of a progress that was exhibited in an early stage only, at the shows of last January. Undoubtedly we would not anticipate many new cars to appear in the early months of 1916.

The designs of 1916 are on trial in the hands of the public; they are largely different from the designs of any previous year and engineers will wait for the public's verdict, and this will hardly be forthcoming till the summer. Thus it seems reasonable to expect 1916 to be a year of consolidation rather than of creation in the engineering field. It would not be reasonable to expect the immense pace of last year's progress to be maintained.

G. E. Buys Interest in Owen Co.

Entz Motor Patents Corp. Is Formed to Control Entz Electric Patents

NEW YORK CITY, Nov. 30—The General Electric Co., Schenectady, N. Y., has secured a substantial interest in the R. M. Owen Co., manufacturer of the Owen magnetic car and controller of the patents of J. B. Entz on electric transmission systems as employed in this car. Co-incident with the appearance of the General Electric Co., in this movement is the organization of the Entz Motor Patents Corp., which will control all of the Entz electric patents and also has a license to use all of the General Electric patents that will be helpful in the Entz electric system. This new corporation is capitalized at $6,000,000, made up of $5,000,000 common and $1,000,000 7 per cent preferred. The stock is not placed on the market.

The General Electric Co., has already begun tooling up its Fort Wayne, Ind., factory for the manufacture of the electric unit for the Owen company, and all other concerns that will be licensed by the Entz Motor Patents Corp., to use the Entz transmission system. The Fort Wayne plant is one of the best ones of the General Electric and is centrally located for the automobile industry, being close to Detroit, Cleveland, Toledo, and all of the large automobile centers in that section.

To Increase Production

Under this new arrangement the R. M. Owen company will continue the manufacture of the Owen magnetic car at its factory where 100 of the cars have already been completed and production has started on a second run of 500. Production will rapidly increase.

R. M. Owen will be president of the Entz Motor Patents Corp., and E. S. Partridge will be sales manager.

It has been known for several months that the General Electric Co., has been deeply interested in the Owen magnetic. Last July the General Electric made a very exhaustive test of two Owen magnetic cars which were driven from New York to their laboratories where tests on the efficiency of the electric transmission system were conducted, these extending over two days. These tests were entirely satisfactory, and after the tests were completed, the Owen cars were given road test under the direction of W. P. Potter, chief engineer of the railroad department, and C. E. Stone, manager of the lighting department, in company with Henry Chatain, who has charge of the gasoline-electric department of the company. In the road test the cars were driven from Schenectady to the General Electric factory at Erie, Pa., and thence to Pittsfield, Mass., thence to Lynn, Mass., and finally back to New York. In the meantime a hill-climbing competition was carried out on Kennedy's Mountain, near Cornwall. This mountain has a grade of 17 per cent for 2000 ft. and 11 per cent for 3000. Here ten of the engineering corps of the General Electric put the Owen cars through their final test. It was as a result of this road performance that the General Electric decided to secure a substantial interest in the Entz patents.

The Carl H. Page Motors Co., 350 North Broad Street, Philadelphia, has taken the agency for the Owen magnetic, and will have a formal opening Dec. 13. R. D. Willard is in charge.

—

Elcar Price Raised to $795

ELKHART, IND., Nov. 26—The Elkhart Carriage & Motor Car Co., this city, maker of the Elcar, has raised the price of its 1916 cars from $775 to $795, owing to several changes in construction.

—

Cassidy Leaves Johns-Manville to Head New Selling Co.

NEW YORK CITY, Nov. 27—E. A. Cassidy on Jan. 1 will sever his connection with the H. W. Johns-Manville Co., this city, as general manager of the automobile accessory department to become president of the Edward A. Cassidy Co. The new company will be a selling organization and will market the entire products of several automobile accessory and parts makers. The company will sell solely to jobbers and automobile makers, and will have its headquarters in New York with branch offices in Chicago, Detroit, Boston and San Francisco.

—

Plummer Leaves Locomobile

NEW YORK CITY, Nov. 30—John F. Plummer, manager of the Locomobile branch in this city has resigned to take effect Dec. 1. Mr. Plummer is one of the oldest dealers on the Broadway Row, and has been with the Locomobile company practically sixteen years, starting with them Jan. 1, 1900 when he started work in the factory at Newton, Mass. Later he became a salesman in the New York store; following this he opened the Philadelphia Locomobile business, and made a trip to the Orient. On his return he was manager of the Locomobile branch in Chicago, and Jan. 1, 1903, became manager of the New York branch. Mr. Plummer is one of the best known dealers in this city. It is not known yet what new enterprise Mr. Plummer will follow. His successor has not yet been appointed.

Premier Plant Sold to Syndicate

Offer of $125,000 Accepted—To Continue Manufacture of Premier Cars

INDIANAPOLIS, IND., Dec. 1—The plant of the Premier Motor Mfg. Co. has been sold to a syndicate represented by F. W. Woodruff, banker, of Joliet, Ill., for $125,000, the sale being confirmed by the court here to-day. The bid of the syndicate for the property, which included all the plant except the real estate, was filed with Frank E. Smith, trustee in bankruptcy of the company, who announced on Saturday that the plant had been sold.

The interests represented by Woodruff propose to re-finance and to revamp entirely the Premier organization and to continue the manufacture of the Premier car. It is understood that sufficient capital is back of the organization to make the Premier concern an important factor in the industry.

1 Year in Receivership

The financial difficulties of the Premier company date from December, 1913, when arrangements were first made with the creditors. The receivership which has just terminated with the sale of the property dates from Oct. 15, 1914, at which time Frank E. Smith was appointed receiver. On Dec. 15 Mr. Smith was elected trustee of the organization and has been looking after its welfare ever since.

Carload Shipments Gain 100%

DETROIT, MICH., Dec. 1—An important meeting of the directors of the National Automobile Chamber of Commerce is in session here to-day at the Detroit Athletic Club. While complete report of the deliberations cannot yet be obtained, General Manager Alfred Reeves says that the committee has the matter of Safety First under consideration and that a report to the gathering indicated that carload shipments of automobiles have increased 100 per cent over a year ago. It has practically been definitely decided to fix the standard tread at 56 in. for all sections of the country, discontinuing the 60-in. width which has been supplied to Southern trade.

—

Dayton Resigns from New Era

JOLIET, ILL., Nov. 26—W. O. Dayton has resigned as chief engineer of the New Era Engineering Co., this city and has organized a company for the manufacture of light automobile chassis and light worm drive axles for local and export trade.

Tax Coal, Wood, Electricity, Oats, Hay—if You Tax Gasoline

Washington's Proposed Tax of 1 Cent Per Gal. on Gasoline Is Class Legislation—Automobile Organizations to Fight It—General Opposition to Measure

NEW YORK CITY, Dec. 1—The federal government's proposal to raise a part of its extra revenue of $112,000,000 by placing a tax of 1 cent a gallon on gasoline used, and also placing a tax on motor vehicles, according to horsepower, which was first mooted a year ago, has again been voiced by Secretary McAdoo. This amount of additional revenue is claimed to be necessary for the fiscal year ending July, 1917.

825,000,000 Gal. Used

On the present schedule of car production there will be approximately 3,000,000 cars in America July 1, 1916, this figure covering passenger cars only. On a conservative estimate these passenger cars will consume 825,000,000 gal. of gasoline per year, this being based on an average mileage of 5000 per car, and assuming that 1,500,000 cars will average approximately 20 miles per gallon, and that the remainder of the cars will average 15 miles per gallon. This fuel average is too high but makes the figures proportionately conservative. On this basis of calculation passenger cars alone would produce a revenue of $8,250,000.

But a tax of 1 cent a gallon will fall on every commercial motor vehicle and it is impossible to estimate the fuel consumption of these. Further, there are hundreds of thousands of stationary engines using gasoline, these being in grain elevators, on farms, in factories, and hundreds of other places. Further, there are thousands of traction engines employed on farms, and in other vocations using gasoline. Yet again, there are tens of thousands of gasoline farm tractors using this fuel.

Of National Importance

In a nutshell, gasoline is no longer a fuel used for the transportation of the rich but is as essential to-day for the carrying on of the nation's work as kerosene is for lighting purposes, in our farming communities. It is just as unfair to tax gasoline as it would be to tax kerosene. It is practically as unfair to place a tax of this nature on gasoline as it is to place a tax on food supplies.

Why tax the gallon of gasoline and not tax the kilowatt of electricity? Electricity is used to-day for lighting, and for power. There is no difference, at least there should not be any difference between the manufacturer who transports his products to the railway station on an electric truck and that maker who uses a gasoline truck. The government apparently fails to see this and will tax gasoline but not electricity.

There is no difference between the farmer who uses the small electric motor to pump his water, and the other farmer who uses a small gasoline engine for this work.

There is no difference between the farmer who uses a steam engine to thrash his grain and the other farmer who uses a gasoline engine, excepting that the government would tax the use of gasoline for this purpose and let the use of steam go free.

The electric trolley car would go untaxed, the steam railroad train would go untaxed, and yet the up-to-date gasoline railway car and the combination gasoline and electric railway car, which is proving a paying investment to scores of our railroads would be taxed. The gasoline launch would be taxed but the steam launch let go untaxed.

Many Misconceptions

It is to be granted that additional revenue has to be raised but this should not be raised in the form of class legislation of a type that is highly discriminatory. It has been apparently conceived that the automobile industry is a fabulously wealthy industry because excessively large dividends have been declared by three or four companies. It is true that perhaps six or seven companies have declared excessive dividends, but while this is true there are scores of other companies that barely exist. The entire industry should not be estimated by the success of a few companies, but rather on the success of the masses. We have had 400 failures in the industry. These are lost sight of in the success of a few.

Further, it has been argued that practically one State, namely, Michigan, produces all of the cars in the country. This is far from the truth. The automobile industry is not local to Michigan. A horsepower tax will not mean saddling a load on Michigan, rather it will be a tax distributed over all the States, as the buyer will have to pay it.

Cars Overtaxed Already

Vehicles have as much right to pay special taxes for revenue purposes as any other departments of our country, but why discriminate among classes of vehicles? If it is right to tax one type of vehicle then it is equally right to tax all types. The motor vehicle is no longer a vehicle of pleasure or luxury. It is a vehicle of necessity. It is the greatest asset in the present war. It is one of the greatest influences of the present century. Already in many States the motor vehicle is taxed three times: First, there is the State registration; second, comes personal property tax, and third, there is the wheel tax in a few States. To these three would be added two others by the present suggestion, namely, a tax on all gasoline, and also a tax on horsepower.

N. A. C. C. to Fight Measure

Already the National Automobile Chamber of Commerce has been collecting valuable information to present to the government in opposition to this gasoline and horsepower tax. These arguments will be presented in Washington at the proper time. The chamber will endeavor to show how the automobile industry is a national industry and not one local to any State.

Already dealers' organizations in different cities are taking up the fight. The Boston Automobile Dealers' Association has taken the ground that if a horsepower tax were placed on automobiles it would be largely saddled on the dealers who would have a difficult task in passing it along to the consumer. The Boston dealers sent a commission to Washington on the matter a year ago and they are at present ready to send another delegation to the capital when the occasion demands it.

Gretzer Avery Advertising Mgr.

LOUISVILLE, KY., Nov. 27—T. N. Gretzer, former advertising manager of the Hart-Parr Co., Charles City, Iowa, has been appointed advertising manager of B. F. Avery & Sons, tractor manufacturers in Louisville, Ky.

Magneto Makers Settle Suits

Bosch and Splitdorf Companies Effect Amicable Termination to Patent Litigation

NEW YORK CITY, Nov. 30—Magneto patent suits instituted about two years ago between the Bosch Magneto Co. and the Splitdorf Electrical Co. have been amicably terminated. In two suits by Bosch against F. A. Baker, who sold Splitdorf-equipped motorcycles, Splitdorf recognizes the validity of the Bosch patents. In one suit by Splitdorf against Bosch, Bosch recognizes the validity of the Splitdorf patent. It is stated that this ending of the litigation will have no great effect, because both companies some time ago discontinued the use of the alleged infringing constructions.

One suit, Bosch vs. Baker (Splitdorf), was upon Bosch patent No. 974,967, covering magneto ignition in V-type gasoline engines.

The other suit, Bosch vs. Baker (Splitdorf), was upon the Gottlieb Honold patent, No. 900,542, covering a construction which gave a prolonged high-tension spark with a high-tension magneto.

The suit, Splitdorf vs. Bosch, was upon patent No. 1,074,416, covering a means for changing the polarity of the armature to coincide with the polarity of an external current during the time that the primary winding on the armature is coupled with the external source of current. All three suits were in the United States district court in this city.

—

Franklin Travels 1046 Miles on 1 Gal. of Oil

NEW YORK CITY, Dec. 1—Reports of a road test on a Franklin car to determine gasoline and oil consumption have been issued by the Technical Committee of the Automobile Club of America. The test was carried out over the roads between New York and Chicago, the car traveling by way of Albany, Utica, Syracuse, Buffalo, Erie, Cleveland and Kendallville. The mileage was checked on the odometer of the car and on accepted route maps.

All sorts of roads and weather were encountered along the way, sunshine, rain and snow being parts of the program. The total net running time was 60 hr. and 18 min. and the elapsed time 67 hr. and 37 min. The running average was 18.9 m.p.h.

During the trip 68.3 gal. of gasoline were consumed making an average of 16.7 miles per gallon. The gravity of the gasoline varied from 58 to 63 deg. Baume. The total oil consumption was 1.09 gal. or 1046 miles per gallon. The oil used is known as Quaker State medium made by Phinney Bros. Oil Co., Oil City, Pa. The car was fitted with a five-passenger sedan body and was stock in every way. All-weather non-skid tires were used and gasoline was fed by the Stewart vacuum feed system.

—

Fostoria Light Car Takes Over Storm Buggy Co.

FOSTORIA, OHIO, Nov. 26—The Fostoria Light Car Co., recently incorporated with a capital of $500,000, has taken over the holdings of the Fostoria Storm Buggy Co., capitalized at $100,000.

The company will occupy the entire two-story brick building on South Poplar Street which has been occupied jointly by the two companies and has a 300-ft. frontage on South Poplar Street. The building contains 34,000 sq. ft. of floorspace.

—

U. S. Has New Anti-Skid

NEW YORK CITY, Nov. 30—The U. S. Tire Co. has developed a new non-skid tire called the Union tread which will sell at a price approximating that of the plain tread casing.

—

Johnson Is Klaxon Factory Equipment Manager

NEWARK, N. J., Nov. 30—Charles Johnson, who has been special representative of the Lovell-McConnell Mfg. Co., in Detroit, has been made factory equipment manager for the entire United States. All factory equipment business will hereafter be transacted through the Detroit branch of the company.

—

Griffin a Maxwell Representative

LOS ANGELES, CAL., Nov. 24—J. G. Griffin, formerly a newspaperman of this city, has been appointed special Western factory representative of the Maxwell with headquarters in San Francisco. Mr. Griffin is to cover the entire territory under T. J. Toner, national sales director for the Maxwell in the West. This territory includes Washington, Oregon, California, Utah, Montana, Idaho, Arizona and Nevada.

—

Jaffess' Harrison Assets on Block

HARRISON, N. J., Dec. 1—All the assets and effects of Leon Jaffess in this city, a dealer in second-hand rubber, tires, tubes, etc., at 400 North Fifth Street, will be sold at auction on Dec. 10 by the receiver, L. G. Beekman. Mr. Jaffess, who had stores in New York City, Detroit, and Cleveland and a plant in Plainfield, made an assignment for the benefit of creditors last September.

Gasoline Prices Keep Rising

—

Selling at 24.5 Cents a Gal. in New Mexico—Further Rises Predicted

NEW YORK CITY, Nov. 30—Gasoline prices are continuing their upward movement with another 1-cent rise, effective in all sections of the country. The latest advance is that of Louisville where the tank wagon price has been raised 2½ cents a gallon to 17 cents. The price to garages in large lots is 16 cents.

Advance in Indiana

Independent oil interests state that the Standard Oil Co. of Indiana will advance gasoline 1 cent this week to a basis of 15½ cents a gallon, tank wagon, and refined oil ½-cent to 7½ cents a gallon.

Higher in Milwaukee

Milwaukee jobbers have advanced the price 1 cent, making an increase of 2 cents within 30 days. The withdrawal of quotations for lots of 100 gal. or more, has had the effect of increasing the price in large lots 3 cents since Oct. 25. In this city, the prices range from 14.6 cents a gallon for the 59 deg. specific gravity, to 22 cents a gallon for the 70 deg. specific gravity.

Highest in New Mexico

In Arizona and New Mexico the tank wagon price at certain points is as follows: Tucson, Ariz., 21.5 cents; Douglas, Ariz., 21 cents, and Santa Fe, N. M., 24.5 cents. Incidentally these prices are about the highest in the country.

21 Cents in New York

Automobile owners in New York City are now paying 21 cents a gallon for their gasoline. The tank wagon price is 19 cents. In New Jersey, the prices range from 19 to 21 cents a gallon.

Fight in St. Louis

The prices in St. Louis vary on account of the fight between the S. O. and the Independents. Last week the Standard Oil Co. raised the price 1 cent to 13.9 cents. The Independents, determined to maintain their 1-cent lead over the Standard, in turn raised their price to 15 cents at filling stations. Independents in that city declare the price of gasoline in Missouri within the next few months and perhaps only weeks will be brought back to where it was before the so-called war between the Standard and the Independents began. A Federal investigation into every branch of the oil industry in Missouri and several States is now in progress.

Louisville owners, who have been buy-

ing their gasoline in 1000-gal. lots, receiving a book of tickets in which each ticket called for a certain number of gallons, are now in a quandary as to whether to buy their books at the now inflated prices or to wait for a slump. Prices took another jump last Saturday when an advance of 2½ cents brought the price up to 20 cents a gallon. The cost per gallon as late as the middle of August was 11 cents.

—

International India Rubber Corp. Formed with $1,000,000 Capital

SOUTH BEND, IND., Nov. 26—The International India Rubber Corp., this city, with a capital of $1,000,000, has been granted a charter to manufacture automobile tires. P. E. Studebaker, son of the late Henry Studebaker, is to be president; E. H. Schwab, manufacturer of Bethlehem spark plugs, is to be vice-president; G. W. Odell, formerly with the Toledo Ford Tire Co., Findlay, Ohio, is to be secretary and general manager; J. R. Nobile will be treasurer.

The company has opened temporary offices in the Union Trust building and has taken an option on real estate in South Bend for a factory site, it being the intention of the management to erect its own buildings as needed from time to time.

The $1,000,000 stock is divided equally between the common and the preferred, there being $500,000 of each. The preferred stock is 7 per cent.

The company, aside from the fact that it is to produce tires, has a unique and original selling plan. A part of the 7 per cent cumulative and protected preferred stock will be distributed at par for the purpose of establishing selling branches. These selling branches will be widely distributed and will be devoted to advertising and selling the product. It is the intention of the company to have, by the time its buildings are erected, and its plant is equipped, at least 500 branch establishments.

—

Detroit S. A. E. Banquet Dec. 4

DETROIT, MICH., Nov. 29—Chairman George W. Dunham of the Detroit Section of the Society of Automobile Engineers, is sending out invitations to the executive heads, manufacturers and factory managers of all the automobile manufacturers in the United States, to be present at the banquet which the Detroit section will give Dec. 4, and which marks the climax of this year's activities of the society. In addition to the president and council of the Society of Automobile Engineers, members from the New York, Indianapolis, Chicago and Cleveland sections are expected to be present.

The principal speaker at the banquet will be Isaac F. Marcosson, whose subject will be "The War and Business."

$845 Elgin Six in Field

—

New Chicago Product Has 3 by 4¼-In. Motor—Two Body Styles

CHICAGO, ILL., Nov. 29—In the Elgin Motor Car Corp., Chicago has its second automobile factory, and the product—the Elgin six at $845—will be at the show here in January. Organized last spring, the Elgin Motor Car Corp., with a capital stock of $1,000,000, one-half of which is subscribed for or pledges made guaranteeing subscription, has brought its plans to a focus in the new six-cylinder car that is about to be placed on the market.

The building that will be used is adjacent to the concern's site in Argo, a suburb of Chicago, having immediate access to two belt lines that connect with all railroads in the city, which will make shipping facilities all that is to be desired.

Personnel of the Company

The official personnel of the corporation includes Frederick L. Brown, of Crandall & Brown, Chicago lumber firm, president; C. S. Rieman, formerly vice-president and general manager of the Service Motor Car Co., vice-president; W. G. Knoedler, president of the Argo State Bank, treasurer; and J. Jerome Kluge, secretary. The directorate includes the president, vice-president and treasurer, together with David Schnitzler, branch manager of the Mutual Life Insurance Co. of New York; J. M. Snitzler, president and treasurer of the Snitzler Advertising Co., Chicago, and Dr. A. L. Tull, Chicago. John A. Schroeder, formerly with the Hyatt Roller Bearing Co. is production manager and Reed & Glaser, Indianapolis, Ind., consulting engineers.

The production plans call for an output of 1000 cars by Aug. 1, 1916, delivery to begin in January and proceed on a graduated scale. It is to be strictly an assembled car.

The power plant embraces a six-cylinder Falls motor with overhead valves, and cylinders having a 3-in. bore and a 4¼-in. stroke, block cast. It is rated at between 30 and 35 hp. The motor has three-point suspension and a combination of force feed and splash is used. Cooling is by thermo-syphon. The ignition distributer and switch is of the Delco make and the starting and lighting is by the Dyneto system.

Two body styles are offered on the one chassis, which measures 114 in. The touring model will accommodate five passengers, and is of the yacht-line design with concealed hinges and flush type door locks. Upholstery is in long grain black leather, with deep backs and slanting cushions. It is equipped with foot and robe rails and is finished in black.

The roadster will be of the clover leaf seating arrangement and aside from the color the finish of this body does not differ from the touring model. The color of the roadster will be Elgin gray with yellow running gear.

—

No Change in General Vehicle Co. Management

NEW YORK CITY, Nov. 26—P. D. Wagoner, president of the General Vehicle Co. Inc., Long Island City, N. Y., which, with the Peerless Motor Car Co., Cleveland, Ohio, recently became a subsidiary of the Peerless Truck & Motor Corp., states that the new interests will not in any way change the company's operating management or affect its relations with customers. There will also be no change in the company's manufacture of electrical apparatus and it will continue to devote its energies to the development of the electric vehicle business. The manufacture and marketing of the Mercedes truck will also be continued. The 5-6-ton size is now in production and arrangements are being made for the other sizes to go into production shortly. The company is also planning to actively engage in the manufacture and sale of the Mercedes aeroplane motor.

—

3500 Beaver Motors for Sun

MILWAUKEE, WIS., Nov. 26—The Beaver Mfg. Co., this city, has received an order to build 3500 special motors for the Sun light six to be put on the market Jan. 1 by the Sun Motor Car Co.

R. C. Hoffman, designer of the motor, and engineer of the Sun company, stated, "We have incorporated in our motor the latest developments and have obtained what may really be termed the American type high-speed motor.

"For instance, we have eliminated the push rods and the motor can easily run up to 3000 revolutions."

—

Several Additions in Detroit

DETROIT, MICH., Nov. 29—While nothing striking has been announced in the way of new plants or additions by local manufacturers during the last few days, reports from building contractors show that quite a number of minor contracts have been awarded. The Cadillac Motor Car Co. is to have a two-story steel frame addition to its plant on Cass Avenue, while a small addition to connect two buildings at its Fort Street plant will be put up there. A one-story frame addition, as a storage building, is to be put up for the Columbia Casting Co., o

Summit Avenue. The Detroit Steel Products Co., has contracted for a one-story steel frame storage building. Bids for an addition to the plant of the C. M. Hall Lamp Co., are being received. A one-story brick addition will be erected for the Detroit Steel Castings Co. The total expenditure for all these additions will be less then $10,000.

—

2-Ton Acme Truck, $2000

CADILLAC, MICH., Nov. 26—The Cadillac Auto Truck Co., this city has brought out under the name of Acme a 2-ton truck, which is to be the first of a complete line. This machine uses a type C 4⅛ by 5¼ four-cylinder Continental motor developing 40 brake hp. From the motor the drive is taken through a Warner multiple dry disk clutch and three-speed selective gearset used with heat-treated alloy steel gears of 1-in. face, a two-piece driveshaft with three universals supported in the center on self-aligning ball bearings, giving straight line drive to the Timken-David Brown worm gear rear axle. No radius rods or torque members are used, the top leaf of the springs being special alloy steel to take both torque and thrust. Service and emergency brakes are internal expanding and the Pierce governor is locked and sealed, limiting speed to 1200 r.p.m., or 17 m.p.h. The wheelbase is 148 in. and tread 58½. The chassis is 217½ in. over all and the loading space is 128 in. Front tires are 36 by 4 and rear 36 by 6, dual tires being furnished when desired. Some features of equipment are: Detroit springs, Gemmer steering gear, Eisemann magneto, Rayfield carbureter and Long truck radiator. The wheels are of artillery type.

—

Prudden to Double Plant

LANSING, MICH., Nov. 26—It is reported in the city that the W. K. Prudden Co., which is one of the biggest automobile wheel manufacturers in the country will double its plant, and possibly erect an entirely new one. This concern's business has increased steadily during the past twelve months, and it is a necessity with it to enlarge at once as otherwise it will not be possible to take care of the increased business.

—

K. C. Tire To Open Feb. 1

KANSAS CITY, MO., Nov. 24—The Kansas City Rubber Tire Corp., which last week purchased the old Riverside Iron Works plant in Kansas City, Mo., announced this week that it will start its plant working by Feb. 1. Present plans contemplate giving employment to 500 persons, including expert tire-makers who will come from the East.

Packard Motors For Aeroplanes

—

Twin-Six Type Found Most Suitable After Experiment—For U. S. Defense

DETROIT, MICH., Nov. 26—For about a year, after the European war had been going on for some time and the value of the aeroplane to the armies had been amply demonstrated, Henry B. Joy, president of the Packard Motor Car Co., thought that the time will come when the United States government will need a fleet of aeroplanes.

Tests to Continue

Experimental work was started quietly by the engineers of the Packard company, with Packard motors, and after much testing it was found by them that the twin-six motor was best adapted for aeroplane purposes. Now it is announced by President Joy that the Packard company will build such motors. The tests will continue, however, and full particulars as to the motor will not be given for some time. It might be said, however, that the Packard aeroplane motor will be in general principle similar to the twin-six passenger car motor.

To Help Government

The decision to build motors for aeroplanes was due principally to President Joy, although all the members of the board of directors of the company, when sounded on the subject, were strongly in favor, because the principal object in making such motors is that of helping the United States government in preparing for a fleet of aeroplanes.

In speaking on the subject, President Joy said in part as follows: "It is probably a little out of the ordinary for a corporation to go out of its way to produce such military devices as aeroplane motors, because the demand for them will probably be very uncertain. Yet our directors feel that it is a part of the very important duty of manufacturers in this country to mobilize their facilities into such form that they might be available in time of need. We are inclined to feel that our government is going to find important need of co-operating in the development of what would be the serious wants of our country in time of military trouble, in case such an unfortunate condition should come to pass.

A Manufacturer's Duty

"I feel that I have understated the proposition as to the views which our directors hold of the duties of manufacturers in this country to work in co-operation with the government officials so that we may be ready for any emergency. Our company feels that it is its duty to carry on this work toward the condition of military preparedness which all our directors thoroughly believe is the important necessity of the day.

"We are engaged in seeking to develop aeroplane motors, in the neighborhood of 100 and 200 hp., for light scout aeroplanes and heavier duty aeroplanes."

—

Olds Distributors at Factory

LANSING, MICH., Nov. 27—Distributors for the Oldsmobile were guests of the Olds Motor Works during several days at the plant. Many came with their service managers. As in the instance of the branch managers' and road men's convention, prominent parts makers or their representatives came to give talks to the men about parts or equipment.

During the two days the convention lasted the visitors were addressed by Sales Manager J. V. Hall, who made the statement that once the point of saturation is reached in the automobile market, and the supply of cars exceeds the demand, the success of the retail dealer as well as the manufacturer, will depend upon his ability as a merchant. Assistant sales manager N. W. Barton spoke of improved methods in marketing automobiles. Chief Engineer F. Sergardi gave a detailed talk about the Oldsmobile chassis and engine and explained the numerous mechanical improvements adopted within the past year. Advertising manager C. V. McGuire talked about "atmosphere" in advertising. Service manager F. C. Hill talked about the Oldsmobile service. W. H. Mooney, installation engineer of the Dayton Engineering Laboratories, builders of the Delco starting and lighting system, spoke on the subject of multi-cylinder ignition. H. W. Farr, representing the Johnson Carbureter Co., gave a lecture on carburetion.

Builds 2½-Ton Truck

DULUTH, MINN., Nov. 24—Hugh Miscampbell, owning a machine shop at 304 South First Street, has begun manufacture of a 2½-ton motor truck. It will sell for $2,700. The truck is yet unnamed.

—

Ware Truck Plant Under Way

ST. PAUL, MINN., Nov. 24—Construction has begun for the new factory of the Four Wheel Drive Co. of the Twin Cities. The building is to be two stories with basement, foundation being heavy enough for a total of four stories. The present contract is for $51,000. The building will face 200 ft. on University at Pelham Street, two blocks from the new Overland plant, St. Paul. It will be ready by March 1, 1916, for the manufacture of Ware motor trucks.

Two Land Deals in Cleveland

Baker R. & L. To Build New Plant—Rollin White Plans Tractor Factory

CLEVELAND, OHIO, Nov. 30—Two important purchases of land have been made during the past week in this city by local automobile makers. One tract of land at Euclid Avenue and Lamb Avenue, Euclid, consisting of 38.67 acres has been purchased by Rollin H. White, who will erect at once a $200,000 factory in which he will manufacture tractors. The second tract of land, consisting of approximately 104 acres near the National Carbon works at Madison Avenue and West 117th Street, has been bought by the Baker-Rauch & Lang Co.

The White property in Euclid is to be improved with factory buildings which are to be erected in sections. The first section, as was stated, will cost $200,000. The remainder of the buildings are to be erected as rapidly as wanted. All are to be occupied by a company headed by Mr. White for the manufacture of a farm tractor and other power farm machinery invented and patented by Mr. White.

The Baker-Rauch & Lang Co. plans to erect, it is said, a modern factory building, so arranged that the cost of production will be greatly reduced. The American Ball Bearing Co., which now occupies a plant adjoining the Baker factory, will either move to the new site or occupy the Baker plant when vacated, it was reported.

Overland Factory Branch in K. C.

KANSAS CITY, MO., Nov. 26—The Willys-Overland Motor Co. has bought the four-story building occupied by its distributing agency at Twenty-first Street and Grand Avenue and 75 ft. adjoining for the purpose of erecting a factory branch for the Southwest. The company plans to add two stories to the present building and to continue the six-story structure over the entire area. The new factory branch will cost in the neighborhood of $500,000.

Wisconsin Truck Move Completed

SHEBOYGAN, WIS., Nov. 26—The incorporation of the Myers Machine Co. of Sheboygan, Wis., with a capital stock of $50,000, is the final step in the removal of the Wisconsin Motor Truck Co. of Baraboo, Wis., to Sheboygan, Wis. The Baraboo concern was established about three years ago by Louis P. Helm and some time ago Mr. Helm opened negotiations with several of the larger cities of Wisconsin for removal. George P. Myers, who has been operating a large machine shop and works at Sheboygan, Wis., for several years, became interested and upon the conclusion of negotiations, the incorporation of the Myers Machine Co. followed. A large addition will be erected at once to accommodate the Baraboo works. The new building will be 75 by 75 ft., two-story and basement. The Myers company will continue to manufacture woodworking and special machinery under the direction of Mr. Myers, while the motor truck manufacturing department will be conducted by Mr. Helm. Numerous improvements are being made in the design of the truck, chief among which is the adoption of worm drive. Other details of the truck will be made public later.

Sparks-Withington to Add

JACKSON, MICH., Nov. 26—A one-story shipping room, 40 by 90 ft. will be erected by the Sparks-Withington Co., manufacturers of the Sparton warning signals. A two-story building, 40 by 90 ft. is also being erected to be used as washroom and locker room. There are 500 men now on the pay-roll, there being two working shifts. Business is far ahead of last year's and the outlook the best since the company started in business.

Motor Co. for Oshkosh

OSHKOSH, WIS., Nov. 26—The Lake Breeze Motor Co., Chicago, Ill., recently organized to build gasoline engines, has completed arrangements with the Chamber of Commerce of Oshkosh, Wis., to make that city its permanent headquarters. The removal of the shops from Chicago to Oshkosh will be undertaken at once and the new plant be ready for operations about April 15.

Allen Employees Insured

TOLEDO. OHIO, Nov. 27—The Allen Motor Co., Fostoria, Ohio, has insured the life of every employee in its Fostoria and Bucyrus plants.

To Sell Tire Plant

EAST LIVERPOOL, OHIO, Nov. 26—The plant, together with all of the equipment of the Morgan-Marshall Co-operative Rubber Tire Co., in this city, will be offered at public sale by Sheriff Crawford at an early date. It has been appraised at $60,000 and will be sold on the premises.

Makes Sheet Metal Parts

MILWAUKEE, WIS., Nov. 26—The American Brewers & Bottlers' Specialty Co., this city, is manufacturing automobile parts such as fenders, hoods, gasoline tanks, etc.

Ford Plans Eastern Factory

Buys 80-Acre Tract Near Newark—Begin Three More Assembly Plants

NEWARK, N. J., Nov. 26—The Ford Motor Co. has purchased a tract of 80 acres near this city, upon which a large Eastern plant will be established.

Newark has excellent railroad facilities which appealed to Mr. Ford more than anything when he visited that city on an inspection trip last summer. It is stated that Mr. Ford has not been satisfied with the railroad facilities in Detroit and has been desirous of building an Eastern plant where a big savings in freight rates can be made. Added to this the export trade of the company can more easily be taken care of by means of an Eastern plant from which its cars can go direct to the docks.

Begin Work on Three More Ford Assembly Plants

DETROIT, MICH., Nov. 24—Nearly $1,000,000 are being spent by the Ford Motor Co., for the construction of three new assembling plants and service stations, in Milwaukee, Wis., Omaha, Neb., and Oklahoma City, Okla. This brings the number of assembling plants of the company to a total of twenty-eight.

The Milwaukee five-story structure, 120 by 300 ft., will cost $385,000 and will have a production capacity of seventy-five cars a day, with a working force of 400 men. The Omaha plant will be a five-story structure 120 by 284 ft., to cost $375,000. About 400 men are to be employed and seventy-five cars will be assembled a day if necessary. A four-story building, 132 by 275 ft. will be put up in Oklahoma City, having an output capacity of sixty cars a day with a working force of 300 men. The plant will cost $230,000. The Wisconsin plant is to be ready in February, also the one in Omaha. The one in Oklahoma is expected to be opened in May.

In St. Louis the Ford assembling plant is being doubled and in Kansas City the plant is being tripled.

Tire Co. in Eau Claire

EAU CLAIRE, WIS., Nov. 26—The Gillette Safety Tire Co., Chicago, Ill., a corporation capitalized at $1,000,000, has selected the city of Eau Claire, Wis., as the permanent location of its offices and works. The company has purchased, with the aid of the Eau Claire Commercial Club, a site 150 by 300 feet, formerly occupied by the mills of the Northwestern Lumber Co., and will build a modern, fireproof factory at once.

Studebaker Sales $46,851,349

To Sept. 30 Net Earnings Were $7,937,549—Net Profits $7,082,558

NEW YORK CITY, Nov. 30—The income account of the Studebaker Corp. for the nine months ending Sept. 30 shows net sales of $46,851,349, total net earnings of $7,937,549 and net profits carried to surplus of $7,082,558. The total surplus for the twelve months in 1914, after the preferred dividends, was $3,572,916. Earnings for the nine months were equivalent to about 23 per cent on the common, or over 30 per cent for the year, if no increase in net occurred in the December quarter.

The cost of manufacturing and selling and general expenses amounted to $38,857,339 and the reserve for depreciation was $298,471. The net earnings on sales was $7,695,539. Other income amounted to $242,010.

The consolidated balance sheet as of Sept. 30, 1915 follows:

Assets	
Trade name, good-will, patents, etc.	$10,807,276
Plant and property, less reserve for depreciation	12,076,870
Investments in other companies	452,449
Inventories at cost or under	10,493,553
Receivables:	
Accounts	6,034,678
Notes	1,745,626
Less reserves for bad debts and cash discounts	84,065
Cash	7,416,396
Deferred charges to operations	408,948
Total assets	58,351,733
Liabilities	
Preferred stock	$11,758,000
Common stock	27,931,600
Minority stockholders' interest in capital stock of subsidiary company (Studebaker Bros. Co., Northwest)	28,300
5 per cent serial gold notes, dated March 1, 1912, due $400,000 each half-year to March 1, 1922	2,308,500
Accounts payable current	2,835,823
Sundry reserves	1,233,354
Special surplus account	1,636,476
Surplus	10,619,678
Total liabilities	58,351,733

Receiver for Trumbull Car

BRIDGEPORT, CONN., Nov. 26—Upon an application made to Judge William S. Case in the superior court here on Wednesday, Judge Edward K. Nicholson was appointed receiver of the Trumbull Motor Car Co.

The petition to the court was made at the instance of Alexander H. Trumbull, president; Frank S. Trumbull, vice-president; James Trumbull and Robert B. Adams, stockholders.

It was agreed that Judge Nicholson should be receiver, and as there was no opposition he was named. He has been ordered to continue the business until Dec. 10, serving under a bond of $25,000.

Friday, Dec. 3, is the date fixed for a hearing upon the appointment and confirmation of the receiver, and for the naming of appraisers.

The company was organized about two years ago for the purpose of manufacturing small automobiles. The capital stock is $300,000, of which $170,000 has been paid in. There are 3000 shares of the par value of $100 each, of which the petitioners hold a half.

In the petition there is no mention of liabilities, though the assets are fixed at $150,000.

The late Isaac B. Trumbull, who lost his life on the *Lusitania*, was the most active spirit in the enterprise.

Rubber Lower

NEW YORK CITY, Nov. 30—Crude rubber had a sudden drop on Saturday, the decline coming as suddenly and abruptly as the rise a few weeks before. Plantation last week rose to 89½ cents a pound and Fine Up-River Para quoted at 76. Yesterday the Ceylon grade and Para were quoting at 75 and 68 respectively. These figures compare with 60 and 55 cents, the quotations that had prevailed for some time prior to the beginning of the upward movement. The sharp break is attributed to the withdrawal of nearly all substantial buyers.

Few changes occurred in the rest of the markets and prices were fairly steady throughout the week. The metals were especially firm with an extraordinary demand. Electrolytic and Lake coppers held firm at 19¾ cents a pound. There was a heavy demand for lead from domestic consumers with prices steady at $5.25 per 100 lb. Bessemer steel went up $1 a ton on Thursday, closing at $28. Aluminum held steady at 57 cents a pound with a heavy demand. Tin closed at $40 per 100 lb. at a gain of 50 cents.

Consolidated Capital Now $500,000

DETROIT, MICH., Nov. 30—The Consolidated Car Co., which was organized in January and took over the business of the old Abbott-Detroit company, has increased its capital stock to $500,000. Its original capital was $100,000 which was later increased to $250,000. The company contemplates increasing its manufacturing facilities.

Change in Bell Personnel

YORK, PA., Nov. 27—At a meeting of the board of directors of the Bell Motor Car Co. on Nov. 19, a slight change was made in the personnel of the officers of the company which is now as follows: H. M. Stauffer, president and business manager; H. W. Posey, vice-president and general manager; B. F. Posey, secretary and treasurer; E. T. Gilliard, designer and chief engineer; H. W. Conrad, assistant general manager and sales manager.

Kelly-Springfield Reduces Common Par Value to $25

NEW YORK CITY, Dec. 1—At a special meeting of the stockholders of the Kelly-Springfield Tire Co., in Jersey City, the proposed reduction in the par value of the common shares from $100 to $25 was authorized. Common stockholders were also given the voting privilege of one vote for each share of a par value of $25, while the preferred stockholders, to equalize the voting power of both classes of stock were given the right of four votes for each share of preferred stock held by them.

Receiver for Dreadnaught Tire

BALTIMORE, MD., Nov. 27—Eli Frank has been appointed receiver for the Dreadnaught Tire Co., this city upon application by the Manhassett Mills Co., New York, a creditor to the extent of $20,000. The Dreadnaught company consented to the appointment. The attorney for the company says the assets are about $200,000 and the liabilities about $150,000 and the appointment of a receiver is only for the purpose of refinancing the concern.

Kennedy Represents Hammond Steel

DETROIT, MICH., Nov. 30—Don F. Kennedy, manufacturer's agent of Detroit, has arranged to take over the sales in the Western part of the country of the Hammond Steel & Forging Co., Inc.,

Syracuse, N. Y., manufacturer of hammered tool steel bars, die blocks and special forgings, which arrangement will become effective Dec. 1. The present office of the company in the Dime Bank Bldg. here, will be discontinued. Mr. Kennedy also handles the accounts of the T. R. Almond Mfg. Co., and the Sawyer Tool Mfg. Co., Ashburnham, Mass.

—

Simplex Capital Now $5,000,000

WILMINGTON, DEL., Nov. 25—The Simplex Automobile Co. has filed a certificate to corporate amendment in Delaware to increase its capital stock from $1,500,000 to $5,000,000.

—

Gerlinger Co. Doubles Capital

SEATTLE, WASH., Nov. 26—The Gerlinger Motor Car Co., of Seattle and Portland, manufacturer of the Gersix truck, has increased its capital stock from $50,000 to $100,000, of which $51,000 already is paid in.

—

Dividends Declared

Yale & Towne Mfg. Co. quarterly of 1¾ per cent and an extra dividend of 5 per cent. Regular payable Jan. 3 to holders of record Dec. 22, and extra payable on Dec. 23 to holders of record Dec. 8.

Packard Motor Car Co. quarterly of 1¾ per cent on preferred, payable Dec. 15, to holders of record Nov. 30.

—

Sta-Tite Now Keys Piston Ring Co.

ST. LOUIS, MO., Nov. 26—The Sta-Tite Packing Ring Co. has changed its name to the Keys Piston Ring Co., and the name of its product to the K-P ring.

Automobile Stocks Are Dull

—

General Motors Soars to 463 and Paige Reaches High Mark of 700

NEW YORK CITY, Dec. 1—Automobile stocks were dull but firm last week. A majority of the issues remained unchanged. However, there were a few, such as General Motors, Paige-Detroit, Maxwell, Willys-Overland, Studebaker and Packard, which showed substantial rises.

General Motors soared to a new high price yesterday when it sold for 463, almost 400 points higher than the quotation a year ago. At the present prices trading in this stock is a luxury few can indulge in. Odd lot houses refuse to take orders in the issue at all except for cash. Paige-Detroit stock, which showed a 110-point rise last week kept up its skyward movement by reaching the 700 mark with a 40-point gain. Packard common, after a 1-point decline last week, went up 10 points, closing on Saturday at 140. Maxwell common rose 2½ points. The two preferred were dull during the first part of last week but picked up at the closing on Saturday. Willys-Overland closed at 240 yesterday, nearly 170 points higher than last year's quotation. On Saturday this stock was quoting at 230. Studebaker showed a gain of 3 points. This stock fluctuated throughout the week, hovering around the 154-point mark.

General Motors and Paige featured the Detroit active stocks. The first stock gained 35 closing at 440 while the second reached the 700 mark with a 25-point gain. There were a few 1-point declines and most of the gains ranged from 1 to 5 points.

—

Chase Names Directors

SYRACUSE, N. Y., Nov. 16—Close on the heels of the recent meeting at the Chase Motor Truck Co.'s plant here, comes the announcement of the election of the directors to serve for the next year. They are as follows: A. M. Chase, president and general manager of the company; Col. A. C. Chase; L. O. Bucklin, president Little Falls National Bank, Little Falls, N. Y.; E. C. Witherby, general manager, Semet-Solvay Co., Syracuse, N. Y. and H. P. Bellinger, general manager Caustic Dept., Solvay Process Co., Solvay, N. Y.

—

Poor Resigns from S. K. F.

NEW YORK CITY, Nov. 16—F. H. Poor, who has been general manager for the S. K. F. Ball Bearing Co. of New York since 1909, has resigned that position and opened an office at 30 Church Street. This resignation, however, is merely a formal one, as the new S. K. F. Ball Bearing Co. of Connecticut is planning to absorb the old New York importing company, when it is expected that Mr. Poor will take another contract with the S. K. F. interests.

—

Hupp Co. Chartered in Virginia

RICHMOND, VA., Nov. 24—The Hupp Motor Car Corp. was chartered to-day under the laws of this State, with an authorized capital of $8,000,000. A. D. Christian of Richmond, is president, and H. H. Chalkley of Richmond, secretary.

Race Results Surprise Europeans

Endorse Engineering of Victorious Stutz Cars in Sheepshead Bay Contest

PARIS, Nov. 5—Results of the Sheepshead Bay race, which were not known in Paris until the arrival of THE AUTOMOBILE, have created more surprise than disappointment. Engineers and race drivers have some difficulty in understanding the failure of any European car to finish the race—for Limberg's Delage is thought to be Thomas's reconstructed machine and is no longer looked upon as a French car. No such failure has ever been known in a European race.

While giving full credit to Stutz for a fine performance, all French engineers point out that the motor of the winning cars are built up of many ideas gathered from Peugeot, Delage, Sunbeam and Mercedes racing cars. One racing engineer states that the motor can be described as a Franco-British-German design. "The train of spur gears driving the camshaft is a copy of the Peugeot; the crankshaft is a copy of Peugeot and Delage; the valves, camshaft, and rocker arms are Mercedes; the piston is Sunbeam, and the form of the combustion chamber is Mercedes. It would be childish to deny the value of the motor, for it embodies all the best features of European cars, and the result of the race shows that workmanship was of the best.

All the evidence shows that the European motors, despite their smaller capacity, delivered more power than the American motors. The fastest time for 20 miles was made by Aitkin on Peugeot in 11 min. Resta did 11.02, 11.06, and 11.10. The fastest time made by Stutz was 11.25, while De Palma's Stutz never did better than 11.40. Thus between the best Stutz and the best Peugeot performance there is a difference of 3.08 miles an hour in favor of the Peugeot, although the French car had 22 cu. in. less than the American motor.

Metals Worked Near Limits

"To maintain that the fact of the European cars having run in previous races is a guarantee that they are O.K. is to display a lack of knowledge of racing conditions, at any rate as we know them in Europe. The advantage in this respect was with the Stutz, which had not been raced before, and not with the European cars, all of which had been in one big race and some in several. Metals are worked so near their extreme limits that nobody can say when they will fail. We never run a car in more than two long-distance races, and they are never considered good for more than one season. It is a mistake to suppose that our cars start in a race after having done thousands of miles at highest speed. All the gruelling is taken by a special car, which is not started in the race, or is merely allowed to compete as a runner-up. The real racing cars have taken advantage of any experience gained in the try-out of the test car, but they have not done any more running than is necessary to put them in condition without straining them.

Approach Power Limit

"The statement that we are approaching the limit of power is quite correct. Unless some entirely new type of motor is evolved it is difficult to see how we can get more power and more speed. At the present time we are very close to the highest theoretical pressures, and future races will depend more than ever on good workmanship, details, and scientific preparation. Future races will be keener and the element of chance will be more important. It is worth while considering if it is not advisable to reduce the cubic capacity of racing motors. Just before war broke out Peugeot had on the road a set of racing cars of only 153 cu. in. These averaged 96.5 m.p.h. on the open road.

René Thomas, winner of the 1914 race at Indianapolis, considers that much of the responsibility for the failure of European cars to finish in American races lies with the American drivers. "It has to be noted," says Thomas, "that Resta can win races with Peugeot cars, while no American has proved himself capable of doing so. This seems to point the conclusion that it is not the fault of the car, but of the man who is handling it. American drivers have all the dash and vim that is necessary for winning races, but with a few rare exceptions they do not seem to possess the necessary mechanical ability to get their cars into the best condition for a race, and to keep them in the best condition while the race is on. Cars have been sent over and given to men who have had no previous experience with that particular make. They have no opportunity of getting the right gear ratio for the track on which they are to drive, they do not know at what speed that particular motor ought to be run, and in some cases they run without a revolution counter. It seems to me that American drivers run their cars in far too many races and do not do enough work on them between races. They also appear to expect racing cars to remain in racing condition much longer than is reasonable. Judging from their insuccess in the last two or three races, I should imagine that Resta's Peugeot and De Palma's Mercedes have finished their active career. This is not at all surprising. In Europe we consider that a racing car is good for one season, during which it will run in two long distance events and a few hill climbs and short distance races. After that it is sold to an amateur, or it can be used for sprints on a track.

"On this side the driver lives with the car from the time it is put on the drawing board to the moment it finishes its race. He goes through all the bench tests with the engineers and possesses all data concerning the motor. He knows at what speed it can run and at what speed it ought to be run in a race, and he would no more think of starting without a revolution counter than without water in the radiator. He may spend several weeks, or sometimes months tuning up, trying various gear ratios, carbureter and ignition adjustments, steering column positions, shock absorbers, springs, etc., so that when he starts he knows exactly what he can do and what the car can do in the race.

"Compare this with the system under which a driver is given a car a few days in advance and told to do his best. He may be a first class driver, but he cannot possess the knowledge necessary to get satisfactory results out of the car."

—

Autocar Men Hold Sales Conference

NEW YORK CITY, Nov. 30—The Autocar Co.'s sales conference opened on Nov. 26 in this city when ninety representatives of the company attended a dinner. The conference, which was called to map out means and methods of disposing of an increased production of Autocars next season, held a business meeting on the next day. The business of 1915 is said to have been 70 per cent greater than the year previous.

—

Schwartzkopf Joins Longuemare

NEW YORK CITY, Nov. 27—E. E. Schwartzkopf, former sales manager of Gray & Davis, Boston, has joined the Longuemare Carbureter Co., New York City, in a sales capacity.

—

New Distributor for Gray & Davis

NEW YORK CITY, Nov. 24—The New York branch of Gray & Davis has been discontinued, and the P. J. Durham Co., Inc., has been made distributor of all Gray & Davis products for the Metropolitan district. H. B. Shonts, formerly with the C. T. Silver Co. has gone into the Durham company and will have charge of the sales end of the business.

—

100 Dodge Cars in Parade

BOSTON, MASS., Nov. 29—The best parade of motor cars ever witnessed in New England took place this morning when 100 Dodge Bros. cars were driven through the principal streets of the city. It was the first time that so many cars of one make were in a parade here, and

the features brought out by the owners produced some unique designs. The cars started from the salesrooms of the Henshaw Motor Co.

The decorative features were unique. One car was a duplicate of a submarine. Another was decorated with holly and ferns and carried Santa Claus with a lot of toys that he threw to children. Uncle Sam was in another car decorated with flags and bunting.

Others were covered with flowers to represent various seasons. More cars had occupants in military, hunters', football, harvest and opera costumes. One machine towed a buggy bearing signs "Gone, but not forgotten," and "Times have changed."

Three handsome silver cups each worth $100 were awarded to the owners of the best featured cars.

—

New Stock for Blood Men

ALLEGAN, MICH., Nov. 20—Stockholders of the Blood Bros. Machine Co. have received a circular from the managers of the company asking them to surrender certificates of stock to Earl W. Delano as trustee and acceptance of new stock for but 17½ per cent of their investment. It means that the balance or 82½ per cent represents a loss to the subscribers of the original stock. It is thought probable that the stockholders will agree to these terms and thus prevent a total loss. It is reported that the company has orders on hand for $80,000 worth of universal joints which will keep the factory busy for the next four or five months. About 100 men are now employed.

Setback for U. S. Cars in France

—

Agency Negotiations Affected by 33 to 45% Duty To Be Imposed

PARIS, Nov. 4—Negotiations for the French agencies of American cars have received a setback since it became known that the manufacturers here were assured of getting a substantial protective tariff. It is expected that the tariff is likely to be between 33 and 45 per cent. A meeting of the manufacturers' association a few days ago considered this question, but no decisions were allowed to leak out. As it is obvious that there will be a big demand for certain types of cars as soon as the end of the war is in view, and as it is equally certain that the home manufacturers will not be able to meet that demand for a time, enterprising dealers have been trying to connect with American firms. In view of the threat of a high import duty these negotiations have been suspended.

The only American firm doing a really important business in France is Ford, and if the threatened boycott can be warded off, this make of car should continue to sell well. Overland is making a bid for French custom, and the Buick line is now in the hands of a live agent. There are about a score of other American manufacturers who have, or had, agents in France, but the condition of their stores at present is not a credit to the home factories. All these stores are closed and only the name serves to show where American cars were once sold. Packard keeps open house and is going to unveil the twin-six to Parisians during the present month.

One of the best French dealers, who has financial backing from a millionaire manufacturer, had completed nearly all arrangements for marketing a cheap American car, and had purchased sample cars when news of the proposed duty leaked out. Immediately the backer withdrew all support and the scheme has been dropped. All dealers are now sitting tight awaiting the government move. It may be possible to do some business under a 33 per cent duty, but admittedly the situation will be difficult and only the best propositions handled by the most experienced agents can succeed.

—

12 Cars Imported in Sept.

WASHINGTON, D. C., Nov. 30—Twelve cars, valued at $17,198 were imported into the United States in September, 1915. During the nine months ending September, 1915, a total of 171 automobiles, valued at $265,936 were imported. During September, 1914, the imports amounted to sixty-two automobiles valued at $95,170 and during the nine months ending September, 1914, 388 automobiles valued at $293,610 were imported. The table appears herewith.

—

Murden Leaves Knickerbocker Truck

NEW YORK CITY, Nov. 26—H. H. Murden general manager and engineer of the Knickerbocker Motor Truck Mfg. Co., this city, has resigned, effective Dec. 31.

Indianapolis Race 300 Miles

To Cut Purse to $30,000—Entrance Fee To Be $100

INDIANAPOLIS, IND., Nov. 27—At a meeting of the board of directors of the Indianapolis motor speedway, held this week, it was decided to reduce the distance of the May 30 race from 500 to 300 miles and to cut the purse from $50,000 to $30,000, the prize money to be divided in ten parts. The entrance fee will be $100, which will be refunded to the entrant if his car starts. The 1916 race will start at 1:30 p. m.

—

Saurer Truck Climbs Mt. Wilson

MOUNT WILSON OBSERVATORY, CAL., Nov. 14—The Mount Wilson toll road, which climbs to 6000 ft. elevation in 9 miles, has been conquered by a Saurer truck, weighing 7300 lb., and built to carry a 6½-ton load, carrying a load of 22,235 lb. from the freight yards of the Carnegie Institute in Pasadena to the summit of Mount Wilson, where the new solar observatory is being constructed.

The 11-ton load consisted of a steel casting which will be used as a section of the pedestal on which a 100-in. telescope of the new observatory will rest.

The weight on the wheels of the truck represented approximately 15 tons. In the yard of the Carnegie Institute at Pasadena the wheels sank 3 in. into the roadway. It required 6 hr. and 20 min. to make the climb from the toll gate at Altadena to the observatory at the summit.

A crowd of a hundred or more spectators witnessed the feat.

—

Seventh Edition of Used Car Market Report Out

CHICAGO, ILL., Nov. 30—The seventh edition of the National Used Car Market Report has just been issued by the Chicago Automobile Trade Association. As is evident must be the case with the progress of the industry, this volume is a little larger than the sixth, due to the addition of the 1916 models of many of the cars. In cases where it has not been possible to get authentic figures on 1916 used cars they are not added.

The gasoline car statistics in the sixth edition ended on page 113; in the seventh edition there is a page more. There also are quite a few additions of later models in the electric classification, causing the complete book to end on page 124 instead of 122.

There have been no additions in the list of cars represented. As in the sixth edition, there are 154 gasoline cars and fourteen electrics listed.

Greater co-operation is, however, being secured from associations of dealers. The sixth edition listed twenty-eight as subscribing to the service. In the seventh edition these are added: Ohio State Automobile Association, Cleveland; Iowa Automobile Business Association, Des Moines; Hartford Automobile Dealers Association, Hartford, Conn.; St. Louis Automobile Mfgs. and Dealers Association, St. Louis; Troy Automobile Dealers Association, Troy, N. Y. This makes a total of thirty-three.

—

White To Exhibit at Salon

NEW YORK CITY, Nov. 26—The Automobile Salon, which will be held at the Hotel Astor Jan. 3 to 8, will have more exhibitors than any of its predecessors. The representation of American cars will be increased from three to ten or more. Among these will be the White, Simplex, F. R. P., Singer, Owen Magnetic, Brewster, Daniels and Baker. The foreign makes will include the Rolls-Royce, Lancia, Delauney-Belleville and Isotta-Fraschini. The body makers already represented are Holbrook, Healey, Brewster and Bender & Robinson.

All space has been taken at the show which will be purely an invitation affair as last year. It has not as yet been decided whether a banquet will be held during the salon.

—

Resta Sails for Europe

NEW YORK CITY, Nov. 26—Dario Resta, hero of the 1915 speedway season, sailed yesterday for England. He will go to France for new parts for his Peugeot. He also plans to buy another car from the Peugeot makers if there is one for sale.

—

Kissel Branch for San Diego

SAN DIEGO, CAL., Nov. 24—The Pacific Kissel branch has announced that a branch will be opened in San Diego within the next few days. The company is now fitting out quarters in the San Diego Hotel building where the Kissel and Briscoe will be handled in this territory.

—

Car-Buyers' Finance Co. Formed

SPOKANE, WASH., Nov. 24—The Washington Motor Car Finance Co., capitalized for 250,000 shares at $1 each, has been organized in Spokane, Wash. The incorporators are Samuel Glasgow, J. M. Watkins, H. T. Irvine, S. A. Mitchell, and others. J. A. McKee and Charles A. Bradley have been named vice-presidents of the corporation, and S. A. Mitchell, secretary.

The purpose of the corporation is to finance the purchase of automobiles, either by dealers or individuals. Money will be loaned on new cars where from 33 1/3 to 50 per cent of the purchase price is paid by the owner. The company will take a mortgage on the vehicle or purchase it outright and lease it to the buyer, to protect itself for the money advanced.

—

Maxwell in Non-Stop Run

LOS ANGELES, CAL., Nov. 23—A stock Maxwell 25 is making an attempt to establish a new world's non-stop record in and around Los Angeles. The car started yesterday and at the end of 36 hr. had covered 797 miles or at an average speed of 22 m.p.h. The car is averaging 26 miles to the gallon of gasoline. The machine is registered with the A. A. A. as a stock model, the sanction number being 888. Earl Cooper, the racing driver is acting as temporary A. A. A. representative in this territory and before leaving for San Francisco yesterday, appointed three official observers who are riding in the car 8 hr. per day. Three employees of the Lord Motor Car Co., Maxwell distributors, are driving.

—

All National Show Space Sold

NEW YORK CITY, Dec. 1—No more space is left for car exhibits at either of the National shows, a condition which has never existed before at so early a date. To date only five accessory spaces can be had and these have been applied for.

—

Knox Tractor Does Well in Cincinnati Haulage Test

CINCINNATI, OHIO, Nov. 26—This city recently held a test of gasoline tractors for municipal hauling, to test among other things just how much tractors could haul, whether several trailers could be handled conveniently, whether the tractor engine was equal to the task of hauling tonnage up an 8 per cent grade and whether the combined weight of several heavily loaded trailers down that grade could be held back. A Knox tractor was chosen for the experiment and six trailers, the ordinary municipal type dumping wagons, were used.

With the trailers loaded with mud weighing 38,550 lb., the tractor hauled the train up a hill 7000 ft. long with a mean grade of 6.2 per cent and a maximum grade of 8.3 per cent. The surface of the street was granite block.

—

Plan Race for Los Angeles

LOS ANGELES, CAL., Nov. 23—Plans are under way for a track race in this city, Dec. 10, in which Barney Oldfield will meet Earl Cooper, and Teddy Tetzlaff is also expected to appear.

Laying Out Chain Camshaft Drives

(*Concluded from page* 1009)

is used for the small wheels, a good gray or piston iron for the large. One set of wheels will wear as long or longer than the chain, and generally the chain is the only part to be replaced. The record mileage, as far as our product goes, with no adjustment, is 32,200 car miles, and I confidently predict a car mileage in the hands of the public, with adjustment for the chain, of from 50,000 to 100,000 car miles, and during this mileage there will be that softer, less harsh feeling than with gearing, and no objectionable noise. Permit me to say that I am here referring to commercial gearing, not special hand fitted, where the cost of the gear drive is probably far in excess of a chain drive, and cannot be produced in the large quantities as commonly manufactured in this country.

Is Chain Makers' Problem

In laying out chain drives for use on the engine, I know I will be serving the manufacturers and users of the car best by advising that the problem be turned over to the chain makers as early as possible, when slight modifications may be made that in no way will impose restrictive limitations on the general design, but will sometimes make the difference between a successful and unsuccessful drive. I also feel that such advice will be little heeded, although I am pleased to say that some manufacturers are co-operating in this way with most satisfactory results.

The information that has appeared from time to time in print has in a general way been correct, and a summary of the recommendations of the various chain makers, as well as Mr. Ricker's observations, will be found in the paper before referred to, which was printed in Part I of the 1912 Proceedings of your Society. I have slightly modified some of the statements therein found, not, please understand, because I think I know more than others in this line of business, but because I think I know the action of our product.

To Prevent Whipping

There is one statement that has been made, and from my experience it is generally accepted as true, viz., that with adjustment whipping can be prevented with the resultant lesser wear and a quiet running drive. This, I believe, is an error, and a most serious one. As far as my experience goes, there is no tension within the capacity of the bearings that will prevent a whip if it is present in the drive. It will reduce the amplitude of the whip, but the destructive force will still exist, and under tension it will never give that smooth running feeling that is always present in a properly designed chain drive. The destructive whip, which occurs when the rate of chain vibration synchronizes with some impulse given off by the engine, must be overcome by changing the critical rate of vibration of the chain, and this is the problem that should be solved when designing, if chain driving is going to be the success warranted by its peculiarly favorable characteristics for this type of drive.

Rules for Design

It is most difficult to give specific instructions for a proper design, and I am not sure that a design for the Morse chain, for instance, will be correct for the other makes, but in general we advise (1) the triangular drive as cheaper and taking less room; (2) shortest centers possible between crank and camshaft; (3) drive from crankshaft to camshaft, and then to accessory shaft, not to camshaft through the accessory shaft; (4) chain wrap should be not less than five teeth; (5) provide adjustment, generally easiest on the accessory shaft; (6) use an odd number of links in the chain, and an odd number of teeth in the crankshaft and accessory sprocket when possible; (7) provide an oil lead from the general oiling system leading to the inside of the chain; (8) design the chain case so that the chain can be made endless, and when on the wheels can be put in place; (9) if adjustment is provided without taking off the gearcase, provide a convenient means of feeling the chain to adjust to the right tension.

Generator Drives

I have made no specific reference to the starter-generator application, as this is an entirely different drive from the cam and accessory shafts, and requires different treatment. The centers almost of necessity are such as to bring the chain within the danger zone of vibration, and so far no weight of chain throughout the full range of elasticity that we have been able to provide has produced what we consider a satisfactory drive. Many of the cars equipped with chains are very noisy at some critical speed, when the strain upon the chain is far in excess of that under which it can be safely run. To correct this trouble necessitates, we believe, the use of a flexible or slipping sprocket wheel, and we have developed such a wheel, which gives a fair promise of success. In the very nature of the case, however, the critical speed or tendency to whip being so markedly different with different engines, we are not entirely satisfied that the device on which we are experimenting will meet all of the conditions, but it has characteristics which permit of a wide range of application, and we are hopeful that it can be made so as to give a quiet and durable drive for this class of work.

Discussion Is Good

IN commenting on his paper, Mr. Morse said that there is a certain point of adjustment in every motor car engine for the tension of the silent chain layouts at which they run the quietest.

Howard Marmon asked how much trouble Mr. Morse is experiencing in getting the co-operation of the car makers in the laying out of chain drives.

Mr. Morse replied that it has not been easy to get any of the automobile engineers to co-operate early enough in the design to permit him to select the center distances he would like, but wherever the engineers have done so, a drive has been furnished that is free of vibration throughout the whole range of engine speed. In his first experience with automobile work, he could get nothing from the engineer of the company that was taking the chain. He considered a chain drive the same as a belt, and thought a belt could be put on to drive anything, notwithstanding some experiments of the Brown & Sharpe Co. that prove there is no period in a belt. This engineer thought the chain simply a makeshift for a belt—merely a belt taking two centers. He took out the gears and put on the chain. Almost always when this was done they got into trouble with the critical center distances. In such cases all kinds of vibrations were set up, and it was necessary to either change the elasticity of the chain by cutting the arc higher, or not so high, or to change the weight or tension of the chain. Such working was decidedly at a disadvantage, because the problem in each case is different and the rate of vibration and period are local to each installation.

Mr. Morse said that he would like to have standard chains that would fit any installation, but the contrary has been true. Chains that seem to be the same to the engineer are radically different in their elasticity. So far as the Morse chain is concerned, they are oftentimes also different in weight and critical speed.

Mr. Morse believes that the solution of the silent chain drive for automobiles has been found, for with the experience the chain makers now have, after going through all sorts of troubles, it seems to him that while sometimes an engine

is built for which the chain makers cannot lay out a drive, if the automobile engineer will permit any chain maker to lay out the drive as he (the chain man) would like to have it, within the chain limitations he knows exist, Mr. Morse believes the chain man can furnish a drive that will be most satisfactory.

Asked as regards chain drives for fours as compared with engines of more cylinders, Mr. Morse said that it is very difficult to make a satisfactory chain drive for a four-cylinder engine. It has to be handled with gloves, and in the Morse chain, for instance, he said there is a maximum range of adjustment of only ⅜ in., without getting into trouble. In the old fours, the crankshafts were often found wanting. The impulses set up by the explosions would produce a vibration which was substantially due to a twisting of the crankshaft a good many degrees when the forward cylinder exploded. When the rear cylinder fired, there was a practically true angular velocity between the cranks, but when the first cylinder fired there was a spring in the shaft which almost always set up a vibration in the chain.

Adjustment Essential

In a chain drive, Mr. Morse explained, it is almost essential that some means of adjustment be provided. You can either move the shaft, or adjust by an idler against the chain, providing that idler is doing work. Mr. Morse does not think you can satisfactorily put an idler against the outside or the inside of a chain unless it does work, for the reason that the chain must run loose. While the chain in the diagram is shown in the conventional way by straight lines between the two wheels, it should at least sag ⅜ to ½ in. on the slack side when it is running, and for that reason no support would be desirable unless it be simply a means of shortening the distance the slack side would be dropped, bringing a node point.

There is a vibration wave that passes through the wheels and comes out on the slack side, but it originates on the tight side. In running, a chain must throw out at a tangent from the wheel, and if it does not when running, it will be noisy, and under no conditions will it operate satisfactorily. If you try to hold it in close to the wheel, it will take a path different from that which it wishes to follow, and it becomes noisy immediately.

Speaking of vertical drives, Mr. Morse said that he would not recommend a vertical chain drive without an adjustment. One prominent car manufacturer is using it without adjustment, therefore Mr. Morse explained that he has no right to say it is absolutely necessary, but he thinks this manufacturer could get a longer mileage out of the chain by using an adjustment, although whether the expense of putting one in would be warranted he leaves to the manufacturer to decide.

W. G. Wall asked as to the amount of wear on the sprockets as compared with the chain, and also if anything has been devised in the way of a balance or indicating device that will indicate to the assembler when putting the chain on that the tension is right.

Wear All on Chain

Mr. Morse said that the wear seems to be almost entirely on the chains, this being especially true of the crankshaft sprocket. He has seen one, he said, after a chain had run 72,000 car miles, and the sprocket was only polished nicely. The camshaft sprocket was also good for many more miles without change. There was probably 1/64 in. wear on the sprocket above referred to, and that was the longest mileage he has had an opportunity to observe.

However, Mr. Morse pointed out, if something goes wrong—if the manufacturer fails in making the chain correctly, or gets in the wrong kind of a link or gets it in backward, as will sometimes happen—the defective point will be a source of steady grinding and will take off every tooth on the sprocket. But under normal conditions, Mr. Morse claimed, there is nothing in the life of the ordinary automobile that will compare with the wear that an ordinary chain transmission will undergo. Tests have been made for over 3000 hr. at a speed of 1700 r.p.m., which would represent hundreds of thousands of car miles, and there is practically no wear shown on the sprockets.

The Proper Tension

In regard to the tension in the chain when assembling, Mr. Morse said that he has tried to get close to the engineers on this, and has recommended putting the chain on with a finger lift of ¼ in. each side of the center. However, this brings in the human element so strongly, and the definition of finger lift is so varied that he says some surer method must be devised, such as using a spring pressure of predetermined amount lifting the chain a certain distance.

Howard Marmon asked whether it is necessary to make provision in the chain housing to allow for breakage.

Mr. Morse said that his company has broken a number of chains to find this out, and they found no damage ever followed so long as the distance from the top of the teeth to the housing is greater than the depth of the chain. The chains have a limited angular motion, and so long as they cannot bend square around, they tend to pile up. If it breaks it will probably be on the tight side, and the sprocket would keep running and the chain pile up in the lowest point of the housing. Mr. Morse suggests a clearance between drive and housing of slightly more than the depth of the chain around the wheels. The housing should allow 1½ in. beyond the chain on the slack side.

Chester Ricker asked if the driving of a camshaft, due to the somewhat intermittent load, tended to periodicity in the chain, and also what the difference was in eights or twelves.

Mr. Morse gave the opinion that it is immaterial whether we drive a camshaft or other device that has fairly uniform resistance, there will always be a vibration set up in a gas engine. He added that with an increasing number of cylinders there is less liability to chain whip, but the chain designer has always to take into consideration that the twelve is a twelve only part of the time. It will miss and skip, and do other things which make it necessary to lay out the drive for bad working conditions as well as good. It must be laid out so that no unexpected condition will set up a critical vibration that will break the chain or destroy the wheels. That periodicity must be avoided if a cylinder is missing continuously. If two are missing, you get poor compression on two cylinders. An indication of whipping is secured on almost any chain drive but a point must be attained where that whip is not destructive. Mr. Morse cited a case where he had installed a 60-hp. drive, but it took 90 hp. to drive it. He later shortened the centers from 41½ to 39½ in. and that slight change remedied the whipping that had consumed 30 hp. and made the chain run noisily.

The point was raised by Mr. Bull that, in his experience, the use of chains tended to increase the volumetric efficiency of an engine, due to the removal of chatter and the flexibility of valve opening and closure.

Mr. Morse said that he confessed to the fact that the opening of the valves when driven by a chain is retarded materially, and accelerated in closing on account of the elasticity and backlash of the chain as compared with gearing. If a high efficiency has been obtained by the use of chains, he thought it due to the fact that the valves open slower and not to other causes named.

He also thought chains will remove valve chatter, and though a gear is more positive in its driving than a chain ever is, for whenever any change of stress comes on the chain, through the fact that the chain is driven by frictional contact with the wheels, there is still a material retardation.

He therefore thought if better results have been obtained by the use of chains, it is one of those happy circumstances that is not due to any inherent characteristic or steadier angular velocity.

Factory Miscellany

Wheel Co. Adds—The Auto Wheel Co., Lansing, Mich., is constructing an addition to its hub house, costing $20,000.

Specialties Co. to Add—The Motor Specialties Co., Muskegon, Mich., has contracted to build two additions which will cost about $6,000.

Hurlburt Truck in New Plant—The Hurlburt Motor Truck Co., New York City, has moved into its new plant at Third Avenue and the Harlem River.

Newark Co. to Build Bodies—The G. S. Jephsen Co., Newark, N. J., will establish a plant on Central Avenue, for the manufacture of automobile bodies.

Brown Carriage Co. to Build—The Brown Carriage and Auto Co., Cleveland, Ohio, has awarded the contract for the construction of a plant, the estimated cost of which is $10,000.

Republic Truck Adding—A one-story addition is being added to the plant of the Republic Motor Truck Co., Alma, Mich., and will add about 50,000 sq. ft. of floor-space to the plant.

To Make Automobile Specialties—The Autocoil Co., Jersey City, N. J., will establish a factory at Provost and Seventh Streets, Jersey City, N. J., for the manufacture of automobile specialties.

Cleveland Co. to Add—The Hydraulic Pressed Steel Co., maker of automobile frames and pressed steel stampings, will construct additions to its factory at 3152 East Sixty-first Street, Cleveland, Ohio, the estimated cost being $50,000.

Ford to Build in Grand Rapids—A committee representing the Association of Commerce of Grand Rapids, has been appointed to visit the Ford Motor Co., Detroit, in view of the proposed erection of a Ford assembling plant in Grand Rapids.

To Make Windshield Cloth—The Central Agency Co., Kansas City, Mo., has purchased the exclusive right to manufacture and sell a compound called Windshield Cloth, which when applied to a windshield absorbs moisture and prevents rain, snow, sleet or mist from sticking to the glass.

Housel & Bair Adds—The firm of Housel & Bair of Williamsport, engaged in the manufacture of automobile clutches, took out a permit this week for the erection of a factory near its present quarters on First Street. The building will be a one-story brick structure and will cost approximately $5,000. The company has enough orders to keep it busy for a year and a half.

Milwaukee Co. Makes Parts—The Wisconsin Machinery & Manufacturing Co., Fifty-first Avenue and Burnham Street, Milwaukee, is devoting most of its shop capacity at this time to the manufacture of parts and devices for the motor and automobile building industries. The concern is making a specialty of pistons. Machine work is also being done on large quantities of aluminum, cast iron and steel parts of various kinds.

Luther Grinder Co. Busy—The Luther Grinder Mfg. Co., 285 South Water Street, Milwaukee, is making large shipments of tool grinders and similar specialties for export to South Africa, India and South America. The domestic demand is the best the company has ever experienced, and the six-story factory is working night and day. The combination garage grinder is being produced in large quantities to meet the demand from jobbers.

Dodge Has 100 Carloads of Freight Daily—An average of 100 carloads of freight forms the daily incoming freight now at the Dodge Bros., Detroit, Mich., plant. This freight includes generally 400 tons of coal for the steam boilers, 15,000 gal. of fuel oil for the heat treating plants, 225,000 lb. of steel for parts, 30,000 lb. of brass for the brass foundry, 10,000 lb. of aluminum for the aluminum foundry, 55 tons of pig iron for the gray iron foundry and 6 tons of sand for the foundries.

The Week in the Industry

Bunnell Paige Rep.—Marc Bunnell, formerly with the Chalmers company, has assumed the duties of Southern Cal. factory representative of the Paige-Detroit Motor Car Co.

—

Dealers

Studebaker Opens in Bronx—Reed & Reed, Inc., have taken the Studebaker agency for Bronx County, New York, and have moved into a showroom at 361 East 149th Street. The building measures 30 by 90 ft. A service station has also been opened.

Foster Opens Denver Supply House—The Foster Auto Supply Co. is the name under which a new accessory business will be opened in December at 138 Sixteenth Street, Denver, by J. W. Foster, formerly manager of the Denver Auto Goods Co.

To Distribute Spranger Wheel—The P. M. Lewis Co., with headquarters at 423 Grand River Avenue, Detroit, has been organized and has been appointed distributor for the Spranger Rim & Wheel Co. The members of the company are P. M. Lewis, E. A. Tomes, F. V. Haddas and George Gagnier.

Late Baltimore Trade Items—W. A. Marburg of A, 32 South Street, Baltimore, Md., has taken the agency of the Fox shock absorber for Maryland and the northern part of Virginia.

The Baltimore Buggy Top Co., 107 to 113 West Mount Royal Avenue, Baltimore, which handles automobile supplies and does automobile repairing, will build a 76 by 124 by 49 ft. addition to its present plant. It will be a one-story structure of brick.

The Service Co., Bank and Fifth Streets, Highlandtown, Md., distributor of Goodyear truck tires, has moved to 1209 Lovegrove alley, Baltimore.

H. C. Clark and Frank Hodinott, who comprise the Motorcar Accessory Co., 1201 North Charles Street, Baltimore, has taken the agency for a safeguard valve device for automobiles turned out by the Fire Prevention Co., Providence, R. I.

The Tire Mart, 1419 North Charles Street, Baltimore, of which F. M. Boyd is manager, has been appointed State distributor of the Jovo tire seal.

The Gilson Sales Co., Cathedral Street, near Chase Street, Baltimore, is now the distributor of Kor Ker, the new puncture cure manufactured by the Alcemo Co., Newark, N. J.

Motor Men in New Roles

Hurst Makes Change—C. F. Hurst, who has been district representative for Dodge Bros., with headquarters at Omaha, is now with the King Motor Car Co. in the same position and territory.

Cooke Joins National Rubber—E. W. Cooke, until recently sales manager of the American Tire and Rubber Co., Akron, Ohio, has joined the National Rubber Co., Pottstown, Pa., as assistant sales manager.

Carter Resigns—L. J. Carter, until recently in charge of retail sales for the Studebaker company in Saginaw, Mich., has resigned to become sales manager for the Peck Auto Sales Co., Studebaker dealer in Grand Rapids, Mich.

Baird Joins N. Y. Saxon—F. S. Baird has become retail sales manager of the Saxon Motor Co. of New York. He was formerly with the Chevrolet Motor Co. in the sales department. H. C. Turner has also joined the New York branch, coming from the Saxon factory.

Case Goes to Scripps-Booth—Julian C. Case, until recently assistant advertising manager of the Paige-Detroit Motor Car Co., Detroit, Mich., has resigned to become assistant advertising manager of the Scripps-Booth Co., manufacturer of the Scripps-Booth automobiles.

Cartmell Kelly-Springfield Tire Mgr.—R. P. Cartmell, Los Angeles, Cal., has been appointed manager of the Southern California branch of the Kelly-Springfield Tire Co., to succeed C. A. Jessup, who goes to Cleveland to become manager of the Kelly-Springfield branch there, which controls Buffalo, Indianapolis, Columbus and Toronto.

Franklin Detroit King Mgr.—As a result of a meeting of the directors and stockholders of the A. A. Crumley Co., Detroit, the name of the concern is to be changed to the King-Dort Sales Co. A. A. Crumley, president and general manager of the A. A. Crumley Co. is not connected with the new company. G. W. Franklin, who was sales manager of the Crumley company, becomes general manager of the new company.

Cochran Frisco Cole Mgr.—W. B. Cochran has re-entered the automobile field and will distribute the Cole through northern California. The new company is headed by A. B. Emanuel, while Mr. Cochran is vice-president and general manager. The firm will be known as the Cole-Pacific Motor Co. and has headquarters in San Francisco, which formerly were occupied by the Rauch & Lang dealer.

—

Dealer

Minneapolis Companies Build—The Pence Automobile Co., Minneapolis, Minn., will erect a new building for the Buick car extending on Tenth Street from Hennepin to Hawthorn Avenue and to cost $250,000. The present eight-story Pence-Buick building will be leased for a department store. The new building will be 308 ft. long and four stories. It will be an accessory store center in space not occupied by the owner company.

The Willard Storage Battery Co., Plymouth building, has arranged to erect a two-story building, 60 by 150 ft., to be ready in 3 months. It will be headquarters for N. G. Wolf, managing the Dokotas, Montana, Minnesota and Northwestern Canada. H. S. Greiner will be local manager. Temporary quarters were opened Nov. 20 at 1301 Nicollet Avenue.

The Northwest Automobile Co. has been formed to wholesale Hupmobile cars in Minnesota, North Dakota, Eastern Montana and Western Wisconsin, S. D. Briggs, formerly with the Pence Automobile Co., is manager. Headquarters are at 620 Third Street S. The local agency for the Hupmobile is the Zolle Co., 220 Sixth Street S., which has given up the Pathfinder agency to the John P. Snyder Co., 407 Tenth Street S.

Recent Philadelphia Trade Items—The Stoever-Hannold Co., Philadelphia, Pa., distributer of the Jackson, has removed from 833 North Broad Street to larger quarters at 923 North Broad Street.

The Prest-O-Lite Co. has opened a service station for the charging and repairing of storage batteries at its local branch, 1418 Race Street.

The agency for the National car, in the Metropolitan Building, Philadelphia, has come into new ownership, Raymond Hawley of Riverton, N. J., taking complete charge. Associated with Mr. Hawley will be W. L. Conner, who will assume charge of the sales and service departments. The agency will cover this State, New Jersey and Delaware.

A complete stock of automobile accessories has been added to the sporting goods business of Moskowitz & Herbach, 430 Market Street, Philadelphia.

VOL. XXXIII NEW YORK—THURSDAY, DECEMBER 9, 1915—CHICAGO NO. 24

The AUTOMOBILE

Ignition Systems Improved in Detail

More Cylinders and Higher Speeds Require Faster Breaker Mechanisms and Coils—Better Mounting and Neater Switches This Year

By J. Edward Schipper

WITH the standard of efficiency year by year reaching a higher mark in motor design, it is but natural that the motor auxiliaries are also compelled to advance in order to give a harmonious record of progress. Scanning the field of accessories there is none in which the demand for the highest grade of results has been so keenly felt as that of ignition. Better motors are only possible with better ignition. Higher motor speeds can only be attained with faster action in the sparking device. More cylinders coupled with higher rotative speeds are interpreted to the ignition manufacturer in terms of more sparks to the minute, and this is the keynote of progress in the ignition field during the past year.

Up to 3000 r.p.m.

It is a different proposition to supply the ignition for a four-cylinder motor turning at the rate of 1200 r.p.m. and a twelve-cylinder motor turning at 3000 r.p.m. The difference is that in the first instance, 2400 sparks are required per minute, while in the latter, 18,000 sparks are needed in a minute. It is just as essential for every one of the 18,000 to be a good substantial hot flame as it is for the individual sparks in the smaller number. Between these two extreme conditions is the field of the up-to-date ignition system, but, requirements are closer to the upper than to the lower limit.

In a word, progress in the ignition field can be summed up in the statement that sparking systems can operate more rapidly than ever before. Secondly, the sparks furnished are more intense and hotter throughout the upper and lower ranges of speed. Synchronism, that quality which causes the spark to occur always at the same relative part of the stroke, at all speeds is now possessed by ignition systems to a greater extent than ever before. The use of automatic advance is another growing tendency and leaving the electrical and entering the mechanical phase of development, the systems of to-day are more compact accessible, and ingeniously mounted than formerly.

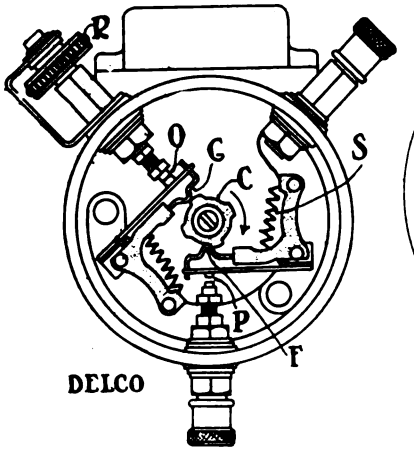
Progress

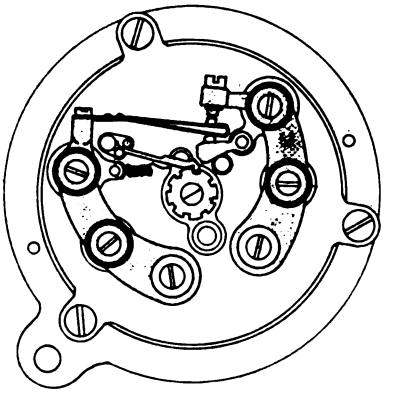
Faster Breaker Mechanism
More Rapid Coil Action
Better Timer Mounting
Ignition Adapted to 12's
Perfected Synchronism
Short High Tension Leads
Neater Dash Switches
Automatic Advance Featured
Improved Contact Points
Water-Proof Coverings

Inertia is the great foe to speed in mechanical appliances. It has to be overcome particularly in the breaker mechanism of a high-tension ignition system. Upon the rapidity of separation of the breaker points of the primary circuit, depends the heat of the spark. It is for this reason that the attention of ignition manufacturers has been very carefully concentrated upon improvements in the breaker mechanism ever since the high-speed motor began to be a factor. This year has been no exception, and the ingenious manner in which the ignition makers have met the demands for eight and twelve cylinder motors is one of the features.

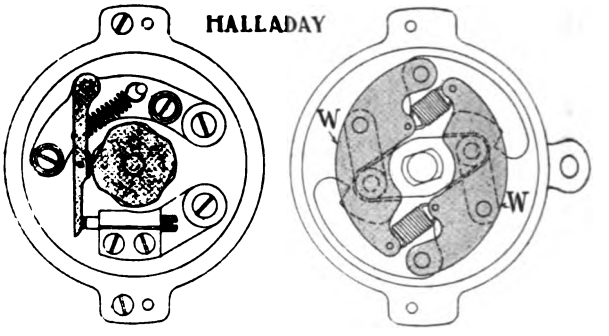
Double Breakers for Twelves

As a general feature it may be stated that the breaker box mechanism has not been altered in principle but rather in the mechanical application where the multi-cylinder V-type engine has been taken care of. Many manufacturers have used the same system but have installed a double breaker acting alternately when twelve cylinder demands have had to be met. In such designs, the breaker box merely consists of a double set of single breakers operating from the same cam but so arranged that the proper timing synchronism is maintained.





Breaker mechanisms of the Delco and Atwater Kent systems



Halladay MacNish 1916 breaker mechanism showing the method of separating the contact points in breaking the primary circuit and the weights W which actuate the automatic advance by centrifugal force

In the breaker mechanism for battery ignition there are two broad classifications based upon the method of operation. These two systems can be classified as the open circuit and the closed circuit. The open circuit keeps the primary broken until, at the time of firing, a brief make and break occurs. With the closed circuit the primary is complete except at the instant of firing when the circuit is broken and then immediately remade. The open circuit advocates claim the advantage of economy as the primary is closed for only a short period. The closed circuit advocates claim the advantage of perfect synchronism, due to the elimination of electrical and mechanical lag and a hot spark due to complete saturation of the primary.

Two Battery Systems

This broad classification of the breaker mechanisms divides into two groups all the battery ignition systems which are on the market. With both of these types of systems, it is necessary to provide some means for preventing the current from circulating through the primary should the switch be left in the on position inadvertently when the motor is not running. This necessity gives rise to ingenious contact breaking arrangements and is another feature by which the different makes can be distinguished. The three most popular methods of preventing the short circuiting of the accumulator in battery systems are the automatic throw-off switch, the latch release systems and the automatic resistance coil, which are used by the representative concerns in this field.

These three methods which will be described later are typical of the classes of systems to which they are applied. The throw-off switch which is operated by a thermostat is used on the closed circuit design while the latch release and resistance coil are parts of the action of the open circuit breaker mechanism.

Regarding synchronism the open and closed circuit arrangements also cause a difference in the principles by which this quality is obtained. The elimination of lag in the closed circuit method gives the desired constancy in spark timing while with the open circuit it is attained by representative manufacturers through the means of automatic spark advance which is designed always to keep the spark in its proper relationship to the position of the piston regardless of variation of the motor speeds. The lightening of breaker parts is also a factor in attaining synchronism as the relative lag with heavier parts would be greater at higher speeds than at low speeds.

Advantage to Driver Claimed

With reference to automatic advance there are practically no battery ignition manufacturers who do not believe that its use is an advantage to the driver. Many applications on 1916 cars use both hand and automatic, the automatic fully taking care of the speed variations while the hand advance can be used for further adjusting the spark if the driver believes it necessary. It is the contention of most ignition experts that automatic advance can regulate the spark to better advantage than the average driver. There have been tests made on this and the theory has been borne out. In fact, even with fixed spark on magnetos the hotter spark at higher speed has often more than compensated for the lack of advance and produced results which are at least equivalent to those obtained by the average driver with manual advance.

As regards the actual installation of ignition systems on cars, some very clever work has been done this year. In the V-motors particularly, it has been necessary to give an accessible mounting with efficient drive and at the same time keep the leads from the distributor to the spark plug as short as possible. With the high-tension current, even a small percentage of leak can seriously cut into the heat value of the spark and thereby impair the rapidity of explosion and reduce the initial pressure which, of course, should be kept at a maximum. The resistance interposed in the high-tension circuit also increases with the length of high-tension lead and there is therefore a two-fold reason for keeping the distributer as close to the plugs as possible. For this reason the timer-distributer unit has been generally mounted between the V blocks on eight and twelve-cylinder motors. Another typical installation is at the front end of the V just behind the fan. With four and six-cylinder motors the coupling of the distributer unit with the generator, giving an approach to magneto compactness, has been one of the developments of the year.

The magneto for eight and twelve-cylinder cars is an ignition feat which has taxed the ingenuity of the electrical engineer to the utmost. The demand has been sucessfully met, however, and even with the high speeds and rapid spark demands of this type of power plant the magneto has been found to be adaptable.

Atwater Kent Adapted to V's

Probably the most important development this year in the Atwater Kent system is the production for V-type motors of the standard system with a few detailed changes to render possible the greater number of primary breaks. The eight-cylinder instrument is so arranged that the automatic advance mechanism advances only the notched camshaft of the instrument, the high-tension distributer being carried on a central shaft which connects below the governor so that the distributer block is not moved by the automatic advance mechanism. This permits of a wide range of spark advance without affecting the synchronism.

The change in the arrangement of the advance mechanism is the most important on this device as with the eight-cylinder unit a single pair of contact points and a single distributer are employed. For the twelve-cylinder unit a double breaker mechanism is fitted, but on the eight it has been found that the critical speed of the instrument is in excess of the motor speeds yet attained.

Owing to the necessity for cutting eight notches on a single timer shaft it has been found necessary to alter the shape of the notch so as to secure equal

spacing around the shaft without cutting away too much material.

It has also been necessary to alter the shape of the lifter which is operated by the notches in the shaft to meet the requirements of the new shape of notch and these two forms of notch and lifter are shown in the accompanying illustration.

Time Element, .0033 Sec.

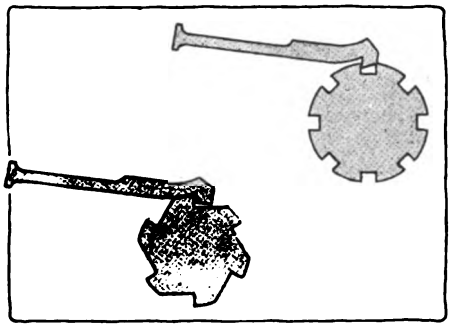
Regarding the necessity for meeting the speed requirements of the latest developments in motors of a great number of r.p.m., it has not been found necessary to make any alterations. Although working on the closed circuit ignition system which is necessarily limited in critical speed, if not by the time element in the contact maker by that in the coil, the method employed has been found suitable for use above the speeds which are now used in power plants. The time element in the Atwater Kent system is about 0.0033 seconds for the duration of the primary contact. Oscillograph curves show this clearly as illustrated. To operate at this speed requires a very rapid coil and the curve itself indicates that such is the case.

No changes of any sort have been made during the year on the standard four and six-cylinder ignition systems which have been frequently described. The only differences between the eight and twelve, and the four and six are those which have been outlined above.

The present limit to which the standard centrifugal automatic advance mechanism operates in the Atwater Kent system is 2400 r.p.m. Above this speed the supplementary hand control is used and this two-fold control has been adopted because in the belief of the Atwater Kent concern the big value of the automatic advance is chiefly in the matter of rapid acceleration and at low speeds.

With the automatic advance device the maximum advance is 45 deg. at 2400 r.p.m. in terms of crankshaft travel.

Regarding the speed under which the ignition system will operate satisfactorily, it is stated by the Atwater Kent company that its six-cylinder system will fire with undiminished efficiency up to speeds exceeding 4000 r.p.m. Tests on the maximum speeds of the eight are not as yet available. The automatic advance will take care of the earlier range in attaining the high speed and the hand advance of the upper ranges.



Illustrating difference between six and eight-cylinder breaker mechanism parts in Atwater Kent system

Advantages of Automatic Advance

Regarding the advantages of automatic spark advance the claims made for it are as follows:

1—Automatic spark advance compensates for the time element or lag and therefore, in the open circuit system compensates for the period of time elapsing in making and breaking the primary contact and generating the high-tension spark.
2.—Smooth acceleration due to the regular advance of the spark in proportion to the increasing speed.
3—Better fuel economy.
4—Less nervous strain on driver.
5—Renders car more easily handled in traffic.
6—Eliminates a point which the new driver must learn in handling his car.
7—Avoids the wear and tear due to spark knock.
8—Insures safe starting due to the retarded position of the spark.

Waterproofing the timer-distributer has been regarded as important by all the manufacturers. In the Atwater Kent system the condition has been obtained by allowing the insulated secondary terminal to come well up over the secondary wire and the distributer cap is so shaped as to shed water readily. As the position of the distributer is generally quite high, the dangers of flooding this part of the mechanism are practically nil.

At the present time, the Atwater Kent ignition system is made in three models, type K-2 with automatic spark advance made in two, four, six, eight and twelve-cylinder sizes; type H, for manual control only, made for twos and fours; type C, for single and two-cylinder opposed motors. In addition there is a special outfit for Ford cars which is complete with fitting, and for other cars, previously fitted with high-tension magnetos, a standard magneto replacement mounting is provided. This magneto mounting is made with the shaft projecting at both ends so that it will take the place of both clockwise and counter-clockwise magnetos.

All these systems are designed for 6 and 12-volt standards. The majority of the outfits turned out are for 6-volt batteries, but either may be secured.

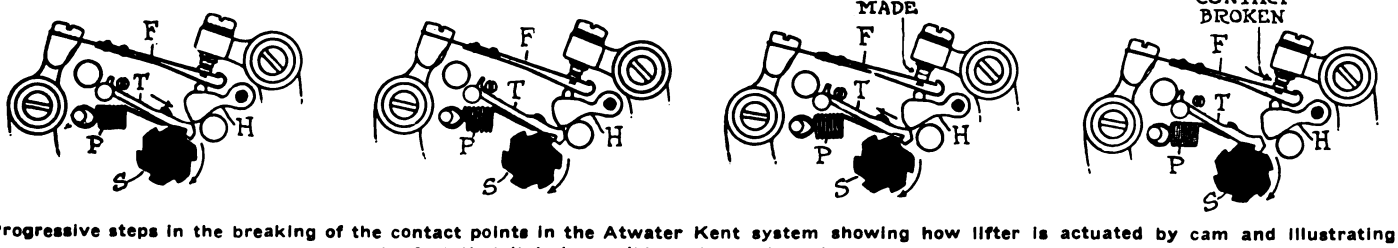
Centrifugal Governor

The current consumption of the Atwater Kent system is very low. It is stated, in fact, that the battery may be exhausted to the point where it will not start the motor, or even blow the horn, yet there will be ample current for several hundred miles of ignition service.

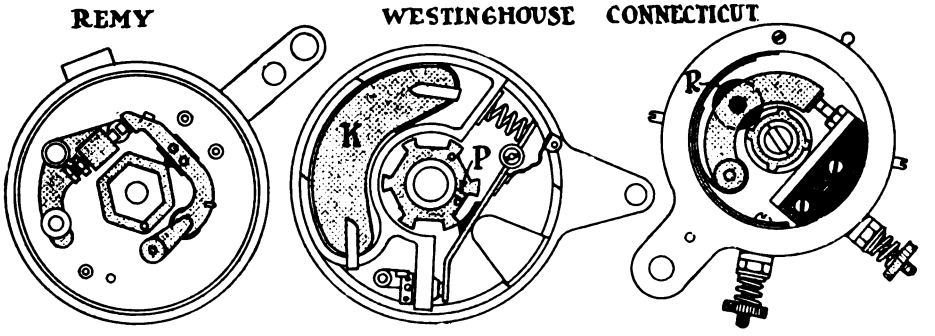
The Atwater Kent system comprises a coil, a combined breaker-distributer mechanism and a control switch. In the breaker-distributer mechanism on the K-2 model is incorporated the centrifugal governor. With this system, a single spark is delivered at the plug and the mechanism is such that the duration of current flow to the primary winding of the coil remains constant regardless of engine speed.

The circuit breaker normally has its contact breakers held apart and the closing and opening of the circuit is so rapid that it is impossible for the eye to follow the movement of the breaker points. Referring to the acompanying illustration, the shaft *S* which is the rotating portion of the breaker-distributing mechanism has four, six or eight notches in accordance with the number of cylinders. The lifter *T* catches in these notches and is drawn around with the shaft a minute distance. When it escapes from the notch, it rides up slightly on the round surface of the shaft and jumps back to its normal position by the tension of the coil spring *P*. As the lifter *T* jumps back it strikes the hammer *H*, which in turn transmits the blow to the flat spring *F*, bringing the contact points together for a minute period of time. This gives the contact and breaks it in such a short space of time that the eye cannot follow the closing of the circuit.

All of the parts which are subject to contact are made of hardened steel, the contact points themselves being made of tungsten, and one of the features of the system is that these points are protected by the switch which reverses the direction of the current flow every time it is turned on. The adjustment of the con-



Progressive steps in the breaking of the contact points in the Atwater Kent system showing how lifter is actuated by cam and illustrating the fact that it is impossible to leave the primary circuit closed



Remy, Westinghouse and Connecticut primary circuit breakers which are fast enough for the highest commercial speeds

tact points is made by the removal of shims from beneath the head of the adjusting screw which carries one of the points. It is impossible for the points to remain together and therefore impossible for the battery to be exhausted should the switch be left in the on position.

Connecticut Uses Closed Circuit

Electrically, the Connecticut battery ignition system operates on entirely different principles than does the Atwater Kent. The Connecticut is the exemplification of the closed circuit system, whereas the Atwater Kent uses the open circuit.

The Connecticut outfit comprises an interrupter and distributer unit, a high-tension coil and a very ingenious switch. All these units are unique and distinctive and represent the embodiment of principles which have been carried to a high degree of perfection to meet the rigid demands of the up-to-date, high-speed motor.

Operating on the closed circuit system, the primary circuit is broken only at the contact points when it is necessary to generate the ignition spark. The advantage claimed for this, is that the primary circuit of the coil is allowed to become completely saturated before the breaking point is reached and therefore, a spark of maximum intensity is produced when the circuit is interrupted.

Another great advantage which is claimed for this system is that both electrical and mechanical lag are eliminated throughout the entire range of motor speed, and the makers state that the eight-cylinder igniter will fire perfectly at a motor speed of 3000 r.p.m. with the single breaker arm. This means that the igniter is producing satisfactorily 12,000 sparks per minute, or 200 sparks every second.

All Lag Eliminated

The reason that the claim is advanced that in this system both electrical and mechanical lag are eliminated is that the instant after the spark has been made by the interruption of the primary circuit the contact is again made and all during the time which elapses between sparks the current from the battery is allowed to flow through the primary of the coil. Since the current is flowing, contact does not have to be made, and therefore there is no possibility of electrical lag. Owing to the velocity of an electrical current this speed is far above the requirements of automobile motors, and for all practical purposes electrical lag in this system does not exist.

Mechanical lag is eliminated for much the same reason, whereas, on the open circuit principle, contact has to be made and broken; on the closed circuit it merely has to be broken, as it has been remade immediately after the previous break.

That the extremely simple action of breaking contact can be performed by means of a cam without noticeable mechanical lag, and is one of the features claimed by the manufacturers of the Connecticut system.

This elimination of lag results in the attainment of almost perfect synchronism. Photographs exposed for 5 min. on a dial representing a complete circle and calibrated to show degrees of crankshaft travel bring out the fact that there is less than a degree variation in the position of the spark anywhere between 100 and 3000 r.p.m. In other words, for any given position of the spark lever, the spark will occur in the same position as regards piston travel at any engine speed.

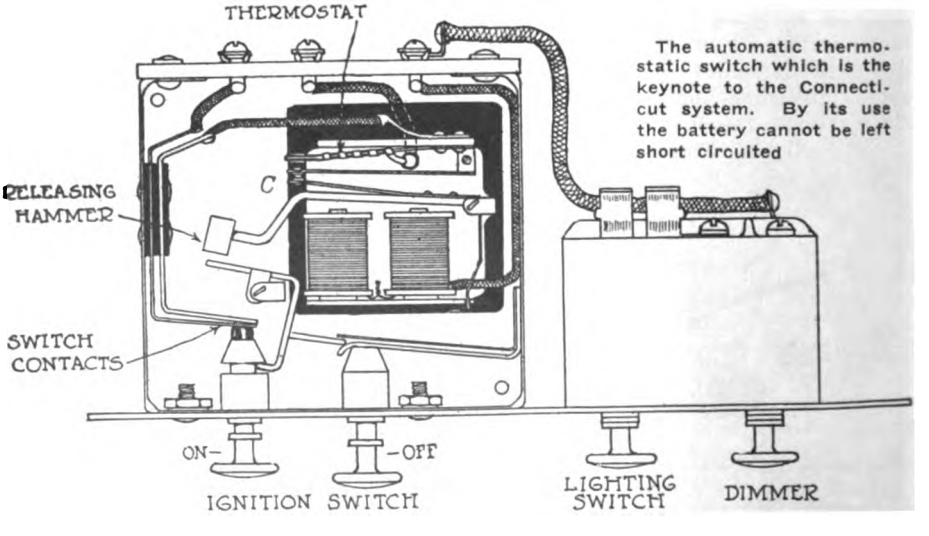
The mechanism of the breaker consists of an arm *A* carrying one contact piece, the stationary block *B* carrying the other contact, an insulated roller *R*, which is carried by the arm *A* and the cam *C*, which is mounted upon the driving shaft in the center. Upon the cam *C* there are as many points or high spots as there are cylinders on the motor. Normally the two contact points are held together by the action of a light spring upon the arm *A*. When one of the high spots corresponding to the firing point in one of the cylinders lifts the roller the circuit is broken and a spark produced. For a four-cylinder motor, the cam high spots are 90 deg. apart; for a six they are 60 deg., and for an eight they are 45 deg.

Has Automatic Switch

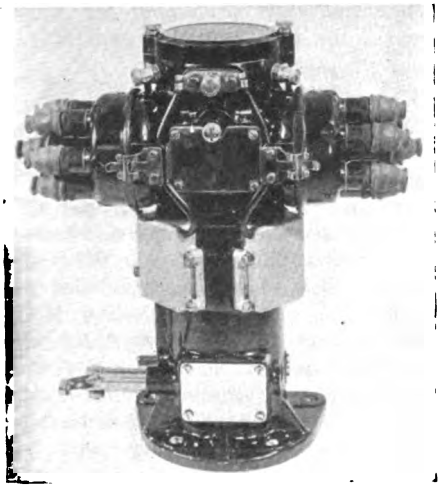
The Connecticut switch is very distinctive in the employment of a thermostatic circuit breaking arrangement which prevents the battery from being exhausted should the driver accidentally leave the switch in the on position when he leaves the car. It is an electro-mechanical device so arranged that the battery switch button is thrown back into the off position if the switch is left on by accident. During the year a lower-priced switch has been brought out which houses the thermostatic device in a square casing instead of the cylindrical one of the older model. The principle, however, is exactly the same.

The method of operation is by utilizing the properties of the thermostat, which becomes warm from the current of the battery and bends downward, making contact with the point. This completes an electric circuit which energizes the magnets in the solenoid coil, causing the arm to operate like a bell hammer or buzzer. This arm drives against a plate, which in turn releases the button in the switch, which is depressed. This breaks the battery circuit and prevents exhaustion.

The distributer unit is of conventional design, but the contact between the distributer rotating member and the distributer points may be either by brush as in a wiping contact or a gap which



The automatic thermostatic switch which is the keynote to the Connecticut system. By its use the battery cannot be left short circuited



Delco breaker mechanism applied to the Packard twin-six

the high tension current jumps may be used. This is optional.

Delco Combined with Generator

Although the Delco installations vary on every car upon which they are furnished, the underlying principles are very much the same. In a great majority of the Delco systems the single unit machine—that is, combined motor-generator for starting and lighting, is used, and with this is provided an igniter unit. In many cases the igniter unit is not included, and in still other installations separate ignition units are furnished either in, or not in, combination with separate motor and generator. This gives a very broad line, and one which of necessity causes slightly different designs to meet the needs of the case.

The Delco breaker mechanism operates on the open circuit system, that is, the primary circuit is broken at the points except during the brief interval in which contact is made at the time the spark is required. The breaker mechanism is operated by a cam on the central shaft, this cam having as many points as there are cylinders on the motor. The spring which holds the contact points apart, during the operation of the motor between sparks, holds the follower against the cam and also acts as the operating unit in separating the points on the break.

With this breaker mechanism it will rarely happen that the motor comes to rest with the follower on one of the points of the cam, but should it do so this would leave the primary circuit complete and would cause current to flow from the battery. Were some means not provided to check this current the battery would be exhausted. The means taken is an automatic resistance unit which is cut into the circuit should the cam follower come to rest upon a point of the cam leaving the primary circuit complete.

The resistance unit is a coil of high resistance wire wound on a porcelain spool and generally mounted on the distributer housing. Under ordinary conditions it remains cool and offers little resistance to the passage of the current. However, if for any reason the primary circuit remains closed for any considerable length of time the current passing through the coil heats the resistance wire to a point where little current can pass, thus insuring against a waste of current from the battery and damage to the ignition coil and timer contacts.

Delco Breaker

Referring to the illustration, the operation of the breaker mechanism is readily understood. As the cam rotates, it lifts at each of the high spots the follower, bringing together the points. After passing the high spot the points are separated by the action of the coil spring. The follower is so arranged that the circuit through the points will be broken when that at the points is complete, thus throwing into circuit the resistance unit when it is needed. In another form of breaker used the resistance unit is directly in connection with the one set of points, and comes into action when the flow through the resistance coil becomes constant instead of intermittent.

The ignition coil on the Delco system is mounted in various positions on different cars, and the switch also varies according to the installation.

Remy Principles Unchanged

The Remy battery systems are the same that this concern has been making for the past three years, although in detail a few changes have been made to meet the changing requirements in motor design. For the eight-cylinder V-type motor a single breaker arm with an eight-pointed cam is employed, and for the twelve-cylinder V-motor a distributer which has two breaker arms is used. Both of the breaker arms on the twelve are positively actuated by the same chrome nickel steel cam, the breaker arms are superimposed so that any looseness in the bearing of the distributer will not affect its synchronism and but one coil is used in connection with the twelve-cylinder distributer.

In order to secure maximum speed in the breaker mechanism the weight of the breaker arm has been decreased by making it of pressed steel, and in order to secure a very fast but smooth break a rebound spring has been added. The pressed steel arm was used in a few of the 1915 distributers.

The Remy is another example where the details of design vary with practically every installation. The range of advance is a good example of this. For instance, on the Chalmers 35 the distributer has a 50-deg. advance. On the Oakland 32 a 40-deg. advance, on the Reo 4 a 44-deg. advance, and on the Reo 6 an advance of as much as 60 deg.

The advance in motor speeds has not caused any change in the principles of breaker mechanism on this system, as on road and block tests the limit of efficient spark production has not been reached in practice. The cam faces are ground and inasmuch as a spark occurs at the opening of the points, synchronism is maintained, regardless of engine speed. This system operates entirely on the closed-circuit principle, the points being knocked apart by the cams which rotate at half engine speed.

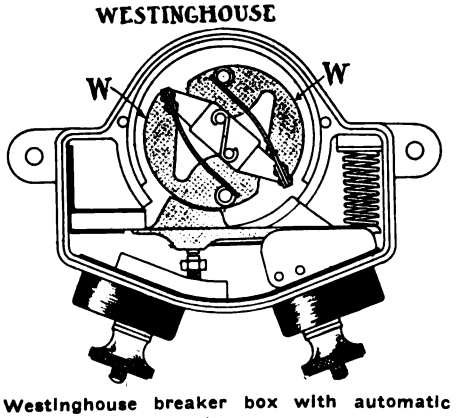
The Remy battery ignition system differs from others in that the advance and retard mechanism is entirely separate from the distributer cover. When the timing lever is moved the cover remains stationary, obviating the necessity for moving the wires and avoiding the possibility of chasing the insulation.

Westinghouse Has Automatic Advance

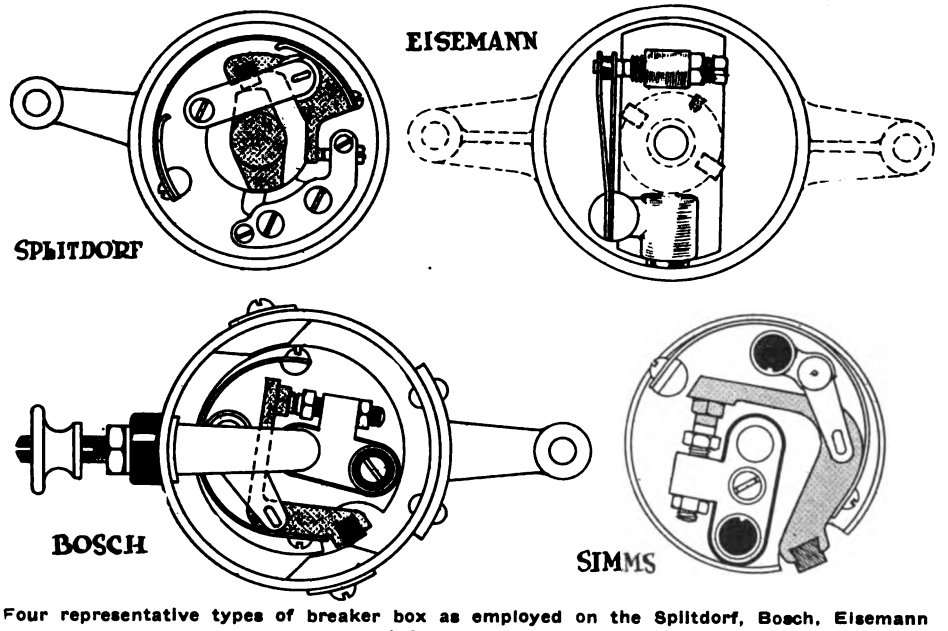
Automatic spark advance is one of the features of Westinghouse ignition. This automatic advance operates over a range of 45 deg., but provision is also made for manual operation. The spark lever, however, need not be touched when running if it is not desired.

The principle upon which the system operates is the closed circuit, and the centrifugal weights are a factor in the interruption, the operation of the ignition system beginning with the making of the primary circuit of the coil when the centrifugal weights governing the automatic advance push down the fibre part known as the bumper, allowing the interrupter contacts to close. This sends the primary circuit through the core of the coil. At the time the spark is desired the contact points are suddenly released under the influence of the bumper spring and the spark is made.

As the speed of the engine increases the weights are thrown out from the center and automatically advance the time of closing or opening the interrupter contacts and hence advance the spark. At the same time, due to their shape, they keep the contacts closed during a greater part of the revolution when running at high speed, thus making the time period



Westinghouse breaker box with automatic advance



Four representative types of breaker box as employed on the Splitdorf, Bosch, Eisemann and Simms magnetos

of contact practically the same for all speeds and preventing the spark voltage from falling off at the higher rate. This in a way combines the advantages of both the open and closed circuits.

Detachable Distributor

A separate ignition system is also marketed for systems that do not contain timing, distributing and high-tension parts. It has the same type of circuit breaker as that just described except that there is no automatic spark advance feature. The interrupter on this is equally efficient running in either direction.

The Westinghouse distributing mechanism is of the usual flat-faced type, but is specially designed so that the detachable distributer plate can be readily placed in position without interfering with the contact brushes and without the use of tools.

In many of the installations the ignition coil is made an integral part of the generator, giving an arrangement which is very similar in compactness to that of a magneto. The coil is solidly embedded in the insulating material of the distributer plate and all connections are made automatically by putting on the distributer plate and inserting the holding screws without the use of tools. In this way no wiring is required between the generator and coil.

There are several types of ignition switch which are standard. The one most used is the snap type, combining in the same face plate the ignition and two lighting switches. The direction of current through the interrupter contact is reversed every time the switch is turned on, which reduces the wear on these points.

MacNish for Eights

L. P. Halladay Co. is making a special design of the MacNish ignition system for the eight-cylinder high-speed engine, this being an innovation this season. The breaker lever in this eight-cylinder design is faster than former models and the coil is especially wound to give the rapid action necessary for the multi-cylinder motor when it is running at very high speed.

In principle the eight-cylinder design does not differ materially from the six or the four. The same scheme of current regulation, which is mechanical and requires no adjustment, and the same positive breaker action are employed. Both hand and automatic advance is supplied on this system, and the machines for eight-cylinder cars are guaranteed to work perfectly at 3500 r.p.m., or in general at speeds higher than are reached by the commercial eight-cylinder engine, either on the race track or on the testing stand.

The Halladay system operates on the open circuit and the position of this concern on this matter is that the excess current drawn in operating other types of apparatus is an important factor. The statement is made that the actual waste in some instances is large. The greatest amount of waste occurs at low speeds, it is stated, exactly in that part of the speed range where the generator is working at the smallest electrical advantage.

The 1916 MacNish models are made for four and six-cylinder cars with automatic advance, with four and six-cylinder cars with hand advance and eight-cylinder with automatic. There is also a special fitting for the Ford, and the machine may of course be adapted to a large number of cars having vertical timer shafts. The coil is regularly wound for 6 volts, and may be used with dry cells. It is possible also to operate this system from the generator if the battery fails. The coil is cylindrical and is adapted for attachment to the dash, engine or generator.

Bosch Line Complete

Magneto design has been fairly well standardized for the past few years, and only the introduction of new types of distributer and breaker mechanism to meet the demands of eights and twelves has caused any innovations in the field.

The Bosch line for automobiles now comprises principally the N-U 4, D-U 4 and the Z-U 4. For heavy duty work there are the Z R and Z types, for the six-cylinder cars the same line is used only known as D-U 6, etc.; besides these there is the Bosch vibrating duplex outfit, which has become standard on several makes of cars for this year.

With this complete line every zone of motor design is covered, the smaller four can be taken care of by the N-U 4 magneto which was brought out about one year ago, and is fitted regularly on some of the smaller displacement fours. For intermediate fours the D-U 4 and Z-U 4 are used, the letter Z in Bosch nomenclature standing for waterproof construction and in general a Z magneto has replaced a D of the same general design, except that it was not waterproof.

The N-U 4 is a distinctive small car design, in which the aim has been to reduce weight while at the same time providing an efficient and hot spark. The lightness has been secured by the elimination of the distributer as an independent part and the work of the distributer has been turned over to the slip ring, which in this design is double, instead of single, and which has two grooves into which bear four brushes in sets of two. Each groove has two brushes at a distance of 180 deg. apart. Into these grooves are imbedded two metal segments, each at 180 deg. apart, taking the place of the distributer and passing the high-tension current to the brushes, from which it is taken directly to the plugs.

With this arrangement two sparks are provided for a revolution, and since the magneto is driven at crankshaft speed there is an ineffective spark one revolution behind the effective spark, so that in timing care has to be taken that the inlet valve is not open when this spark occurs, and preferably that the exhaust is still open.

The Bosch vibrating duplex ignition system offers a simple and positive method to permit easy starting. It is recognized that in the magneto the armature shaft must reach a certain speed before the magneto output is up to normal. At this time, also, the effects of inferior gas mixtures due to low grade fuel renders necessary a good spark. With the vibrating duplex system a low-tension vibrating duplex coil is thrown into connection with the primary winding of the regular high-tension magneto, pro-

viding a hot vibrating spark at the low speed. When running at the normal speeds, the vibrating coil is thrown out and ignition is provided by the magneto.

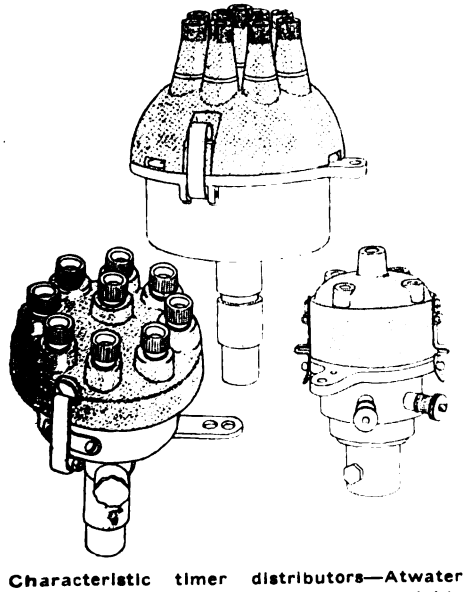
Vibrating Duplex

The principle of operation is that the battery current, upon reaching the coil terminal with which the coil winding is connected, passes through the winding to the iron core, thence to a flat vibrator spring with its contact, then to the adjustable vibrator screw and finally out of the coil by means of the second terminal. When the complete battery circuit is established the coil winding acts as an electro magnet giving a vibrator action, causing the intermittent spark. The switch permits of an off position, in which the battery circuit is interrupted and the magneto is grounded, next a battery position in which the switch connection between the magneto and ground terminals is interrupted, affording the battery current a direct path to the grounding terminal of the magneto. Besides, there is a magneto and a coil and magneto point. This permits of starting with the vibrating duplex system and then switching to the magneto.

The other Bosch magnetos are straight high-tension designs with the Bosch breaker and distributer plates which have been used for some time past.

Remy Uses Shuttle Armature

Remy magnetos are marketed under the model names of P, 30, 31 and 32. These instruments are all of the shuttle or H-shape armature type, which are designed to produce a dynamic spark at low armature speeds. The Remy model P is designed for ordinary automobile use, and 31 is also for passenger car service, while models 30 and 32 are for trucks and tractors. The model P is a single distributer instrument and the 31 has a double distributer.



Characteristic timer distributors—Atwater Kent six, Connecticut four and Remy eight

The armature of the Remy magneto carries only the low-tension winding. The coils for producing the high-tension current are separate and are generally mounted behind the dash. The switch is in a unit with the coil and in general practice projects through the instrument board. In the construction of these magnetos, the armature is made up of layers of soft Norway iron to secure maximum magnetic permeability. The armature heads are made from hard bronze and the shaft is cast integrally with the head, providing a rigid construction with the two different metals joined to provide minimum weight.

Waterproofness is secured by the use of a new design of Bakelite cover plate which also excluded the dust from the distributer parts. The terminals which are fastened to the outside of the cover plate, give an exceptionally accessible layout. Timing is simple on this magneto as by means of a timing button, the circuit breaker can be brought to the proper position to indicate the break in the primary circuit. In timing, the engine is turned over until No. 1 cylinder is on top center on the compression stroke. At this time, the button at the top of the distributer is pressed and the magneto shaft is turned until the plunger of the timing button drops into the recess of the distributer gear. In this position the magneto is coupled to the motor and the timing is complete.

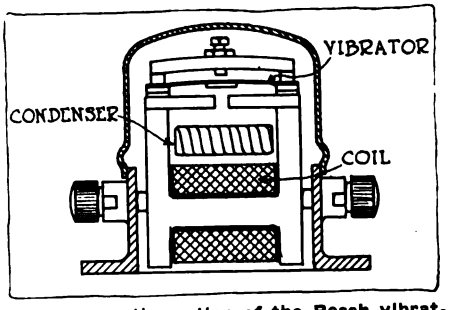
Eisemann Markets Nine Models

No changes have been made in the Eisemann instrument during the past year, although a new flexible magneto coupling has been introduced during the interval. The increase in motor speeds during the year have not caused any changes to be made in the design of the breaker or distributer mechanism as these have been found to be fast enough to take care of the increased demands.

The Eisemann magnetos were modeled after the German make of the same name and since these magnetos were supplying current for the European designs which are of high-speed characteristics, no new problems have been introduced by the increased speed in this country. The timing range of advance on these magnetos is 35 deg. on the crankshaft with the manual spark control. On the automatic advance type, however, there is a range of 60 deg. advance. These magnetos are guaranteed for 2500 r.p.m. on four-cylinder motors and 3500 r.p.m. for sixes.

Waterproof Designs

The present magnetos are waterproofed by having the magnets covered and by fitting a patented distributer plate which prevents water, dust or oil from reaching the high-tension terminal. The make and break mechanism is likewise protected by a waterproof cover. The models made are now designated as follows: G4, fixed spark or manual control for four-cylinder motors; GN6, manual spark control for six-cylinder motors; GA4, automatic spark control for four-cylinder motors; GNA6, automatic control for sixes; EMR4, dual ignition for fours; EME6, manual control, dual ignition for sixes; EMAR4, dual with automatic spark control for fours; EMAR6, dual with automatic spark control for sixes; and G1, G2 and G3, single ignition with manual control or fixed spark for one, two or three-cylinder motors.



Diagrammatic section of the Bosch vibrating duplex coil showing housing of coil and condenser with vibrator mechanism

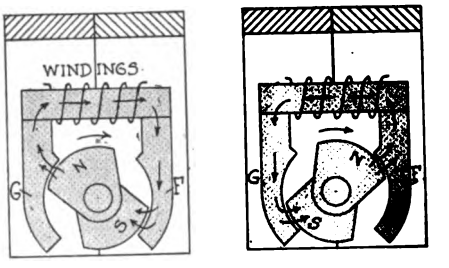


Diagram showing how the direction of the lines of force in the Dixie magneto is changed twice in each revolution

For any of these models, the Eisemann impulse starter can be fitted which facilitates starting in very heavy motors or motors with very high compression, a special fitting for Fords is also made consisting of an attachment which can be easily fitted to that car to provide it with Eisemann magneto ignition.

One of the features of the Eisemann magneto which is distinguishing is that at no time is the armature separated from the magnetic field. In this way the armature acts as a keeper and permits the magnets to retain their magnetism.

Splitdorf Dixie for Twelves

The feature of the Splitdorf announcements for 1916 is the addition of a twelve-cylinder model to the Dixie line. This new magneto operates on the same principle as the other Dixie model, having stationary winding and no armature in the general sense of the word. The four automobile models are designated as 40, 60, 80 and 120 for four, six, eight and twelve-cylinder engines.

(*Continued on page* 1081)

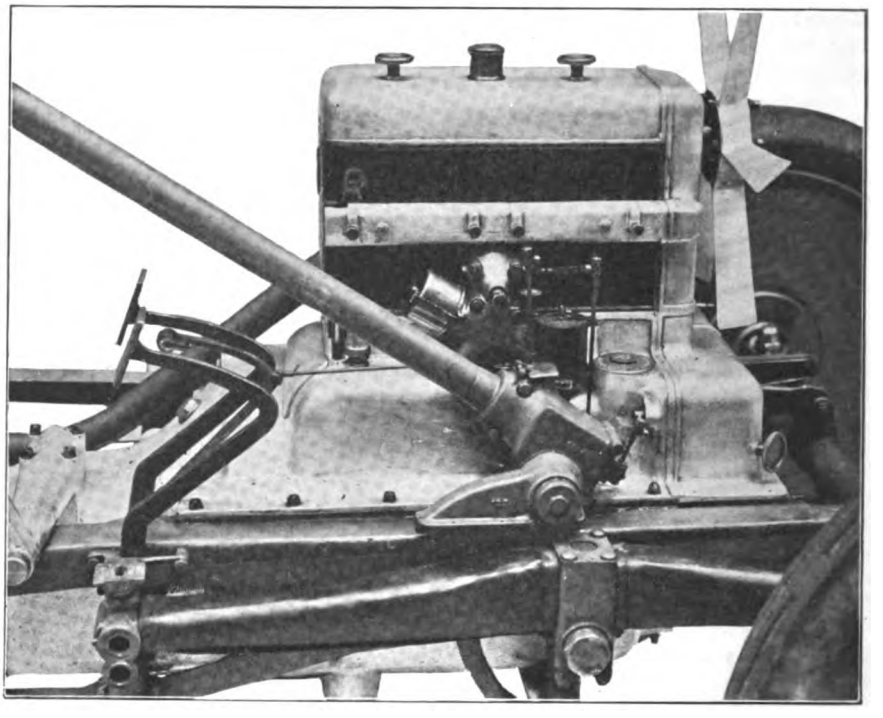
Irish Car Is Self-Lubricating

British Design in Which Every Portion of the Chassis is Lubricated Automatically—Europe's Chief Contribution to Engineering Progress of the Year

IN a time of engineering stagnation, such as is the present time in Europe, it is possible to chronicle the appearance of one new car which is more utterly new than anything that has been seen for a good many years. While engineers have been working along certain lines of motor development the creator of this new car has turned to other matters and has accomplished something that ought to give the engineers seriously to think. The main idea of the new chassis is that beyond filling up the gas tank and putting oil into the motor nothing else whatever need be done to it throughout a season's use. There is not a greaser nor an oil cap which need be touched save at intervals of many months.

About the main parts of the car there is nothing radically new, it is a sane design in its principal details, combining much of British, French, Italian, and American practice; it is in the detail that the work of its designer mainly lies.

At first reading the impression will certainly be gained by most engineers that the chassis is not practical, that it is commercially impossible. Studied attention to the detail, however, shows that this first impression may not be right. Probably the principles could not be applied to a cheap car, but they could be applied where a moderate price is obtainable and the owner who once had the advantages offered him by this self-lubricating system would never want to return to the conventional type of car.



The four-cylinder 3⅛-in. bore motor is 16¼ in. long over all. This view shows the side of the crankcase which has the reserve oil reservoir, and the cap thereof. The leather inclosure of the automatically lubricated spring is also shown. Observe that the spark plugs are protected by a cover which has cut-out buttons

The new car is not yet being manufactured, though a few are being built by the designer, J. B. Ferguson, owner of a repair shop and garage in Belfast, Ireland. Mr. Ferguson has been in the repair business for many years and has slowly developed the design of his car, always with the thought of overcoming difficulties with ordinary designs which his daily work revealed. The generalities, the four-cylinder engine for example, may not be suitable outside Europe, but the detail has world-wide application, in fact the rougher the country the greater the advantage of the car's self-lubricating power.

Main Layout Ingenious

However, the main ideas of the design apart from detail are too unusual to pass over without mention. For details of the engine the drawings are almost sufficient. The overhead camshaft is driven by skew gears on a vertical shaft and the exhaust valves seat direct in the cylinder heads. The inlet valves are in cages, and by taking out a cage the exhaust valve can then be extracted. An American engineer would prefer to use a detachable cylinder head but the Ferguson design is certainly lighter. A special tool is provided with which carbon deposit can be scraped out without removing the cylinders. The small holes shown are for the purpose of carrying water completely around the cylinders, and are drilled after the casting is made, not cored in, the advantage of this elaborate operation being that several inches of length are saved.

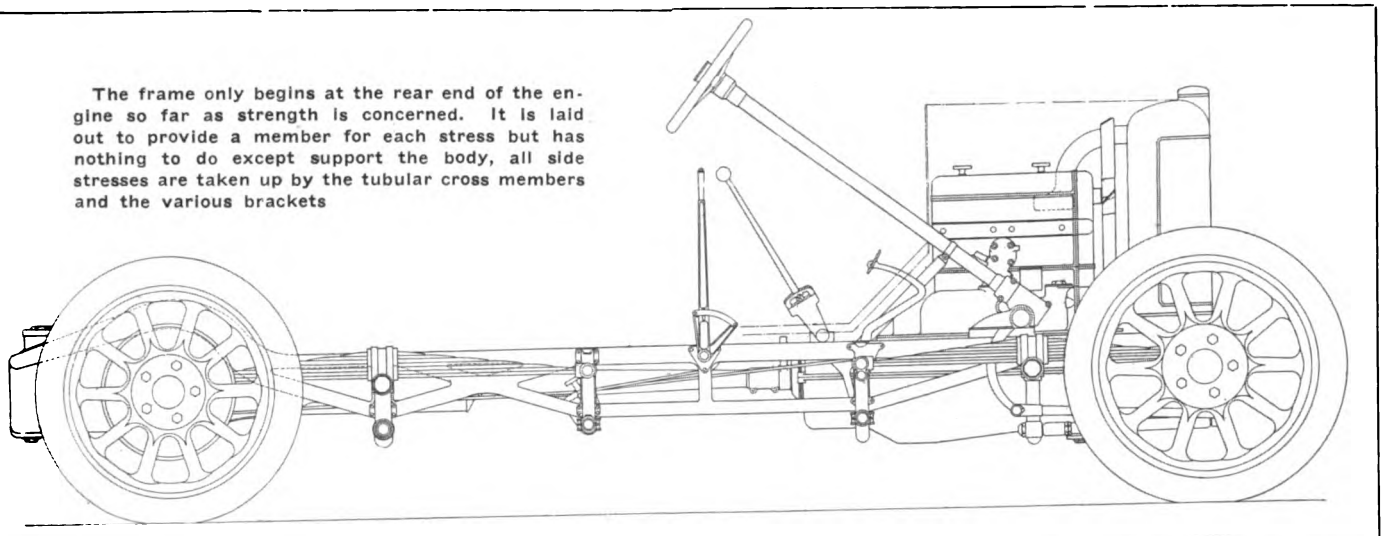
However, to come quickly to the lubrication, the engine has a complete pressure supply, even the piston pins being fed through small aluminum tubes which are carried up the connecting-rods. The ingenious feature of the engine oiling system is that an auxiliary tank holds about 1½ gal., this being cast integral with the crankcase. Oil poured into the filler first charges this auxiliary tank and then overflow supplies the crank chamber. Afterwards, when the level in the engine gets low, pressure on a knob on the side of the crankcase sends some of the reserve into the main part of the crankcase. The effect is that a supply of cold oil is always available.

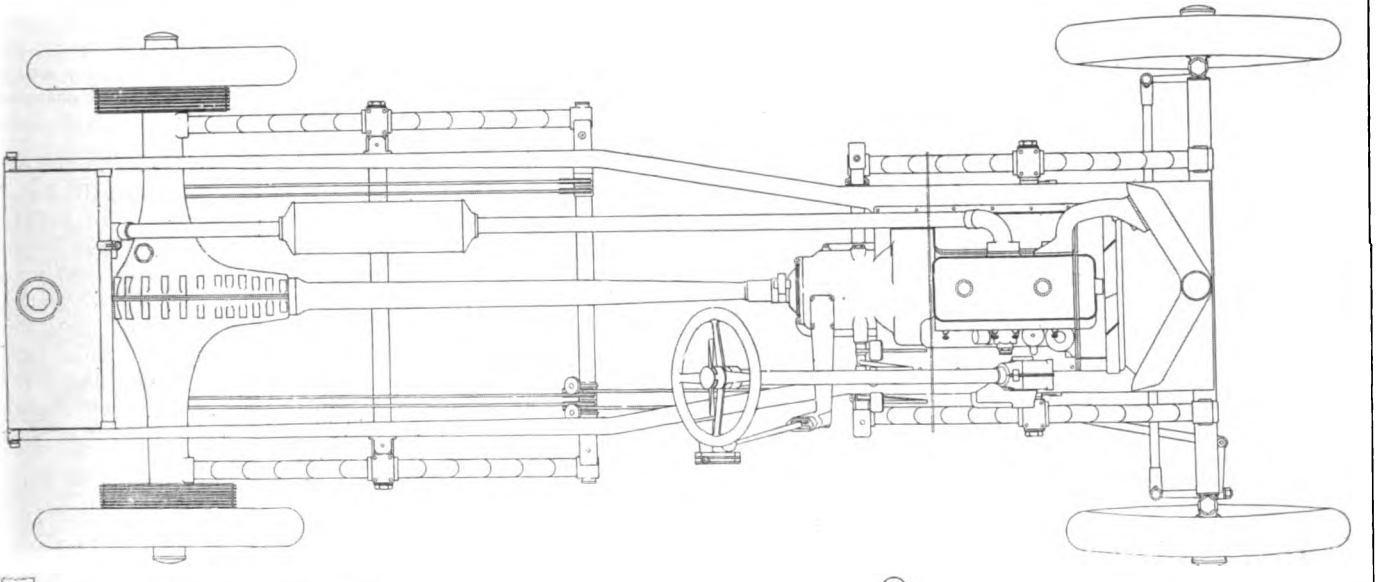
The oil supply to the cylinders is controlled by the throttle so as to proportion the oil supply to the work the engine is doing. The control consists of deflector guards which are arched over the crank webs and catch the oil flung off. As the carbureter throttle is opened these guards are drawn back and more oil thus allowed to pass into the cylinders.

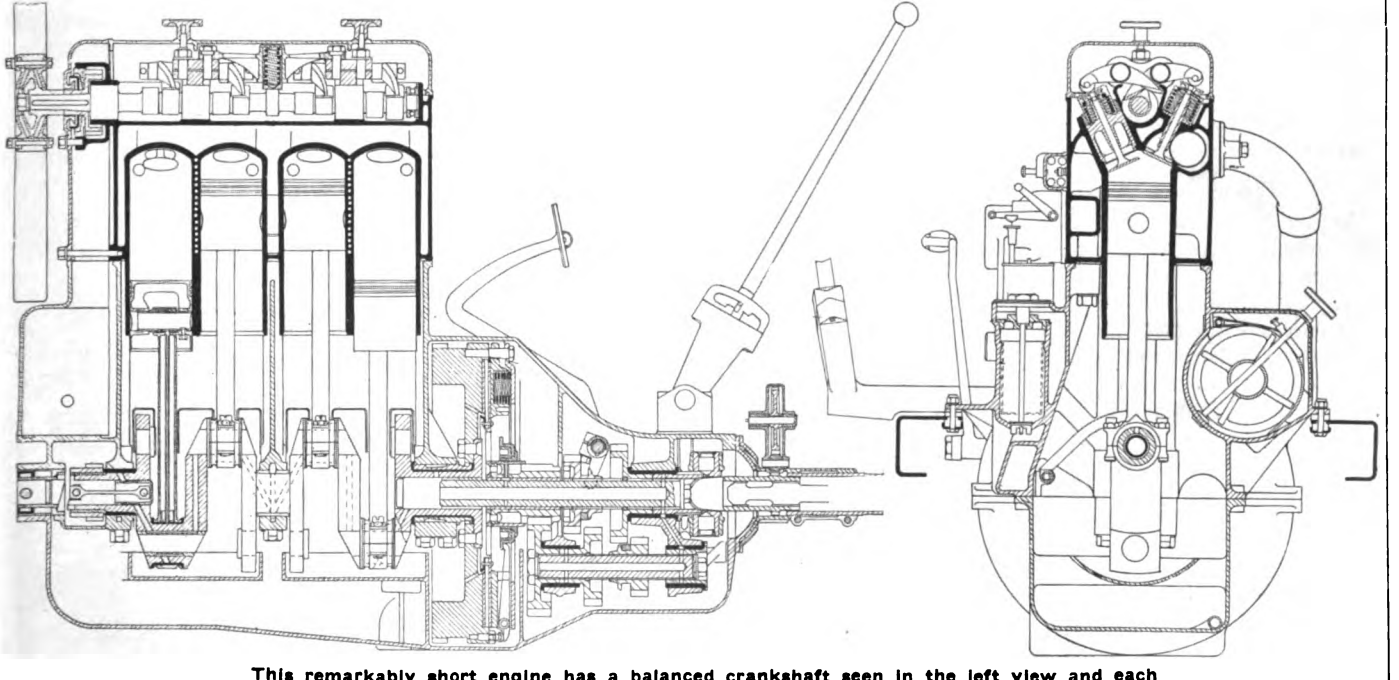
Oil Fed to Gearset

It will be noticed in the drawings that the crankshaft has the end of the hollow main shaft of the gearset spigoted into it, so the oil that is fed to the interior of the crankshaft by the engine pump also passes into the gearbox and lubricates

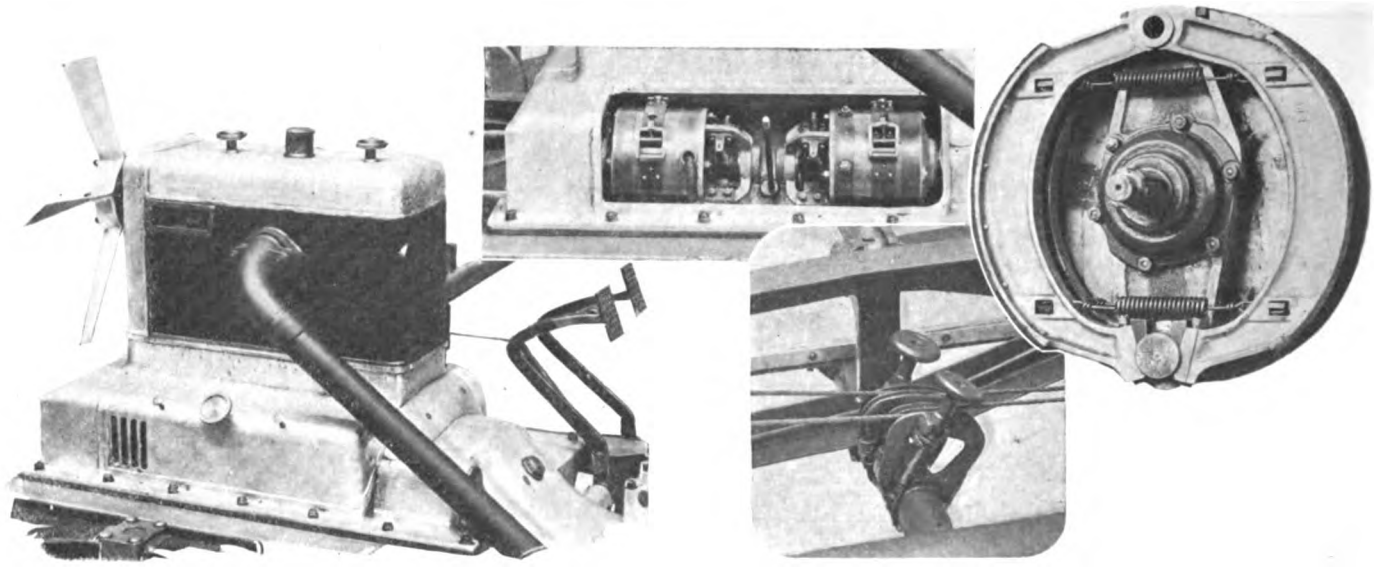
The frame only begins at the rear end of the engine so far as strength is concerned. It is laid out to provide a member for each stress but has nothing to do except support the body, all side stresses are taken up by the tubular cross members and the various brackets







This remarkably short engine has a balanced crankshaft seen in the left view and each crank web has a guard above it made of sheet steel. The guards are linked to the throttle lever and move with the throttle, so regulating the oil supply to the cylinders. The gearset is shown larger on the next page. In the transverse view the generator is seen in its case on the right of the cylinder and the reserve oil tank on the left



Left—Electric equipment side of motor with cover in place. Above—Inset, the cover taken off, disclosing the generator and starting motor. The carbureter draws its air through this compartment via the slots seen in the cover. Right—Brake shoes with taper wedges screw operated, for taking up wear. Below—The intermediate brake shaft with quick adjustment for contracting the brake operating wire cables

each of the plain bearings therein, under pressure. A supply is taken from the tail bearing in the gearset to the corresponding countershaft bush and then returns to the front bearing through the countershaft. Plain bearings are, of course, used for quietness, and their permanent good condition is insured by the force fed oil. The clutch is also fed with oil and to prevent this accumulating in the flywheel housing, gutters are cast on the sides of the casing. These catch any oil that may be flung off from the flywheel and conduct it back to the gearbox. A very clever feature of the clutch is that the central member, which is a single disk covered with an asbestos fabric, is fixed rigidly to a sleeve, which sleeve is an extension of the constant mesh pinion. Thus the pinion slides a little every time the clutch is operated, the teeth being made a little wider than usual to allow this sliding to take place without affecting the meshing of the pinions. The idea eliminates a sliding joint and is a true simplification.

In the gearset it may be noticed that unusual shortness is obtained by making one of the countershaft gears to slide. The sliding gear on the upper shaft gives high and intermediate while that on the lower shaft gives low and reverse.

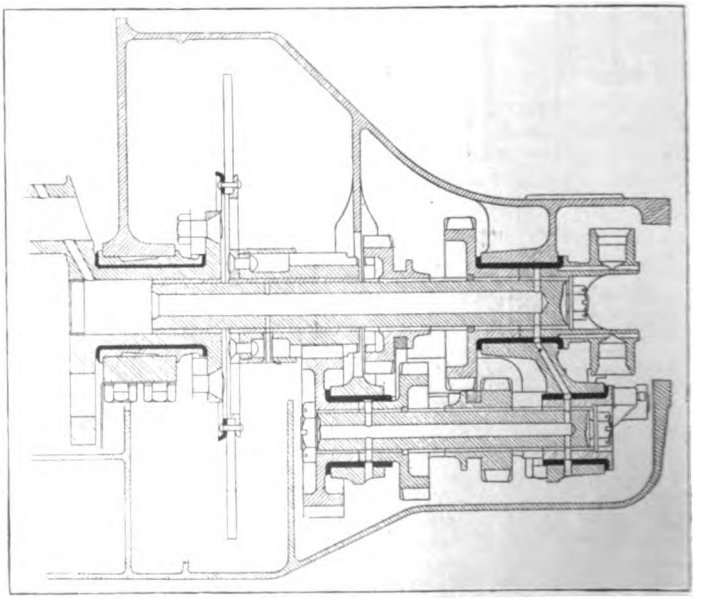
How the Springs Are Oiled

Returning to the lubrication of the chassis, from the engine pump a lead is taken right around the whole chassis, returning to the engine crankcase after completing the circuit. From this pipe every part of the chassis except the rear axle and the steering gear is lubricated. The oil in this main supply pipe is not at high pressure, since there is nothing to retard its flow to the crankcase except the friction due to the bore of the pipe. Also it should be pointed out that the oil supply is not liable to vary very greatly with the weather, since the oil starts on the circuit hot from the engine.

The springs are cantilevers, both front and rear, and oil goes to the fulcrum pins at the center of each spring. Thence oil goes up the hole in the center of the spring and down small grooves cut on each spring leaf. To prevent rusting and exclude dirt each spring is inclosed in a leather case which also covers the slides at either end of the spring, for slides are used instead of shackles. For the front axle radius rods are necessary, and the ball joints at either end of these are lubricated from the springs by taking the overflow through a small pipe to the interior of the hollow radius rod. With respect to the spring leaf lubrication, it should be explained that the oil groove in each leaf is covered by the leaf above it so that oil starting on its journey at the center of the top leaf descends by a series of steps till finally it reaches the extremities of the bottom leaf. To prevent the springs receiving too generous a supply, the hole joining the inside of the hollow spring pivot pin with its bearing is drilled so that it points downwards. To get to the vertical hole in the spring plates and so to the leaves, oil must first pass through the pivot pin bearing, and the hole being downward the weight of the car effectually closes the orifice when the car is standing still. The amount of oil allowed to reach the spring leaves depends upon the amount of work the spring is doing.

Excess oil from the rear end of the rear springs is taken to the brake actuating shafts on the rear axle, excess from the front end of the rear springs going to the equalizing shaft on the chassis, while the oil that seeps from the rear end of the front spring goes to lubricate the pedal shaft. It may be added that oil from the brake actuating shafts on the rear axle finally goes to the axle interior, maintaining the level therein.

The steering gear is not lubricated from the engine but holds within itself enough grease for six months' service.



Detail of gearset and clutch plate shown to a larger scale than in the engine illustration on the previous page

This is usual, but the tie rod and the drag link also hold six months' supply or more, for the ball joints at either end of these rods are fed with oil contained within the tube. On the tie rod near the middle is a screw cap and another is located on the drag link. Removing these allows the tubes to be filled with oil, and this gets to the ball joints through small holes. The cups that grip the balls are held up by strong springs, so the oil cannot leak out, it is merely allowed to seep over the balls and cups when the latter are moving. Throughout this elaborate lubricating system the detail is designed with covers and caps to prevent the escape of oil, and these also serve to prevent the ingress of grit with complete effectiveness.

Not a Question of Expense

The most remarkable thing of all, however, is the fact that all these oil channels, caps and covers are so simple and cheap to make, that the extra cost of the circulating oil supply to springs, etc., is not excessive. It could not be done on a $750 car perhaps, but there is no reason why it should not be part of the scheme of any car costing over $1,500. So far nothing has been said about the lubrication of the hinder end of the transmission. The universal joint gets its oil from the gearbox and is contained inside a ball housing, which takes torque and drive, being the head of a steel tube bolted and clamped to the aluminum axle case. From the universal a small amount of oil is allowed to escape down the torque tube, so reaching the rear axle. Therein it is continuously conducted to the interior of the differential by a fast pitch thread, cut on one of the drive shafts, and from the differential centrifugal force drives the oil to all the bearings. The ring gear picks up the oil in the bottom of the case and a scoop is arranged near the top of the case which catches this oil and leads it back to the thread on the drive shaft, so the axle has an independent oil circulating system peculiar to itself.

On the back of the casing is a dirt trap and a level cock which, it is claimed needs only to be operated every six months, ample precaution being taken to prevent too great a supply of oil reaching the axle.

A Trouble-Eliminating Design

The lubrication system of this remarkable car is not by any means its only feature of particular interest as there are many points besides. It would, perhaps, be well to again point out that the design is based upon twelve years and more of repair shop experience and is entirely colored by that. It is a trouble eliminating design before everything else.

Take, for example the fitting of the starting motor, which engages the flywheel in the customary manner, and of the generator. These are British made units incidentally, and are contained within a casing integral with the crankcase on the left side, corresponding in position to the reserve oil tank on the right side. Over them fits a cover that is detachable like a valve cover plate, and to keep the compartment cool the air for the carbureter is drawn through the casing. Thus the electrical units are completely protected and yet ventilated. Even the spark plugs are covered by a ventilated aluminum case which would prevent water or dirt from reaching the plugs; and a neat detail is that the case has a cut out button opposite each plug terminal so the firing can be tested in a moment by the pressure of a finger without tools and without any risk of shock. Again, the cost of this cover is very small.

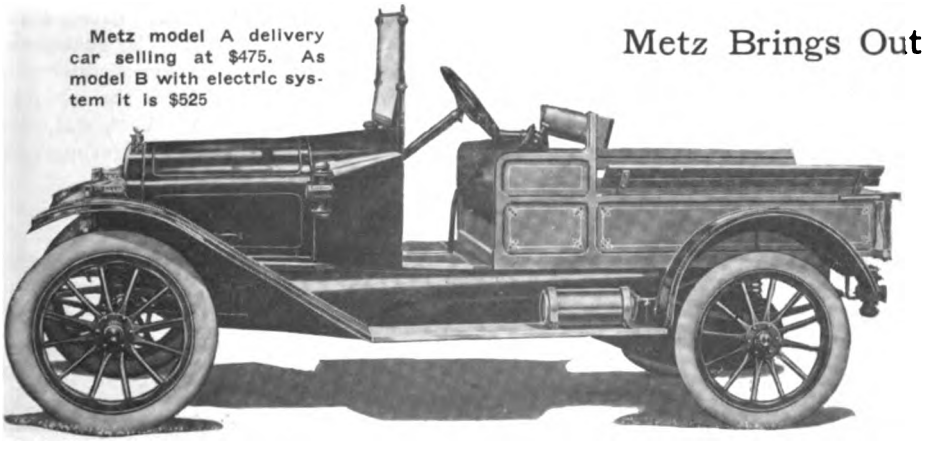
Then take the frame: this is rigid for the length of the motor, in fact the motor is a solid block rearwards from which the frame projects and it has nothing to do except to support the body and the brake countershaft. To give rigidity the section is very deep and is cut out in panels so that it becomes the equivalent of a bridge girder with a member for each stress. It is credited with a rigidity equaled only by the Brush frame, and is at least as light, while there should not be very much difference in the cost. The engine carries the radiator on an extension of the crankcase and the whole power plant sits upon rubber strips, so making a vibration insulating connection with the frame sides.

For fuel supply from the rear end tank a novel system is employed, there being no suction feed and no air pressure. Instead, the exhaust pipe end in a casting of wide, flat section, and this is carried down the back and across the bottom of the tank. The vapor from the gasoline thus created, has sufficient pressure to raise the fuel, once a few strokes of the hand pump have started the flow.

Not a Freak Design

A careful study of the drawings and photographs will disclose many other details of equal originality, but the great importance of the chassis, for it does possess a very great importance, is that it is altogether out of the rut. It is not a freak design as it follows quite ordinary European practice, perhaps it is best described as a good car such as could have been and has been produced by many a European engineer, taken in the rough state and finished off. It is expected of a good car that it will run for years without trouble *if it has proper attention.* Mr. Ferguson has aimed to eliminate that attention. His car can be driven all day and every day for six months without anything whatever being done save pour in gasoline and fill the engine with oil. Not only does nothing else *need* to be done, *but there would be nothing whatever gained in service or performance by doing anything more.*

The idea is so novel that it needs a little mental effort to grasp it, but there is not an automobile driver or user in the world who would not appreciate such freedom from labor. Even the six-monthly task of filling up the steering parts charging the front hubs and testing the oil level in the axle would occupy less time than is taken *every day* by a careful user in going over the grease cups on the spring shackles.



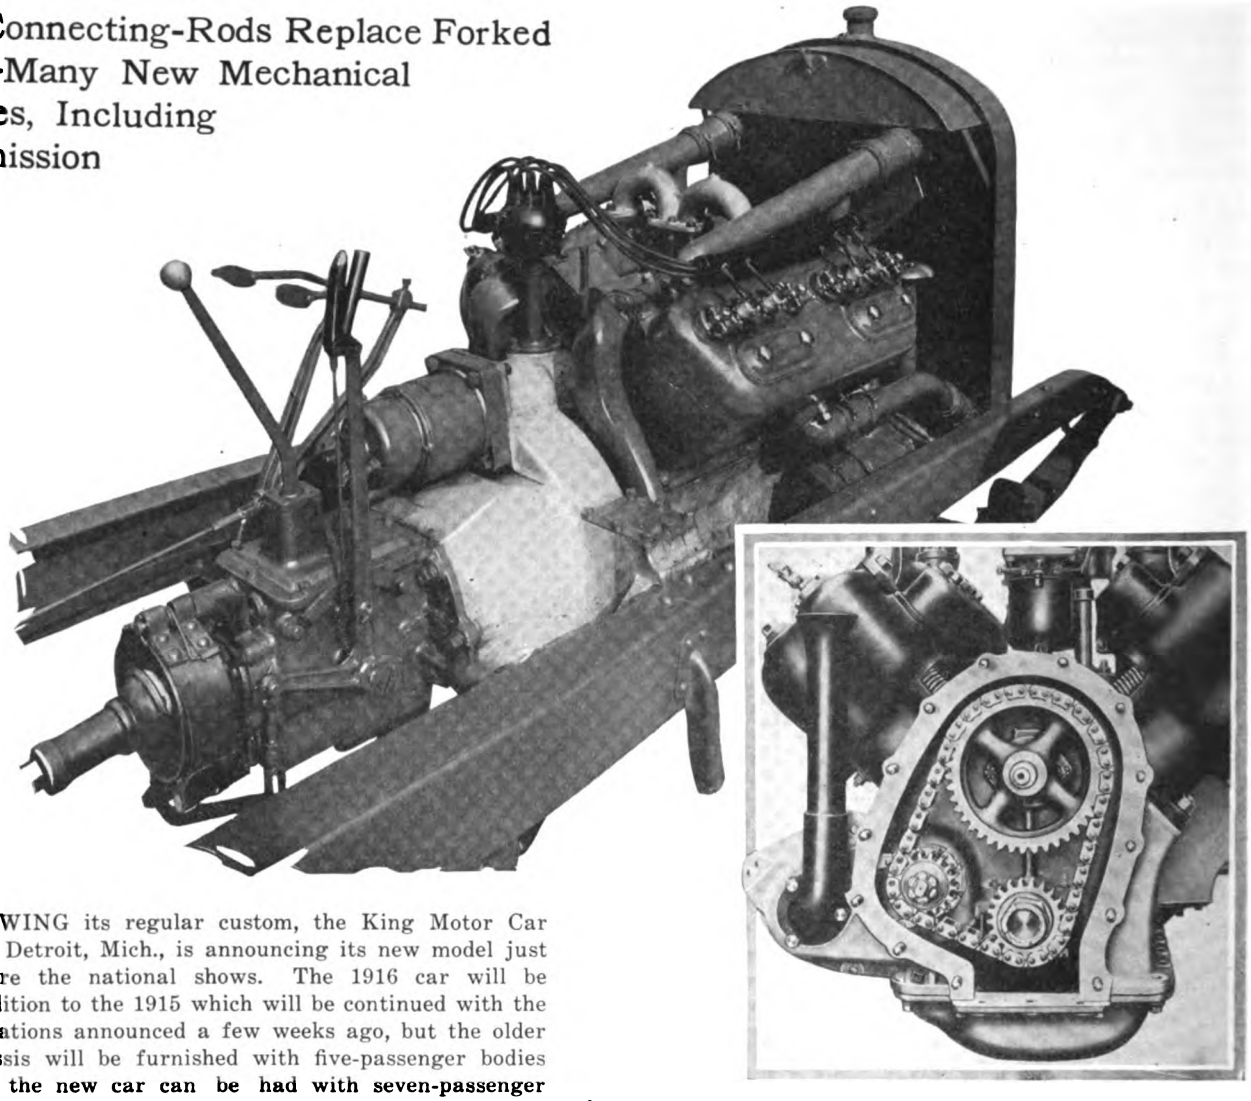
Metz model A delivery car selling at $475. As model B with electric system it is $525

Metz Brings Out Three Delivery Cars

THE Metz Co., Waltham, Mass., has placed on the market three types of delivery cars in addition to its roadster and touring car. All are on a 25-hp. chassis, model A, having an express body selling for $475, with Prest-O-Lite tank and oil side and tail lamps Model B is the same except that it has Gray & Davis starting and lighting and sells for $525. Models C and D correspond to models A and B, respectively, except that they have roll side curtains, model C listing at $525 and model D at $575. Model E uses the Gray & Davis electric system and has a closed delivery type body. It sells at $600.

New King Eight Is Seven-Passenger

Plain Connecting-Rods Replace Forked Type—Many New Mechanical Features, Including Transmission Brake



FOLLOWING its regular custom, the King Motor Car Co., Detroit, Mich., is announcing its new model just before the national shows. The 1916 car will be built in addition to the 1915 which will be continued with the slight alterations announced a few weeks ago, but the older design chassis will be furnished with five-passenger bodies only, while the new car can be had with seven-passenger touring body, five-passenger roadster or sedan equipment. The price will be $1,350, the wheelbase is 120 in. and tires 34 by 4 in.; equipment, of course, being of the fullest possible kind.

A rearrangement of the springs has permitted the body to be lowered a little and this, in conjunction with most happily chosen body lines, has produced a car of very distinctive appearance. There is a sense of luxury given by the look of the car which is impossible to describe.

Power Plant Is Clean Design

The new motor is 3 by 5 in., giving 282.7 cu. in. piston displacement and is essentially a high-speed type, being geared but a little above 5 to 1 on high. Only a slight amount of stagger has sufficed to permit the use of side by side connecting-rods, these having adjustable bearings of the usual kind. Pistons are Lynite aluminum alloy cast in permanent molds and the wristpins are arranged to rock direct in the pistons. Very special pains have been taken with the design of these pistons so as to render smoking practically impossible and the results are exceedingly satisfactory.

There are three main crankshaft bearings and all oil is forced from the pump through the crankshaft, to the connecting-rod bearings, the pump being situated at the rear end of the crankcase driven off the bottom of a vertical shaft. This shaft has the Atwater Kent distributer with automatic spark advance mounted at the upper end and the driving gears for it are on the extreme rear end of the camshaft, so the distributer comes just in front of the dashboard, in a very accessible position.

The front end has a silent chain drive, with adjustment on an idler with eccentric bushing between the generator and the crankshaft, this giving a triangular main drive with separate chains for camshaft and generator. The generator lies snugly beside the crankcase where it cannot interfere with the accessibility of any other part. With the generator in this location and the distributer at the back end, the valve alley is clear of everything except the carbureter, which, by the way, is a special King design.

Combined Intake and Exhaust Manifolds

A very neat idea in connection with carburetion is the combination of intake and exhaust manifolds, these being cast in one, as shown in the halftone illustrations. The compound manifold provides the necessary warmth for the gasoline without the complication of a water-warmed manifold or a carbureter jacket.

Another feature which is unusual and also makes greatly

for accessibility is the position of the starting motor, this being mounted on top of the clutch housing, meshing with a flywheel ring gear in the usual way. Both the generator and motor are made under Ward Leonard patents and the battery is a Willard.

For cooling, the thermo-syphon system is employed, this being particularly efficient in V-motors, owing to the low position of the cylinders relative to the radiator, and it is noteworthy that the exit pipes from the cylinder blocks are so arranged that the water has a particularly free circulation around the valves.

Tire Pump on Gearset

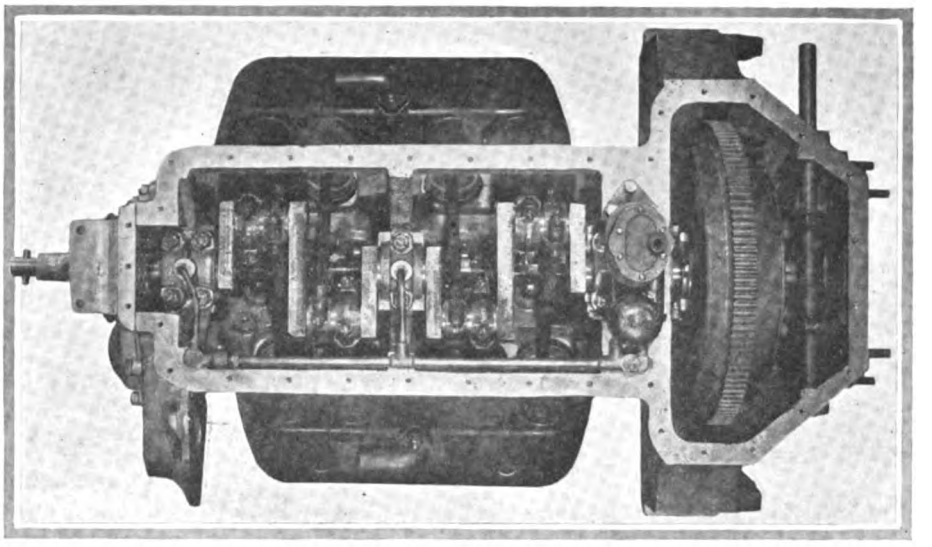
On the side of the three-speed gearset the tire pump is mounted, this having a sliding gear that meshes with one of the countershaft transmission gears when the pump is in use. In this place the tire pump is out of the way and cannot interfere with any engine accessory, while it is just as convenient for use.

Transmission Brake Used

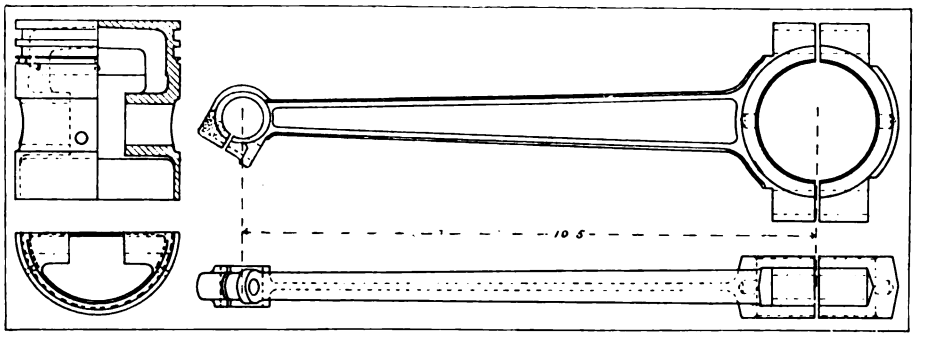
Behind the gearset, mounted on the tail end of the main shaft and embracing the universal, is the transmission brake, which is linked to the emergency lever and has abnormal power. It is a simple type of band brake with toggle actuation needing very few links between the brake and the lever, while the release springs are arranged in such a way that dragging on the drum is impossible. A substantial casting which bolts to the back of the gearbox carries the fulcrum pin of the brake. Aft of the brake is an open propeller shaft with a universal at each end, there being a short torque stay arranged to divide the angular bend equally between the two joints, according to the proper principles of universal joint layout explained by C. W. Spicer in his recent S. A. E. paper. The driveshaft is tubular and so long that the joints have but little work to do.

Rear Axle Light

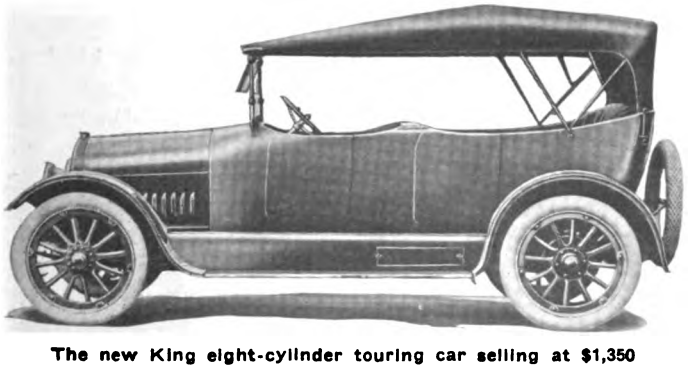
Owing to the use of a transmission brake, the rear axle is particularly light and neat, having no brake rods on it as the contracting service brakes are operated by direct pull rods from the cross-shaft. The latter has no balance beam, but the natural elasticity of the rod gives an equalizing effect. Spiral bevel drive is employed and the axle is a full-floating type. The long cantilever springs are clipped beneath the axle and transmit the drive to the swivel brackets, the front ends of the springs being shackled. For the frame a very strong section has been selected of unusual depth, and the principal cross-member is made of the crankcase arms at the rear of the motor; in front there is a dropped cross piece which supports the front end of the power plant and the radiator.



Bottom of crankcase of the new King, showing details of the crankshaft and connecting-rod mountings. Note lubrication to main bearings. Also silent chain front end drive



Details of piston and connecting-rod design in the new King. The pistons are Lynite aluminum alloy cast in permanent molds. The wristpins rock direct in the pistons. This is the short piston of hourglass type credited as being proof against smoking



The new King eight-cylinder touring car selling at $1,350

Luxurious Bodies

Internally, the body is in keeping with the luxurious appearance already mentioned. It is finished in the best possible style and upholstered with a lavish use of stuffing and leather. A detail of equipment immediately noticed by anyone acquainted with other King models is the absence of the folding steering wheel, but a trial soon shows that the new body gives so much room that the largest driver could easily enter from his own side. In the tonneau, the folding seats vanish into the back of the front seat, when folded, and when unfolded, are found to be upholstered as well as the other seats and large enough for real comfort.

Acceleration Is Good

A short trial over good and bad roads close to the factory showed the car to be exceptionally well sprung, and that the acceleration on high gear was entirely up to the modern high standard. The engine is noticeably free from vibration and runs very sweetly indeed, being practically soundless except for a not unpleasing exhaust hum.

It is noteworthy that the controls are all arranged conveniently to the steering wheel and that the steering is light in action.

The History of the American Automobile Industry—7

Bullard's Steam Automobile the First Steam Vehicle to Have Automatic Control of Its Essential Functions—Very Light—Wire Wheels Used —R. E. Olds Begins Work on Steam Cars

By David Beecroft

SECOND to Lucius D. Copeland as a pioneer developer of steam motor vehicles came James H. Bullard of Springfield, Mass., who began the construction of his first steam automobile in that city in 1885. Mr. Bullard first designed a cylindrical boiler with fire tubes through it lengthwise and charcoal or anthracite fuel. At first intended to be inclined, this boiler was later sketched vertical with the engine mounted directly upon the boiler shell and driving the wheels by means of a pinion on the crankshaft meshing with the gear on the driving axle at its center. This engine mounting is interesting because used by a number of later constructors, but this design was not built by Mr. Bullard, who gave preference to a horizontal engine mounted over a horizontal boiler and placed at the rear of the driving axle. The engine had two cylinders and the driving axle was the forward one, the driver's seat being practically over this driving axle and there being two small steering wheels at the rear. The construction was begun in 1885 and continued throughout that year and most of 1886. The cylinders were slightly under 3 in. bore by about 4½ in. stroke with cranks at 90 deg. The valves were of the oscillating type and with no provision for reversing. A bevel gear differential was used and a clutch provided around this differential so that the vehicle could coast without turning the engine.

Wire Wheels Used

The driving wheels were of the wire spoked type used in bicycles at that time and about 50 in. in diameter. The rear steering wheels were also bicycle wheels of about 14-in. diameter, all fitted with solid rubber tires. The wheelbase was about 4 ft. and the gage 2½ ft. A handlebar steering controlled these rear wheels which were provided with such steering arms to make them track properly when turning corners. To avoid twisting the mechanism, the steering axle was provided with a horizontal king bolt which permitted one end of the axle to rise and fall without twisting the frame, a device that found much favor with the early inventors, who were as likely to overestimate difficulties in their inexperience as to underestimate them.

The hand wheel of the throttle valve was brought forward under the seat to a point where the operator could reach it and the brake shoes bearing on the rubber tires were applied by pedal. The seat was wide enough for a single person only.

The first experiments indicated the unsuitability of the cylindrical boiler and solid fuel so experiments were begun to develop a faster steamer and some form of liquid fuel burner. A flash boiler arranged to be kept hot by kerosene wick lamps and to instantly convert water into steam when the pump supplied the water was next tried, but without reasonable success. He next tried a porcupine type of tubular boiler holding about 1½ gal. of water, which worked well when sufficient heat was provided. The wick fire could not be forced sufficiently, so many experiments were made in the attempt to burn kerosene without smoke. Bullard persisted, however, deviating only once to try alcohol in a surface burner, but this did not give sufficient heat and the whole device caught fire. Finally the idea of atomizing the oil was tried with a small atomizer, which showed that a very hot flame free from smoke and consuming a large quantity of oil could be produced in a very small space. This discovery was followed by many weeks of experiments devoted to working out details of tanks, burners and regulating devices to the end that the supply of oil, the compressed air, the supply of water and similar necessities should be automatic, leaving the operator free to devote his attention to the road. The steam pressure regulated the amount of fire, shutting it off entirely when a certain maximum was reached, a pilot fire burning constantly being ready to light it up again when the steam fell below a certain minimum.

Automatic Control Features

This was the first steam vehicle of any kind to have automatic control of its essential functions, and patents were secured covering all the novel features. This vehicle was successfully operated in Massachusetts during the summer of 1886. The runs were all short and generally took place early in the morning in order to avoid interference with other traffic and to prevent accident, due to frightened horses. The complete vehicle was very light, being easily lifted by two men. Its maximum speed and power were not taken but it would easily

go as fast as any one cared to ride on ordinary roads of that time.

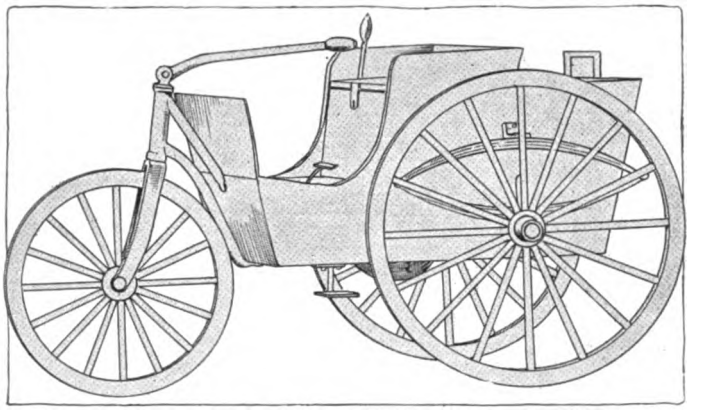
Mr. Bullard's process of burning oil was found to be adaptable to many other lines of business in which a perfectly clean fire of high temperature was necessary, and a flourishing business grew out of the method of atomizing oil by air pressure and burning it under steam boilers and in furnaces for forging, welding and melting metals in brick and pottery kilns and in glassworks, all with highly satisfactory results as to quality of product and economy of operation. Bullard took up the steam vehicle again in 1898 in connection with A. H. Overman of bicycle fame, but this later effort will be considered in a later issue.

The James H. Bullard motor vehicle patent shows a two-cylinder, horizontal steam engine, although it is not known that Bullard was aware of Copeland's work, but probably he was. The H. B. Smith vehicle, patented Feb. 26, 1889, which patent was filed about six weeks after Copeland's patent was issued, undoubtedly reflected Copeland's enthusiasm because the Smith Machine Co. were makers of the Star bicycle to which Copeland first successfully applied his motor. It is claimed that the Smith machine was completed in 1885, the patent being filed within 2 years after its completion. This machine much resembled the one shown in Copeland's patent in that it had two large rear wheels and a single front with the boiler mounted on the reach but this reach was at the side, making a two-track vehicle instead of a three-track one, as was Copeland's. No pedals were provided, which Copeland's patent showed. Both two and three-track tricycles were common in those days, so this choice has no significance.

The Smith vehicle used 48-in. rear wheels, a then common size, with 1¾-in. cushion tires and probably weighed 500 to 600 lb. The boiler was tubular and of copper, heated by fuel oil carried in the hollow frame and sprayed through a burner. The gears provided two rates of speed of 4 and 12 m.p.h., respectively, and the single-cylinder engine was able to drive the vehicle at the higher speed even on the Jersey roads which were heavy and sandy.

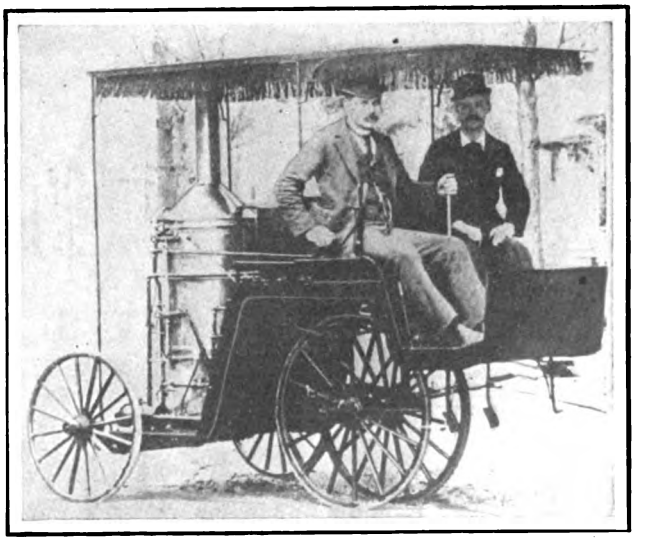
R. E. Olds Begins Experiments

Ransom E. Olds' introduction to mechanical life came at the shop in Lansing, Mich., where, with his father, he was engaged in building small portable steam engines, having started in 1880, under the name of P. A. Olds & Son. Like many others, he had the idea that the power-propelled vehicle could be a success and about 1886 or 1887 began a small three-wheel buggy driven by a little steam engine and boiler completely inclosed in the enlarged buggy box on the front part of which the seat was perched. The single front wheel was carried in forks like a bicycle wheel and steered by a tiller lever. The only picture extant is probably a drawing produced from memory and does not give essential details. As first made, the variable lever and ratchet drive was employed but as this transmits the power by a series of very disagreeable jerks, it was abandoned and later chains and gears were tried. The wheels were steel tired and about 4 ft. in diameter which was the usual carriage size. As rebuilt, a clutch was provided to disconnect the engine from the wheels, the seat was wide enough for three and the weight about 1500 lb., or somewhat heavier than the little steamers so common 15 years later. It could run as much as 10 m.p.h., but was quite noisy and was usually operated on the streets of Lansing in the latter part of 1887 about 3 or 4 o'clock in the morning before other street users were about, to avoid frightening horses. So little promise did this machine hold forth that it was dismantled and the matter dropped for several years.



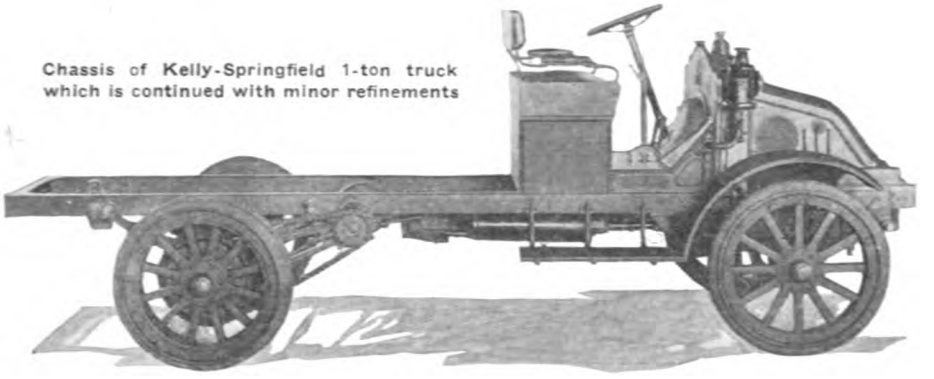
Three-wheel steam buggy designed and built by R. E. Olds in 1886 or 1887. The engine and boiler were inclosed in the buggy box on the front of which the seat is located

About 1890, using the former rear wheels and axle, Olds again attacked the problem. This attempt was actually running before May, 1892. It had a vertical boiler, carried on a low, rear platform so as to not project too high, while the passengers were seated in front of the boiler and over the front wheels, which were double but placed so close together as to steer like a single wheel. This vehicle, evidently, was the subject of considerable changing and experimenting and was eventually sold to go to Bombay, India.



R. E. Olds in his second steam car built about 1890. Note the double front wheel steer. The same rear wheels and axle were used in his first design

Kelly Line Increased To Seven



Chassis of Kelly-Springfield 1-ton truck which is continued with minor refinements

Models Added Have Capacities of 1½, 2, 4 and 6 Tons— Minor Refinements Also Made

SEVEN models make up the 1916 line of Kelly motor trucks manufactured by the Kelly-Springfield Motor Truck Co., of Springfield, Ohio. These trucks are known as K-30, K-31, K-35, K-40, K-45, K-50 and K-60. Of these, K-31, K-35, K-45 and K-60 are new. With the exception of the additions no marked changes have been made in the policy of this concern for this season. At the same time, a number of improvements and refinements of a minor nature have been incorporated.

Two Motors Used

Following the practice of a year ago, two motors are used. A smaller size known as the K-30 is used in the 1, 1½ and 2-ton models which are known respectively as K-30, K-31 and K-35. The larger model is known as the K-40 and is used in the 3½, 4, 5 and 6-ton chassis which are named in accordance with the respective lettering given above.

The improvements include a new carbureter which is now the latest Rayfield, in place of the design formerly used. Another improvement in the motor consists of the lower half of the crankcase being cast in two seperate pieces with the bottom part forming an oil reservoir of 2.75 gal. capacity. This is covered entirely with a screen which allows a straining area of approximately 2500 in. Beyond these, no noticeable alterations in mechanical features have been made.

The small motor known as the K-30 is a 3¾ by 5¼, L-head block design, with the valves on the right side and inclosed. The larger motor is a T-head design cast in pairs with a bore and stroke of 4½ to 6½, with a nominal rating of 40 hp. The S. A. E. ratings of the two motors are respectively 22.5 and 32.4 horsepower.

Oil System Partly Revamped

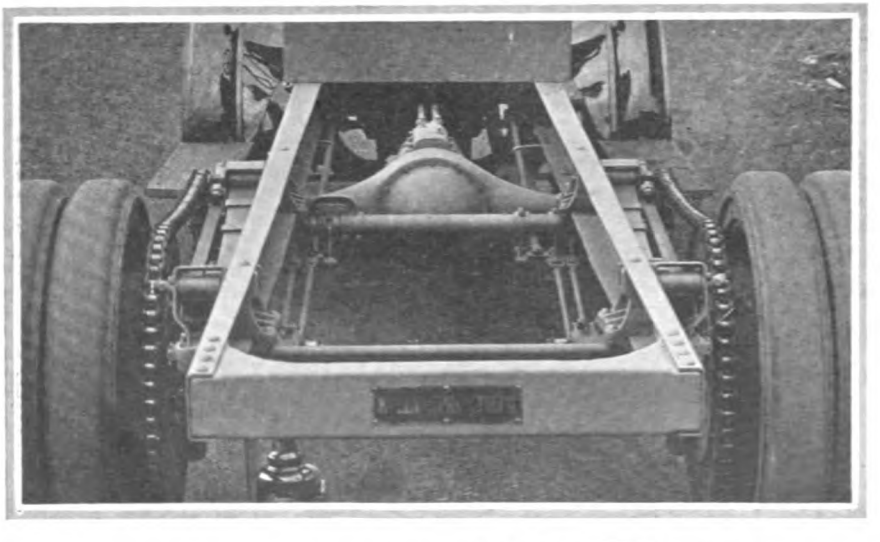
While part of the oiling system of these motors has been revamped, as explained it is still practice to keep the oil pump in the bottom of the reservoir in such a location as to secure only strained oil. The crankshaft of the motor is hollow as it was last year and the oil is forced through this to the lower connecting-rod bearings.

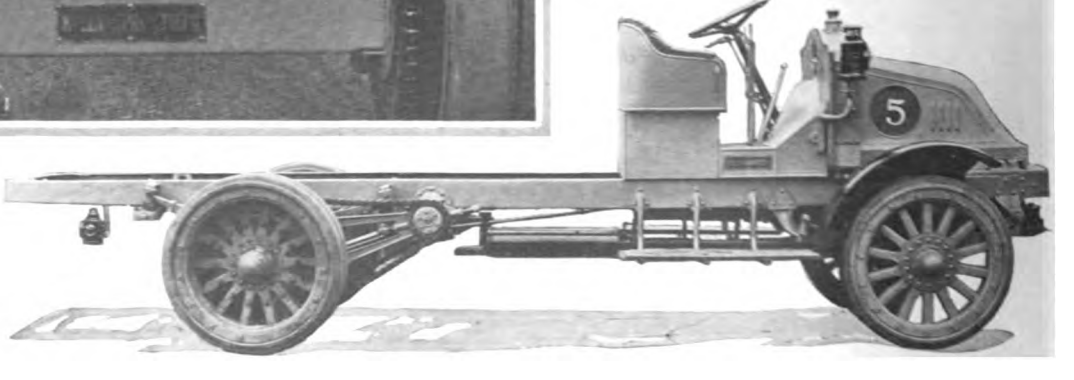
Final Drive by Chain

Power is taken from the motor by a cone clutch to a three-speed selective gearbox located amidship. Final drive is by double chain to the rear wheels. The springs are semi-elliptic, front and rear. The lower end of the drop-forged radius rod is forged to the brake spider, the forward end being held by means of an adjustable radius-rod block to the ball end of the jackshaft housing. With this construction the braking strain is thrown upon the radius rod which is especially designed to take up the strain of braking torque. With this system of construction there are no rigid cross members, the frame being allowed to absorb the strains and shocks.

Radiator Mounted on Springs

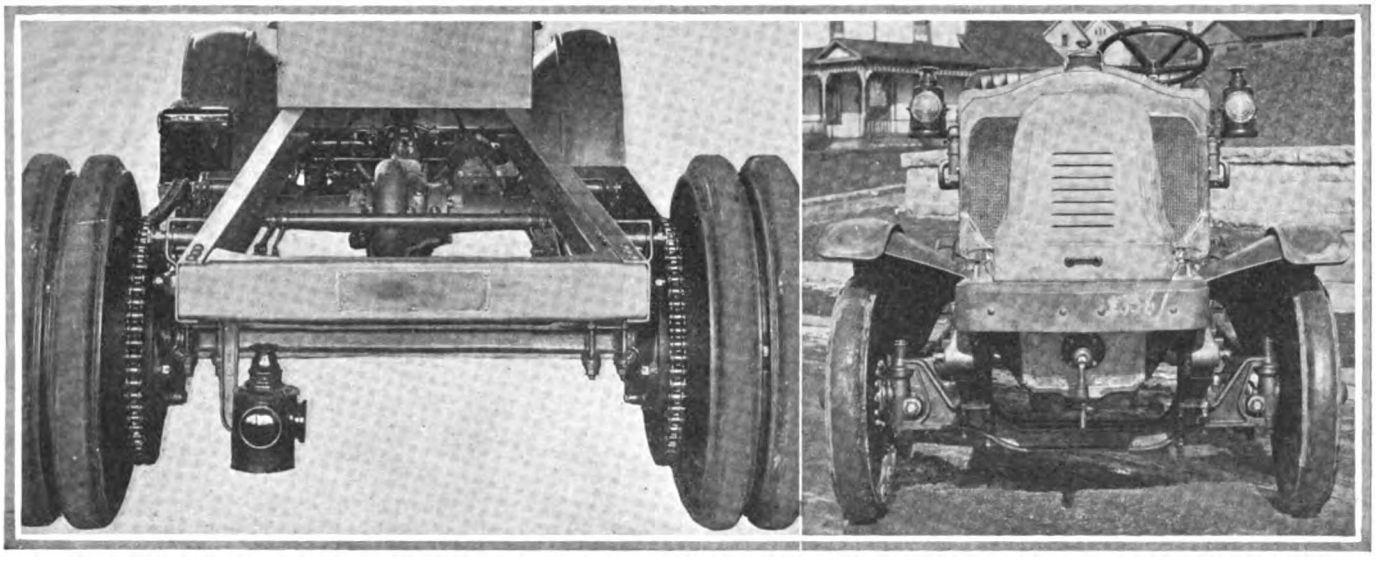
One of the distinctive features of the Kelly truck is in the mounting of the radiator which is behind the motor and in front of the dash, although independent of the dash. It is carried on four sets of springs which are allowed full freedom of





Above — Rear of the Kelly-Springfield 5-ton truck showing the drive and suspension units

Right—Chassis of Kelly Springfield 5-ton truck



Left—New K-35 2-ton Kelly-Springfield chassis which has been added to the line this year. Right—Front view of Kelly-Springfield chassis showing typical bonnet and radiator appearance

movement and absorbs the road shocks before they reach the radiator. The prices of the seven trucks are as follows: K-30, 1-ton, $2,000; K-31, 1½-ton, -2,050; K-35, 2-ton, $2,750; K-40, 3½-ton, $3,400; K-45, 4-ton, $3,600; K-50, 5-ton, $4,250, and K-60, 6-ton, $4,500.

Different types of bodies are interchangeable on the same chassis size, thereby rendering it possible for the owner of one of these trucks to have a vehicle suitable for many different kinds of work. The body equipment is as complete as on the models on the market for the past year.

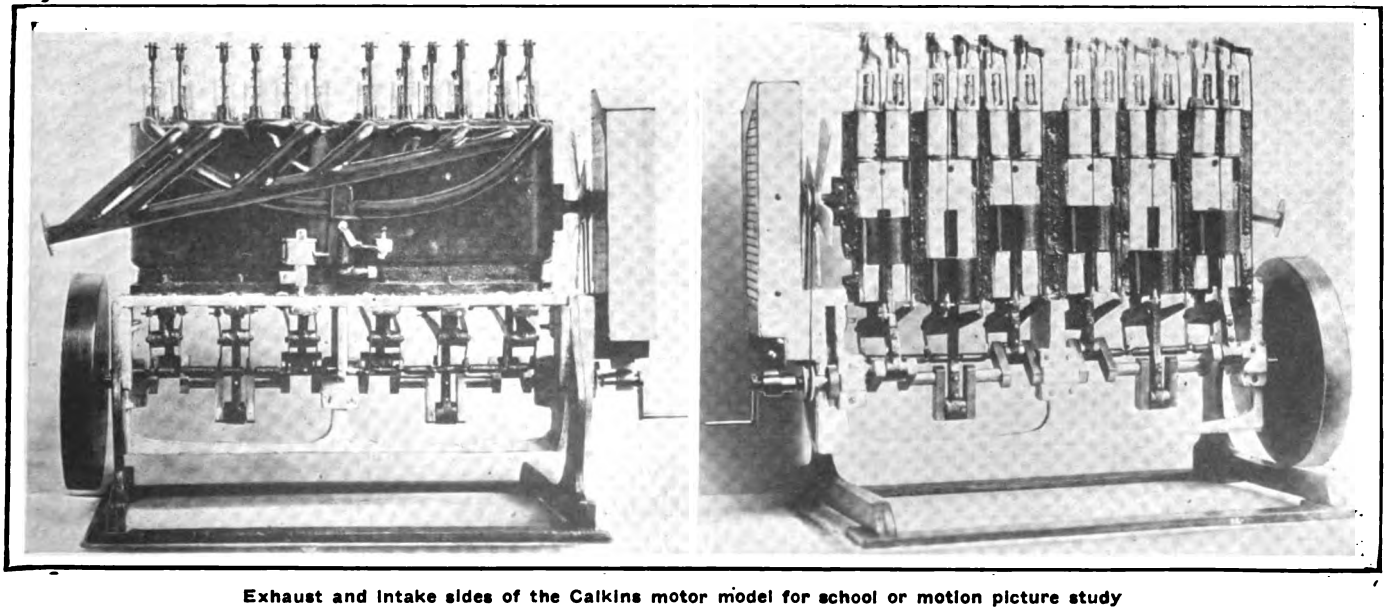
Model for School or Motion Picture Study

IN order to provide an instructor's model at low cost, A. B. Calkins, a mechanical engineer of New York City, has brought out a series of longitudinal motor section models made of low-priced materials such as wood, etc. This series of models, while light, are of sufficient sturdiness to withstand the ordinary usage of the classroom and at the same time can be operated by a small hand crank in such a manner as to show the operation and functioning of the various elements of the motor.

It is common practice in most of the motor schools to employ cut models showing the working parts of different types of motors. To cut these models from the materials used in actual motor manufacture is an expensive undertaking, and hence the use of the model has been more or less restricted. With the Calkins model the objection of great expenditure is overcome and at the same time it is quite feasible to make all the working parts of the motor visible by using a complete cut longitudinal section.

The accompanying illustration shows a model of this description which is to be put on the market especially for automobile schools. The particular model shown is a six-cylinder, four-cycle design with overhead valves. A magneto timing gear is furnished with this model and along with the model is a short treatise on power calculations.

Another use for models of this type is the taking of motion picture films, and it is one of the inventor's ideas that technical schools can be supplied with reels suitable for the lecture room for any discussion of the action of a motor.



Exhaust and intake sides of the Calkins motor model for school or motion picture study

Protecting Finish Prolongs Car Life

Good Paint and Varnish Essential—Must Be Skillfully Applied—Good Materials and Workmanship Real Economy—Getting a High Polish—The Dull Finish

By M. C. Hillick

WORKING in co-operation with steel, aluminum, wood and such other things as are usually squeezed into the make-up of the automobile, good paint and varnish confer the lion's share of benefit upon the vehicle. The metal may be rough, and in its undressed state far from a thing of beauty, but under the magical effect of paint and varnish it becomes transformed into something good to see. While the appearance of the car is rounded out, and the grace of the fashion of it emphasized by the application of suitable colors, and the employment of a mirror-like finish, the real mission of the painter's work is to furnish the last full measure of protection to the surface of the car.

The extent of that protection, then, rests primarily upon the quality of the materials entering into the finish. By whatever margin the protection falls short of what it, in all fairness, ought to be, by that margin the quality of the paint and varnish mediums fails to meet a right standard of requirements. In this quality—this superior brand of excellence—the car owner, first of all, should have a deep-rooted interest.

Economy to Pay for Good Materials

It is economy to pay for the use of such materials for at least two reasons. First, they wear enough longer, and furnish the needed protection while wearing, to more than equalize the difference in cost between superior and inferior stock. Second, the car is shopped less frequently, thus furnishing more protracted and more efficient service, and less overhead expense, due to idleness in the shop.

Then there is the additional advantage—shall we not say additional profit?—derived from the finer appearance, the more luxurious appointments, which are part and parcel of the practice of using a class of paint and varnish stock strictly above suspicion. A high grade of material is not all, however. United with it—an indivisible part of it, in fact—must be an equally high grade of workmanship. The finest paint or varnish to be found anywhere counts little if applied by an incompetent workman. All the value combined in its make-up by the most scientifically adjusted methods of manufacture go for naught when the craft muddlers lay unskilled hands upon it.

Up to the Car Owner

It is, of course, the business of the painter to see, among other matters, that good materials and workmanship are furnished. Nevertheless, this is not always done—or, at any rate, not nearly so well done—unless the car owner evinces an interest in, and a knowledge of, the painting system employed and its possibilities for furnishing a finish for which no apologies will be required.

In the purchase of clothes and of motoring necessities in general the average car owner is both fastidious and exacting. Why not in buying what the painter has to sell insist upon an article of uniform excellence?

It adds substantially to your motoring pleasure and comfort. Moreover, it adds to the life of the car and thus indirectly serves your bank account a good turn. A recent article in THE AUTOMOBILE has stated, in effect, that the improvements which have lately been made in the manufacture of sheet steel are of such a nature that the metal is more subject to corrosion than formerly. This condition, therefore, makes the need of regular, systematic painting and varnishing, performed decently and in order, increasingly urgent.

Lacking the necessary protection the parts of the car often most in need of it become exposed to the weather, and corrosion immediately begins to gnaw at the vitals of the finish.

Rust Ruins Many Cars

A well-known automobile engineer has said that more cars are every day going to the scrap heap through destruction by rust and corrosion than from any other cause. The weakness and decay of metal through the action of rust and corrosion are becoming widely recognized.

To such an extent is the damage resulting from these agencies feared by railroads which within recent years have become large owners of steel passenger cars that special instructions have been issued to keep every fraction of metal well coated with paint specially adapted to steel protective purposes.

Clean and Varnish Twice a Year

The automobile in regular use should be cleaned up and varnished at least twice a year.

The word varnish does not exactly convey the meaning of the labor involved. Before applying the varnish the car will need to be cleaned up carefully, both body and chassis. Remove all grease and lightly rub the surface of the car body with pumice stone, flour and water. This practice gets away with any lingering traces of grease or foreign substances, and puts the film of old varnish in a receptive condition. Next, all defects in the finish, all blemishes of the color, and surface disfigurements in general, need to be touched over lightly and thoroughly with color matched to meet that upon the car.

This work calls for skillful brush use and good judgment. The match color under the most favorable conditions, and produced by a colorist of the best type, will fail possibly a trifle in being precisely the same shade as the old, for which reason the least used the better. In touching up, the painter may well be admonished to cover no surface beyond the actual defect. This touching up had best be done with a small lettering or striping pencil so that not only a very small quantity of color is used but that rough, coarse edges may be avoided.

Varnish Will Not Conceal Splotches

Thick splotches of color cannot be successfully concealed under one or two coats of varnish, or for that matter, under any number of coats, so the essential thing to do is to apply

the color sparingly and with a satiny smoothness. All this makes for the best possible sort of finish.

A New Coat of Color

Frequently the finish is in comparatively good condition but with the color showing such a faded, disfigured condition that the only means of restoration consists in giving the entire surface a coat of color, running the ornamental lines over this, and then in due time applying the coat of finishing varnish. In many cases this process is practically as quick as the touching-up method, and scarcely more expensive. In the matter of appearance and finish it is in every way superior to the touch up and varnish practice, this latter feature being the one that, above all others, really commends itself to the car owner. There are many things connected with this touch up and varnish, or the one coat color and one coat varnish job, which the car owner should not let the painter forget.

Radiator Needs New Paint

The radiator, for example, should always get a fresh smear of paint. A thin, tough coat of paint—one that under heat holds its luster and shines on with the tenacity of a new moon. The fenders need to be finished with a hard drying finishing varnish. All defects, and parts which do not compare favorably with their surroundings, or with the finish in general, should be touched up with the proper color, or with varnish color, in a way to enhance the finish and balance the appearance of the car up to something approximating that given the best class of work.

Clean the Natural Wood

Not a few automobiles are being let out of the shop with the natural wood finish on the inside of the cars soiled and darkened to a condition detrimental to the appearance of the interior appointments. Wherever the finish is thus found the varnish should be taken off either with paste varnish remover or with steel scrapers, completing the operation by sandpapering with No. 1 sandpaper. Then apply a solution of oxalic acid which in the course of a few minutes will bleach the wood and restore its original color effects. Then rinse off with clean water and follow the evaporation of the moisture by a thorough sandpapering. Next proceed to fill the wood with a good mineral filler colored to meet surface requirements. Let the filler, after application, dry for 24 hr., and then apply two coats of orange gum shellac, sandpapering each coat carefully. A couple of coats of rubbing varnish, and one coat of finishing varnish, will then restore the natural wood finish to its proper sphere in the general finish of the car interior.

Some parts of the interior of the car, if not all, had best be given a rubbed and slightly polished finish. Door casings, door edges, stiles, and such other parts as are subject to considerable handling, will present a much finer appearance if so finished. All these parts are to be brought through with the necessary coats of rubbing varnish. The final coat should be a good grade of polishing varnish, freely applied.

Finishing Up the Surface

In due time rub this coat with pulverized pumice stone and water, then with rotten stone and sweet or crude oil, after which go over the surface with the palm of the hand, rubbing smartly until under the friction so generated a moderate polish is developed.

For a Higher Polish

In the event of a higher, brighter polish being desired, the surface after rubbing with oil and rotten stone may be polished by using a tuft of cotton or tow dipped in some approved make of varnish polish. The polish is a result of friction and this friction can best be developed by holding the tow or cotton in one shape until it becomes matted down and saturated with the polishing material to such an extent that in working it back and forth across the surface a sharp creaking sound is made.

A surface finished with this class of polish can be handled with impunity, and without leaving any visible signs of being "mussed up." For the closed cars in which it is desired to create an effect of real elegance coupled with creature comforts, with such effects to be maintained at their best at a minimum cost, the rubbed and polished finish offers advantages quite out of the ordinary.

The Interior Finish

More attention is being paid to the finish on the interior of the car, and to all interior appointments, than ever before. The rubbed finish either in the popular dull effect, or in the full polish luster, furnishes a maximum of value at a minimum maintenance cost, and confers the luxury of the drawing room upon the interior of the car.

The Dull Finish

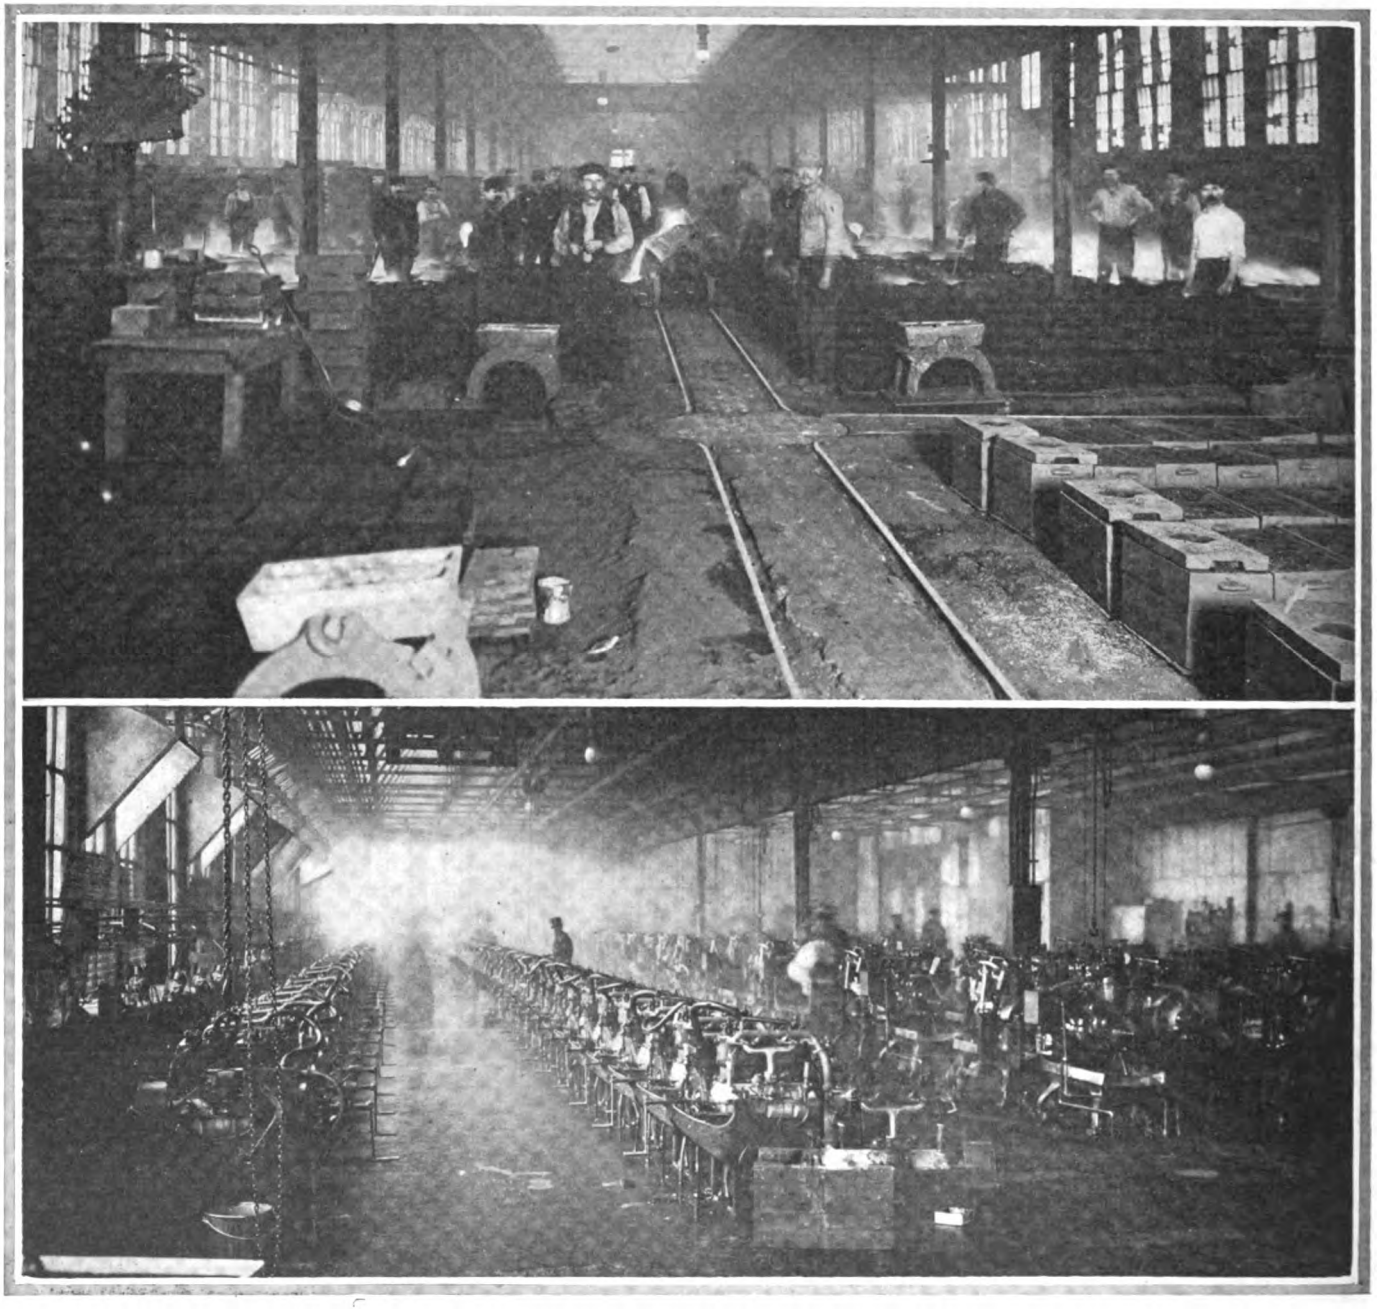
What has been stated with reference to the dull finish for the car finish applies also to the exterior. Everywhere the dull or "no-luster" finish is being exploited. This finish is being in some cases—in many cases, perhaps we should say—developed through the employment of enamel or flat drying paints. The best and most durable dull finish, however, is produced by bringing the exterior body surface up with the usual quota of varnish coats, and then rubbing the finishing coat to a dead, or an eggshell gloss effect.

Dart Makes Special Jitney Body

A SPECIALLY designed jitney bus body has been mounted on the Dart model C 144-in. wheelbase chassis. The chassis alone lists at $1,800 and a body 140 in. long at $750. The body is richly upholstered throughout and has push buttons as signals for the driver and dome lights. It is lighted from a Westinghouse generator and storage battery. The motor used on this car is a Buda 4⅛ by 5½ four-cylinder.

Another jitney bus built as a ten-passenger body fitted for any of the Dart chassis is shown herewith. This is known as model A and has the seats running lengthwise and the machine equipped with top and curtains for bad weather. This style car sells for $1,000 on the model A chassis, model B fourteen-passenger, sells for $1,633 and model C, eighteen passenger $2,105. The seats may be removed and the cars transformed into livery rigs in 5 min.

First and Last Stages in the Building of Buick Motors



THE factories of the Buick Motor Car Co., in Flint, Mich., are ever a source of interest to the visitor. In the views above are illustrated two vistas in the big factories, the upper showing metal being poured into the waiting moulds in the foundry department, and the lower giving some idea of what it means to test enough motors to take care of a 42,000 automobile output.

The motor casting part of the Buick factories is a building 526 feet by 80 feet, making an available floorspace of 1 1-2 acres. Nine million dollars is the sum annually expended in the payroll of the casting department which employs between 325 and 350 men in the making of all sorts of castings which go into the makeup of the car. The work of the department is not confined to iron castings, as it also makes aluminum gearcases, crankcases, etc., as well as iron cylinders, pistons and the like.

The motor testing department is always an interesting feature of an automobile factory. It impresses tne observer as being peculiarly indicative of the feverish activity of the whole plant. Here is concentrated all the power which many other departments are storing up, so to speak, as they add each part to the embryo motors. The Buick motor test room contains 200 test stands and there are complete facilities for putting each engine through its paces to the satisfaction of the inspectors. All adjustments are made and the power plant tuned up to its maximum productive pitch before it passes inspection and goes out into the world to rely upon its own powers.

The motor plant is 782 feet long by 360 feet wide, and is said to be the largest in the world devoted exclusively to construction of automobile engines. It covers 6.46 acres and in it the engines grow from a miscellaneous collection of parts to the finished state ready for transference to another building where they meet the chassis. The motor machine shop in this building contains 683 machine tools, representing an outlay of $800,000, and employs an average of 1,400 men. It can turn out 250 motors a day.

Data on Mixed Motor Fuels of Interest for American Export Trade

¶ *Under this title the first portion of Baron Von Loew's road tests with fuels composed mainly of benzol and alcohol in different proportions was printed in* THE AUTOMOBILE *of Oct. 14, and the importance of these tests for the American industry was explained. The following additional report amplifies these data, and a third report is still to come in which the author will account for the improved acceleration obtained with pure alcohol or fuels very rich in alcohol by narrowing the air channel around the jet of the carbureter.*

Other data very closely connected with the same subject were furnished in THE AUTOMOBILE *of Aug. 12 under the title:* "Car and Carbureter Design Suitable for Driving with Any Fuel" *and in the issues of July 29 and Aug. 5 under the title:* "Analysis and Valuation of Motor Fuels—14 Methods of Examining Them."

No material of equal value to the automobile industry and automobile owners on the subject of motor fuels in its relation to motor design has been collected anywhere else. It gives clues to a desirable independence of the petroleum supply not only in a hazy future but at almost any time when technical and active organization for that purpose is undertaken, and it opens extensive possibilities for a larger trade in automobiles in all those tropical regions of the earth which are now developing so fast industrially but where gasoline can never be as desirable a fuel as hydrocarbons of lesser volatility provided these are made suitable for use on equal terms of efficiency and convenience. Careful reading of the articles referred to will disclose their relations to American business and business prospects with such detail, precision and anticipation of objections as cannot be conveyed in a few general words. The problems still involved have advenced toward their final solution in a much more definite and practical manner than those relating to the application of the Diesel system to motors of light weight—which represents the only competing possibility in sight for gaining independence of the petroleum market and of the very considerable fluctuations in the composition of the available crude petroleums. The exclusion of Mexican wells from the market supply, for example, is even at this moment held accountable for a rise in gasoline prices, less by reason of the quantity excluded than on account of the less suitable composition for gasoline distillation of other raw materials, just as Russian petroleum has so far been effectually barred by its large hydrogen content. While not yet as pressing as in Germany, the interests to which these data relate in the United States do not, therefore, belong to a remote future but may at any time assume the greatest practical importance. Motors suitable for being operated with any fuel from pure gasoline to pure alcohol or kerosene may be in strong demand in two or three years not only for export but even for the domestic automobile trade.—M. C. K.

Please correct typographical error on page 711, issue of October 14. Under Table 10 read: "Hill-climbing trial-runs with ½ liter of fuel" instead of: "Hill-climbing trial-runs with ⅓ liter of fuel."

Driving Tests with Benzol-Alcohol Mixtures by Baron Von Loew—II

IN tables presented in the first parts of this report the capacity of the test car for acceleration and for sustained pulling with different fuels and with the motor developing its maximum of power has been shown for two different road formations and in the variations to which it is subject. Similar speed trials and comparisons have been made in numerous other places, and some of them throw special light on the fuel values. Details are given in the following.

For many tests it is of special interest to have them carried through with the motor working at the limit of its power. With my test car (Horch car, Audi works, 4 cylinders, 90 millimeter bore and 140 millimeter stroke, weight 1356 kilograms) this condition cannot be realized in practice except on a very steep road with little traffic, as on ordinary grades it easily reaches speeds which interfere with the traffic and therefore cannot be sustained. For this reason, as already mentioned in the previous account, the longest and most decisive tests at maximum motor power were made only on the steep road from Wiesbaden to Hohe Wurzel, the profile of which is given in the accompany illustration. As also mentioned, the first trials were made with 1 liter of fuel and began at kilometer-stone 3.9, while the later trials were made with only ½ liter of fuel and began at kilometer-stone 5.5. The most suitable places for comparing the speeds obtained under different fuel conditions are at kilometer-stone 6.5, the shortly before kilometer-stone 6.8, the exact place corresponding to about 6.75. On account of the gentler gradient after the 6.3 stone the speedometer registers highest at stone 6.5, and thereafter it drops at once rapidly, until shortly before stone 6.8 it is at its lowest. After this point the grade of the road is easier and the speedometer hand rises again. At the ½-liter trials previously mentioned the fuel often gave out before point 6.75 was reached, and any publication of the speed figures obtained could therefore only have been fragmentary. Other trials were therefore made, on Aug. 9 and 10, which began higher up. Those on Aug. 9 began at stone 6 and those on Aug. 10 at stone 5.8. The reason for going back from 6 to 5.8 illustrates the compromises that must be made for tests of this kind in practice. It was as follows: When starting at stone 6 the stronger fuel mixtures would carry the car far beyond stone 7, and here the road is much less steep than further below, which would make the comparisons of fuel consumption appear more favorable for the stronger mixtures than it really is. To avoid this flat upper stretch, which was reached only by the very strongest fuels, the start of the runs was thus laid back, not to 5.5 but to 5.8. The perfectly ideal test road can of course never be found, and in comparing the figures obtained one will always have to make some allowances for the peculiarities in the conditions.

Table 1 shows the results of the runs made on Aug. 9. They were made on a warm and bright day between 11.30 a. m. and 1.30 p. m., the thermometer registering about 25 deg. C. The runs shown in Table 2 are those made on Aug. 10, when it was still warm but cloudy with occasional

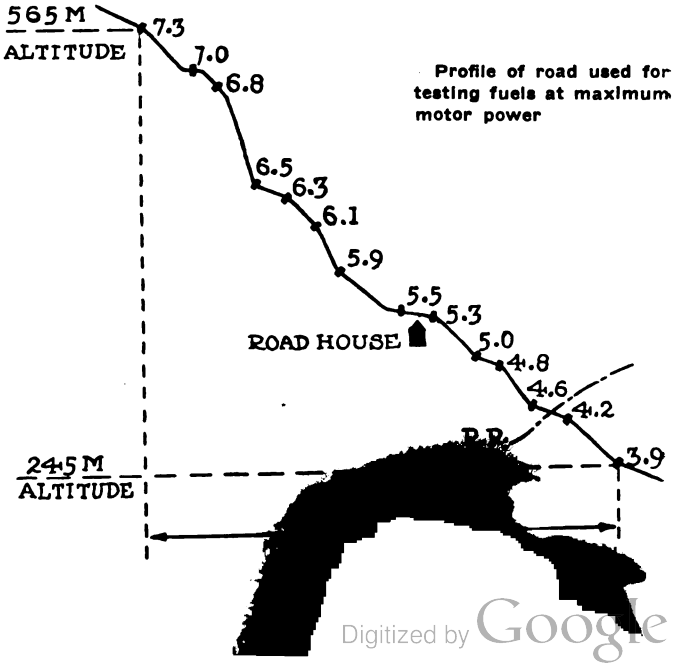


TABLE 1

Fuel, ½ liter	*Km.-stone* From To	*High Speed* Kw.-hr.	*Low Speed* Kw.-hr.
1 benzol + 5 alcohol	6.0 — 7.115	28 III	22 II
1 " + 3 "	6.0 — 7.27	34 III	24 II
1 " + 1 "	6.0 — 7.41	40 III	24 III
1 benz. + 1 kero. + 1 alc.	6.0 — 7.475	42 III	28 III
1 b. + 2 kero. + 1½ alc.	6.0 — 7.43	43 III	29 III

The Roman figure after the car speeds indicates the gear used when the car speed was recorded.

TABLE 2

Fuel, ½ liter	*Km.-stone* From To	*High Speed* Kw.-hr.	*Low Speed* Kw.-hr.
1 benzol + 5 alcohol	5.8 — 6.83	30 III	24 II
1 " + 4 "	5.8 — 6.86	30 III	25 II

Pure benzol	5.8 — 7.26	40 III	24 III
Pure gasoline	5.8 — 7.15	40 III	24 III
1 benz. + 1 kero. + 1 alc.	5.8 — 7.12	40 III	17 III

light rain. In Table 2 the equal mixture of benzol and alcohol appears again more favorable than benzol alone, as on many previous occasions. In the column for lowest speeds in Table 2 it is interesting to note that the speeds reached on second gear as a rule are higher than those reached on third gear, and this is explained by the fact that at this steepest place in the road the motor speed became quite low on the third gear, in order to avoid a gear change. With the more alcoholic mixtures the change from third to second speed became necessary long before the steepest spot was reached. With the 1-to-2 mixture it was very questionable whether the third speed would have pulled through, as the speedometer had fallen to 5 kilometers per hour causing me to change and drive the last 20 meters on the second. The ability to drive on the third gear at such a low speed in this place, where the gradient is about 1 to 8, is characteristic of the sustained pull obtained with the alcohol and benzol fuels. With gasoline a similar drop of the car speed would be entirely out of the question; there would be first considerable clicking and knocking of the mechanism and, unless the gear were changed, the car would soon jerk a little and stop. German drivers have now become accustomed to this excellent quality of benzol and alcohol and accept it unthinkingly as a matter of course. But, if we were to return to gasoline, we would often be astonished at the motor's ready tendency to knocking, which has now almost been forgotten. [The author is speaking of the modern European motor with long stroke and a speed of about 3000 r.p.m., and it is only for motors of this type that his data on the efficiency of the fuel mixtures hold good.]

The runs made on August 10 and represented in Table 2 mark the close for the present of my tests of benzol-alcohol mixtures with a carbureter adjusted for gasoline and with the particular car employed. This car has during one year been driven about 3000 kilometers with benzol-alcohol mixtures. No injurious influences were experienced. The mixed fuels were found cheaper, for a given amount of road work, than unmixed ones, at the prevailing prices. As shown in numerous tables, the power efficiency of the mixed fuels was not always inferior, comparing volumes or weights, and where inferiority was shown it was usually slight. With the strongly alcoholic mixtures the difficulty arose on cool days that it was inadvisable to load the motor down suddenly; on approaching a rise in the road gradient the throttle had to be opened gradually in order to keep the motor warm enough. But it may be said at once that this difficulty can be almost overcome, as the motor worked well with unheated mixtures rich in alcohol and with clear alcohol after the area of the air channel around the jet in the carbureter had been contracted. The trials made with the carbureter modified in this manner remain to be accounted for, but they have not yet been quite brought to a close. I have already reached the viewpoint, however, that it is more than a mere trade puff when some makers of motors and of carbureters contend that their productions work just as well with alcohol as with gasoline. On the very first run of my own series of trials with a contracted carbureter I attained almost exactly the same power efficiency as previously with gasoline and a carbureter of normal section. The fuel consumption is also much more moderate than assumed at most automobile factories. It is regrettable that evidently very few know what an excellent fuel alcohol is for motor vehicles. The smaller heat value of alcohol is balanced, so far as power efficiency is concerned, by its smaller need of air for combustion, which permits us to burn a much larger quantity of alcohol in a given time in our automobile motors than we can burn of gasoline or benzol.

The principal trouble with alcohol as an automobile fuel arises through the rapid variations of the motor load. On long trips over level roads the motor becomes so cold that it is hard to make it pull for a hill, but numerous expedients are at disposal (see THE AUTOMOBILE for August 12, page 289) for heating the intake channel and completely overcoming this drawback.

Facts About Rust and Its Formation

WHILE everybody knows considerable about rust, few know enough for practical purposes, and some of the facts which have been observed in connection with the formation of rust under unusual circumstances are still only partly explained by science. To enable owners of automobiles to protect their vehicles against the inroads of rust with a better understanding of the task than that usually possessed outside of the chemical profession, Dr. P. Martell gives in *Auto-Technik* a line of information on this subject which covers the ground in a practical manner and which is reproduced in part in the following.

Chemically, rust is a combination of metallic iron with oxygen and water. In 100 grams of dried iron rust the proportion is about 52.3 grams of iron, 22 grams of oxygen and 25.7 grams of water. The water is chemically combined, not free. It is permissible to conclude from this composition of rust that is can only be formed when iron comes in contact with both oxygen and water. And practice confirms this conclusion, showing that, if either oxygen or water is absent, no rust is formed. Iron remains free from rust, for example, in water which contains no oxygen. Also, steel and iron can be protected almost completely, if there is placed in the room where the metal is kept a quantity of chloride of calcium, which draws all water out of the air in the room.

Oxygen alone, as said, does not attack iron at ordinary temperatures. Fine steel instruments can be easily protected by taking advantage of this fact. To this end a layer of dry chloride of calcium is placed in the bottom of a glass vessel which can be closed by an airtight cover and the instruments are placed upon, or suspended from, an intermediate and perforated wood or cardboard cover plate secured in the vessel, after first dipping the instruments in alcohol to remove traces of water. Ordinary atmospheric air, containing free oxygen and usually a considerable admixture of water vapors, is of course strongly rust-forming, and the same applies to all organic and inorganic acids, even the weakest, to all chlorides of metals and alkalies and to all salts which

are hygroscopic or rich in water. Spring, well and rain water cause rust quickly, but if it is boiled first, so as to drive out the oxygen it contains, iron immersed in it will not begin to rust until the water gets a chance of absorb oxygen from the atmosphere again.

Cold water causes rust more easily than hot, because it contains more oxygen. Rain water is particularly injurious because it has absorbed a great deal of oxygen while passing through the atmosphere. The active agent in rust formation may be said to be a solution of oxygen in water. But carbonic acid also plays a certain part, being constantly produced as the rusting process continues. One of the main questions is now: How and why does rust go on forming after a layer of it has once appeared? In the case of zinc and lead, when it is exposed to air, a thin skin of metallic oxide is formed which remains unchanged and protects the metal under it against all further change. The first layer of iron rust, on the other hand, forms a porous mass which continues to admit oxygen, while it attracts liquids, especially water, by precipitation as well as by capillary action. For this reason the contention that rust produces rust is justified. To be sure, it is not truly the rust which produces more rust, but its porous nature supplies the condition for additional formation. If old or new rust is kept free from water no increase takes place.

A notable phenomenon in iron which is rusting is the marked increase of volume. This is sometimes of special importance, as the expansion takes place with considerable force and has been known, for example, to drive big building stones apart which had been set with iron clamps in mortar. It might similarly, through rust formation between spring leaves, cause the stripping of spring clip nuts in an automobile. Plaster of Paris also has an unfavorable rust-forming effect on iron inclosed therein. Pure cement, on the contrary, furnishes an active protection, even when used as a mere paint.

Science has not yet given sufficient explanation for the fact that the rust formation on an iron surface takes place in unequal degree, though the atmospheric conditions are the same for the whole surface. It is ascribed to the variations in the metallographic structure of the iron, porous spots being most exposed, and this agrees with the observation that the vicinity of fissures is always most strongly attacked, and also with the comparative immunity of the dense alloys of iron formed with nickel and chromium.

Muriatic acid and common salt generate rust quickly by contact, and if sheet iron shows small almost invisible holes this effect can with certainty be ascribed to acids. Paper, as used for wrapping purposes, usually affords an excellent rust protection.

The coloring of rust varies greatly. Fresh rust is usually a bright yellow, changing with age into brown and almost to black, but the change of color does not always take place. When rust occurs as a fine powder it is mostly yellowish-red, like the iron oxide found in nature. The porous character of rust renders it possible to soften it by making it absorb kerosene, whereafter it can be rubbed off with sandpaper, pumice or emery.

In practice the means for keeping rust away are more important than those for removing it. These means may be intended to be temporary or permanent and are classified accordingly. Reference to the permanent means—enameling, galvanizing and electroplating, chemical browning and blacking, etc.—may here be entirely omitted, but a few facts may be mentioned with regard to temporary protection, these being applicable to a considerable extent when a car is laid up for the winter months or longer. To protect small iron objects for some length of time, a quick-drying solution of rosin, an alcoholic lacquer or a solution of celluloid is much more effective than mere oiling or coating with graphite, which however are sufficient for short periods if the atmosphere is kept dry with chloride of calcium.

Where oil paint can be used it is well worth remembering that its protecting effect is much more lasting if the paint is dried artificially at a temperature of 50 to 60 deg. C. Before any painting is applied all previously existing rust should be removed, as no means has been found for preventing a rust spot from spreading and deepening under a coating. The more varnish a paint contains the more protection against rust does it afford. If a coating of oil is first removed from an iron surface, as it always should be, before a more permanent coating is applied, great care must be taken that this removal is complete, as otherwise the more permanent coating will adhere and cover only very imperfectly.

Utility Tractor Is Four-Wheel-Drive Design

Utility Steel Tractor brought out by the company of the same name in Antigo, Wis., recently. It is a four-wheel drive arrangement steering with both axles. The engine used is a four-cylinder heavy-duty governor type which has three speeds forward and one reverse. The gearset is so designed that when the engine is working under load, such as pulling four or five plows, it is direct-connected. The power is not transmitted at this time to any intermediate gears. From this condition there is a step up in speed and also a step down as well, providing either more power or more speed as desired. In the way of material, all the castings are of steel, the gears of alloy steel with hardened and ground teeth, and the bearings are Timken rollers. The wheelbase is 8 ft. and the overall length 12 ft. 6 in., the width being 6 ft. 6 in.

Two sizes of tractors are built, the large one weighing 7500 lb. and the smaller 5500. The large size is capable of pulling four or five 14-in. plows and the small size three or four 14-in. plows.

The Rostrum

Heat a Factor in Valve Clearance

EDITOR THE AUTOMOBILE:—Please publish proper clearance between valve stem and valve stem guides on a T-head motor and whether or not the clearance on the exhaust and intake sides should be the same.

My car has developed hard starting and constant missing at low speed. Upon investigation we find abnormal clearance between valve stem and valve stem guide on intake side, and expect to ream the guides to fit new valves. Will this overcome our difficulty?

Bridgeport, Conn. S. L. B.

—The amount of clearance between your valve stems and valve guides will depend upon how efficacious the cooling system is. A car which is amply cooled requires less clearance in parts likely to expand than one which is inadequately cooled. A clearance of 0.004 in. will not be too much where the parts are subjected to high temperatures. It might be best to try a clearance of 0.002 in. and gradually enlarge it if necessary by lapping in the valve stems.

New Motor Will Give Higher Speed

Editor THE AUTOMOBILE:—I desire to refinish and repaint my car and am thinking of finishing the wheels in natural wood color, artillery type. Is this simply a varnish over the natural wood after the present paint has been scraped and sandpapered off?

2—I also intend to install a model C 3¾ by 5 Wisconsin engine in place of the four-cylinder 4 by 4 engine I have at present. The car has a racing type body, 32 by 3½ tires, weighs 2400 lb., is geared 56 by 17 on direct drive. What speed should this engine give me? The present one will not give much better than 40 m.p.h.

Suffern, N. Y. H. S. V.

—Yes.

2—It is quite difficult to guarantee a car speed as there are so many things which must be taken into consideration. The Wisconsin Co. states that its 3¾ by 5-in. motor has driven a 2200-lb. car 60 m.p.h. It is necessary to have an easy-running chassis in order to attain this speed. With a fairly good design you should have no trouble getting 50 m.p.h.

Magnalium Is a German Product

Editor THE AUTOMOBILE:—What foundries in the United States make magnalium?

2—What is its formula?

3—What are its physical properties?

4—How does it compare with aluminum in strength, etc.?

5—How does it compare with bronze in strength, etc.?

6—What acids, if any, affect it?

7—Is it difficult to machine?

Chicago, Ill. H. E. L.

—There is no foundry in the United States which makes magnalium. Magnalium is the name of a German metal and was imported into this country before the European war broke out and made into castings by the Walker M. Levett Co., New York City. There is no magnalium in the United States to speak of at the present time, and it is doubtful if same is being manufactured in Germany at this time. The Walker M. Levett Co. undertook to produce a metal similar to magnalium when the supply was cut off in August, 1914, and, securing the proper formula and process of manufacture, succeeded in producing the alloy known as magnalite, and this metal has been used since for piston purposes.

2—The formula is not known to any other than the makers.

3—Their physical properties are:

Magnalite	*Magnalium*
Specific gravity—2.59	The same but showing a tensile strength of 4000 lb. per sq. in. less than magnalite.
Weight—161.5 lb. per cu. ft.	
Thermal conductivity—92.0	
Tensile strength 25,400 lb. per sq. in.	
Coefficient of expansion —0.000025.	
Elastic limit—16,800 lb. per sq. in.	
Compression strength—128,000 lb. per sq. in.	

4—This depends entirely upon what is meant by the word aluminum. If pure aluminum is referred to, the table below will give the desired information.

	Magnalite	Magnalium	Aluminum 99 %	Cast Iron
Tensile strength, lb. per sq. in.	25,400	21,400	14,000	16,500
Compression strength, lb. per sq. in.	128,000	128,000	12,000	*90,000

*Average.

However, pure aluminum is not used for commercial purposes without being alloyed; it is therefore necessary to state the alloy before this question may be answered intelligently.

5—There exist many kinds of bronze. The word "bronze" itself means little unless the kind is stated. Certain bronzes show as high a tensile strength as 80,000 lb. per sq. in. and others less than No. 12 aluminum alloy. It is consequently impossible to answer this question with the incomplete data on hand.

6—Concentrated sulphuric acid acts only very slowly on the metal, although the sulphuric acid of commerce usually contains an amount of hydrochloric acid sufficient to rapidly act on the metal.

Nitric acid, either concentrated or dilute, has very little action on magnalite when cold; when heated it acts very slowly.

Sulphur has no action at a temperature less than a red heat.

Magnalite is found to withstand the action of organic secretions better than silver, and is receiving large use for dental plates and surgical instruments, and in places where subjected to carbolic acid or other antiseptic solutions. Magnalite is little acted upon by salt water. Solutions of salt and vinegar, such as it is apt to be subjected to in ordinary culinary operations, do not injure the metal. Magnalite is little acted upon by mineral waters, and withstands the action of sea water better than iron, steel or copper.

Magnalite is not acted upon by carbonic acid, carbonic oxide, or sulphretted hydrogen; but on being melted, will

absorb these gases, quite a portion of which is again excluded on the metal cooling.

7—It is not difficult to machine. It differs in this respect very considerably from aluminum, inasmuch as the chips are emitted very readily without the tendency to bind between the tool and the work. It may be run at very high speed in turning, and an extremely high finish may be obtained on same without grinding. This latter operation is dispensed with entirely in piston finishing.

Cannot Use Battery on Magneto Side

Editor THE AUTOMOBILE:—I have a 1910 Cadillac, which has two separate ignition systems, one for batteries and one for magneto with two sets of plugs. I have taken off the battery system and have been using the magneto system through the summer, and had no trouble in starting, but since the fall has set in, I have considerable trouble in getting the car started on the magneto.

I would like to know if I can arrange the magneto so that I can send the battery current through the distributer and use the one set of plugs.

Martinsburg, W. Va. R. N. S.

—It would be impossible to obtain proper ignition by connecting a battery on the magneto side of the 1910 ignition system. Try closing the spark plug points a little.

Putting Ammeter on 1915 Hupmobile

Editor THE AUTOMOBILE:—Kindly furnish me with the necessary instructions to install a charging and discharging ammeter on the 1915 Hupmobile.

Maysville, Ky. K. B.

—The accompanying illustration, Fig. 1, gives you the connections of the battery, motor, generator, etc., and indicates where the ammeter is to be connected.

Turbines Too Large for Steam Cars

Editor THE AUTOMOBILE:—Explain the operation of the Diesel and Oil-Pull oil engines. By whom and where are they made? If foreign made, who is the agent in this country? I understand that these engines use a crude oil for fuel and that it is fed into the cylinders under about 500 lb. of pressure. Is this correct? If so, explain fully. Why does it carbonize in the cylinders? What ignition and oiling system do they use? What kind of valves? When will their patents become invalid?

2—Could a steam turbine be used in the Stanley steam car to furnish the motive power? If not, why?

3—How many cylinders has the Gnome rotary type motor? How is it attached to the crankcase? How cast, in pairs, fours or single? How many revolutions per minute will it make? How is the gas fed to the cylinders? What oiling system does it use? What kind of valves does it use? What is the greatest fault of this motor?

4—What is the hydraulic brake like?

5—Were the timing gears on the 1913 Lozier light six made of cloth? If so, explain the process by which they were made? Could transmission gears be made this way? If not, why?

6—What is meant by candlepower and volts in electric lamps?

7—Who makes the following parts for the Woods Mobilette, and what is its piston displacement?—Motor, axle, frame, body and steering gear?

8—Will you allow a reader space in each issue or answer a contribution otherwise?

Cooper, N. C. S. T.

—In a Diesel engine the piston on the first down stroke draws in pure air. This is compressed to a very high pressure on the up stroke and as it descends again, oil is blown in through a nozzle in the cylinder head by means of air under a pressure of 1000 lb. per square in. or more. High compression of the air in the cylinder makes it hot enough to ignite the oil which is blown in. The last stroke is a plain exhaust stroke as in a gasoline motor. The Diesel engines are made by many firms in many parts of the world. It would be impossible to publish a list of them here. The valves used are usually poppet valves. The basic patents have long since expired, but the success of the Diesel engine depends mainly upon patented details.

2—No, because it has not so far been possible to make a steam turbine in small sizes.

3—Either seven or fourteen. The cylinders are not cast, but are cut from solid blocks of steel. It makes about 800 to 1100 revolutions. Gasoline is fed through the crankcase and then through valves in the piston heads. Oil is fed with the gasoline. Concerning the motor's greatest fault, would refer you to article by W. F. Bradley in THE AUTOMOBILE for Oct. 21.

4—Brakes which are operated by a fluid medium.

5—Compressed cloth gears have been used for crankshaft drives for many cars. They are made by various processes in which very heavy hydraulic pressure is used to compress the material. The gears cannot be used for transmissions, because they would not stand the jar of engagement consequent upon frequent shifting.

6—Candlepower is the way of measuring the amount of light given by the naked electric bulb without a lens or mirror. Candlepower is a scientific unit of measurement of light. The voltage shows the nature of the current to which the lamp is suited.

7—The parts you mention are not stock parts and are made specially for the car. The piston displacement of the Woods Mobilette is 86.4 cu. in.

8—Whether we publish a letter or not depends upon our estimate of its interest to readers generally. We are always willing to answer any number of letters from readers through the mails.

Wants Hp. Rating of Two Sixes

Editor THE AUTOMOBILE:—Will you please send me the formula rating of horsepower on the Velie light six automobile engine of 1916?

2—Also the rating of the Buick light six of 1916.

Sugar Grove, Ill. J. S.

—The formula rating of both cars is 25.35 hp.

Oldfield's Christie Holds No Records

Editor THE AUTOMOBILE:—Kindly give me the records held by Barney Oldfield's Christie car.

Philadelphia, Pa. B. U. G.

—At the present time Barney Oldfield does not hold any A. A. A. record with a Christie car.

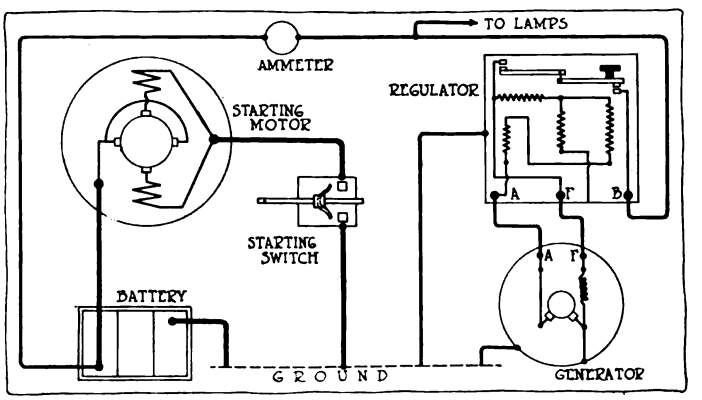

Fig. 5—Wiring diagram for installing ammeter on 1915 Hupmobile

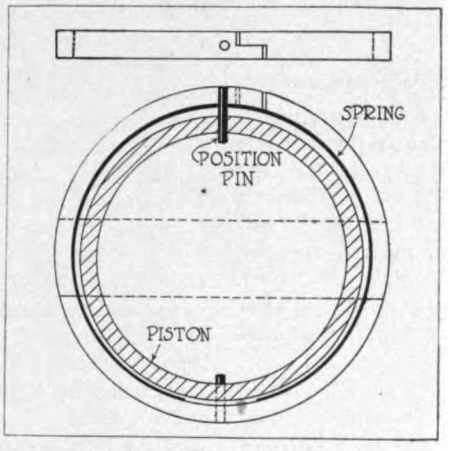
ACCESSORIES

Peerless Simplex Piston Ring

AS shown in the accompanying illustration, this is a lap joint ring within which is a special heat-proof steel spring for preventing leaks at the lap joint. Two or more of these rings per piston should be used, there being a pin in the piston to hold each ring and spring in position, the pin shown in dotted lines in the illustration being that of the adjacent ring, which in each case is diametrically opposite. The rings should be lapped in on worn cylinders if not bearing properly in the same position as pinned on the piston. To place the steel springs in position the rings are placed partly over the grooves and the springs are inserted beneath the rings which are then forced over them and into the grooves. These rings are designed to save oil and to prevent loss of power due to leaky and inefficient piston rings. Prices run from 45 cents each for the 2½ to 3½-in. diameter sizes, the width being 3/16 to ¼ in., to 65 cents each for the 5⅝ to 6-in. diameter with widths of ¼ to 5/16 in.—Peerless Piston Ring Co., Newark, N. J.



Peerless Simplex piston ring

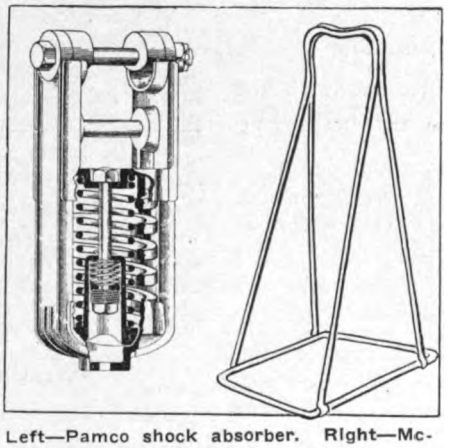
McKinnon Tire Storage Stand

This stand is designed to hold tires off the ground and is made in two sizes, one for Fords and other small cars and the other for larger cars. The small sizes are 15¼ in. high and the other 17 in., the bases being 7 by 8 in. in each case. A set of four of the small sizes weighs 10¼ lb.; and of the large size 11 lb. The stands are made of electrically-welded steel.—McKinnon Dash Co., Buffalo, N. Y.

Pamco Shock Absorber

The Pamco shock absorber is a device intended to replace the ordinary spring shackle and at the same time afford an absorbing device which will compensate for the action of rough roads. The entire device, which is illustrated in section, consists of a triple spring arrangement mounted in a malleable steel yoke forging. The main member is a vanadium steel shock absorbing spring which takes direct loads and acts as a medium between the axle and the regular leaf spring. The shock absorbing spring is a coil and has within it another coil spring which is a self-adjusting load spring and which automatically takes on the proper degree of compression by conforming itself to the weight placed upon it by the car. Through the center of these springs is an equalizing bolt upon which the spring rebound housing travels and at the end of this bolt is a vanadium steel rebound absorbing spring.

The self-adjusting load spring is connected with one shackle bolt while the other shackle bolt connects with the other end of the absorbing device, giving a floating medium which is the shock absorber, between the two shackle bolts. The device sells for $15.—Auto Devices Co., St. Louis, Mo.



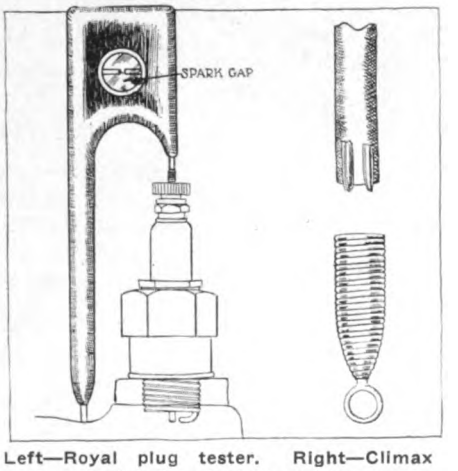
Left—Pamco shock absorber. Right—McKinnon storage stand

Royal Plug Tester

Instead of using a screwdriver or other tool to test a spark plug by grounding it to the cylinder, the Royal tester is used. It is made of an insulating composition and a brass wire runs through it, one end being exposed for application to the plug and the other end exposed for application to the cylinder. A spark gap is placed in the body of the tester with a mica window on each side; this takes the place of the gap made between the end of the screwdriver and the cylinder and is safer because it does not strain the insulation of the coil or magneto by forcing the spark to jump too wide a gap. The tester sells for $1.—Royal Tester Co., Pittsburgh, Pa.

Climax Spring Terminal

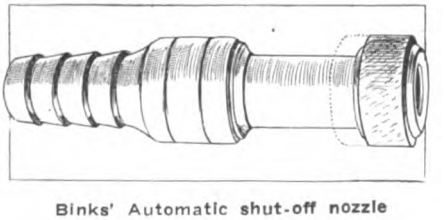
In the Climax terminal, spring steel wire is coiled into the form of a tapered tube with a loop for the spark-plug terminal at the small end and the other end is left open. The insulation of the cable is stripped off for about ⅝ in. and the stranded wires separated and folded back on the cable, which is then inserted in the open end of the terminal with a twisting motion. This provides contact but does not place any strain on the wire of the cable. The makers state that it is impossible for the terminal to work off. Various sizes are made for cable of all outside diameters. A special brass terminal is made for primary batteries.—Climax Motor Devices, Cleveland, Ohio.



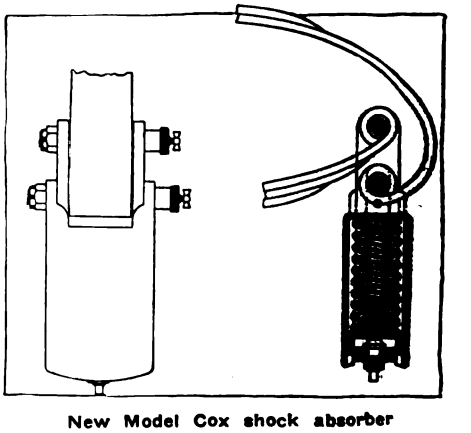
Left—Royal plug tester. Right—Climax spring terminal for cables

Cox Shock Absorber

This shock absorber is still made with three coiled springs nested and adjustable from the bottom by means of a threaded rod with a locking nut to hold it in position. The head and cylinder are now



Binks' Automatic shut-off nozzle



New Model Cox shock absorber

made in one piece to avoid the possibility of weakening at joints. All the bearings have machine fits and the sliding rods are fitted with fiber bushings to make them quiet. The slide bearings have been increased in length to 5½ in. The piston or plunger is 2 by ¾ in. Fittings are made for spring widths of 1¾, 2, 2¼ and 2½ in., and shackle bolts, which are drilled and fitted with grease cups, are made in various sizes. Five different spring weights are made, so that the combination best suited to any particular car can be used; charts are supplied to dealers showing plainly what combinations of springs to use under given conditions. Price, $10 per set.—Cox Brass Mfg. Co., Albany, N. Y

Binks Water Valve

The Binks valve for car washing has an automatic shutoff which stops the flow of water the moment the operator releases his hold on the nozzle, a pressure of the thumb being sufficient to keep the valve open. The nozzle is nickel-plated brass with a rubber bumper to prevent damaging the paint. It is made for ¾-in. hose and sells for $1.—Star Brass Works, Chicago, Ill.

New-Type Lamps for Fords

This is a set of lamps designed to take the places of the standard Ford side and tail lamps; they can be attached by bending the original brackets. The set includes, in addition to the lamps, all wiring, connectors, body bushings and switch on each lamp. Lenses are of the semaphore type. Bulbs are supplied in voltage as ordered. The set comes neatly boxed, ready for installation, and sells for $5.—Wood Mfg. Co., Fairfield, Conn.

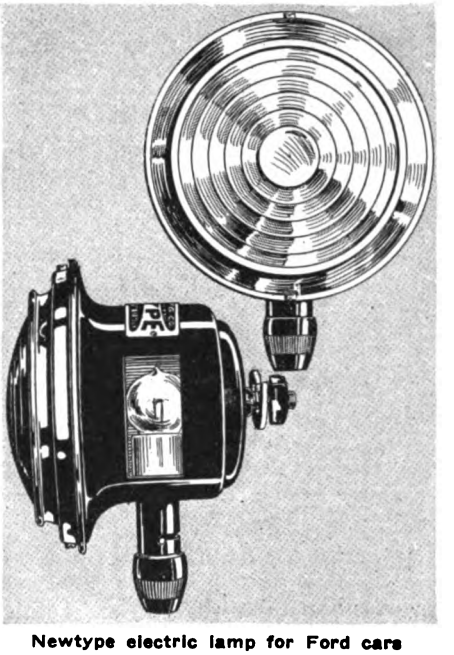
Affa Spindle Adjuster

The Affa spindle adjuster for Ford cars consists of a strong flat steel spring fitting inside the steering rod yoke and pressing against the spindle arm, the pressure automatically taking up wear and preventing rattle from looseness. The adjusters sell for 50 cents per pair. —W. S. Graffam, Northampton, Mass.

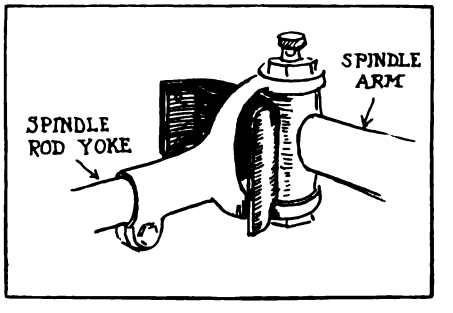
Burners for Gas Lamps

Users of acetylene lighting will be interested in the Brilliant type of burner which is claimed to increase the intensity of the light three times without increasing the cost of operation. That is, while the common acetylene burner gives 20 candle power, according to the makers, the Brilliant burner will give 60 without using any more gas. The burner is interchangeable with the ordinary burner, and its principle depends upon the use of the small incandescent button ⅞ in. diameter. An acetylene jet is projected against this button and the upper part of the burner is turned so that the face of the button is toward the reflector, as shown in the illustration.

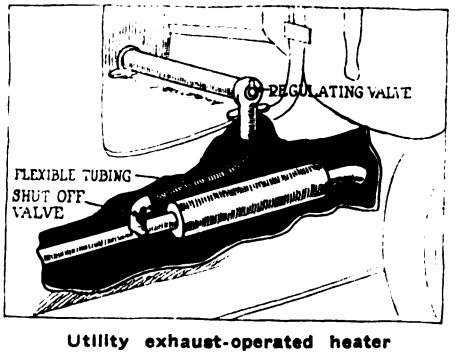
This is the position of the button for ordinary driving. To produce a diffused or spreading light it is only necessary to turn the white face of the button away from the reflector, which will immediately cut out the reflector and dim the light. The price is $3 per set, consisting of two burners complete and one extra button. Extra buttons sell for 70 cents per pair. —Monosmith Bros., Spencer, Ohio.



Newtype electric lamp for Ford cars



Affa steering spindle adjuster



Utility exhaust-operated heater

Utility Exhaust Heater

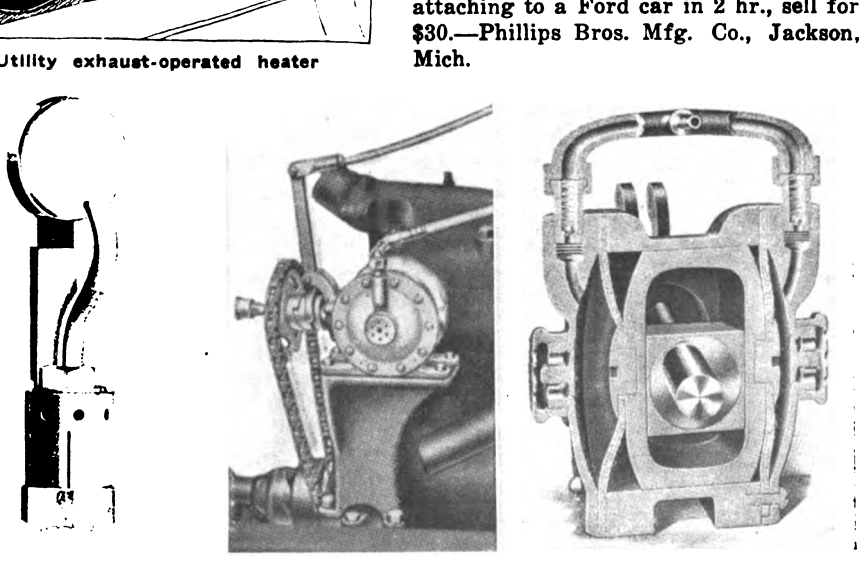
This heater consists of a tubular footrest through which part of the exhaust is allowed to pass, after which it escapes into the air. A small pipe is tapped into the exhaust pipe ahead of the muffler and is led to one end of the heater-footrest; a regulating valve is inserted at the junction. The waste pipe at the other end of the heater completes the equipment. The boring of two small holes in the floorboard with the drilling and tapping of the exhaust pipe and the screwing of the heater to the floor are the only operations required for installation. It lists at $15.—Hill Pump Valve Co., Chicago, Ill.

Champion Duplex Tire Pump

It is claimed that the Champion duplex diaphragm pump will fill a 3-in. tire up to 60 lb. in less than 40 sec., it being possible to run it at 800 r.p.m. for an hour without trouble. As shown in the illustrations, there is an eccentric driver and two diaphragms so that there are two pumping operations at every revolution. One of the points of design is that the pump is so constructed that it is impossible to pump oil into the tire, an exceedingly valuable feature inasmuch as oil is very injurious to the rubber of the inner tube. The principle of operation is shown in the sectional illustration. These pumps sell for $20 each.—Champion Auto Equipment Co., Chicago, Ill.

Phillips Elliptic Springs for Fords

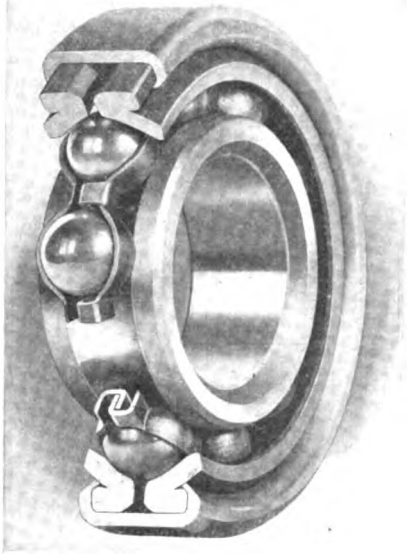
Four elliptic springs and all parts for attaching to a Ford car in 2 hr., sell for $30.—Phillips Bros. Mfg. Co., Jackson, Mich.

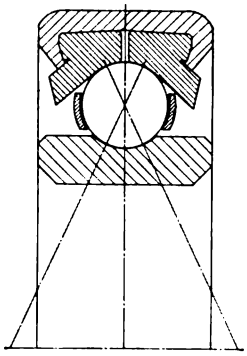


Left—Monosmith Brilliant burner for acetylene lamps. Center—Champion duplex diaphragm tire pump, showing mounting. Right—In section

Schatz Annular Bearing Takes Thrust

Sustains 50 Per Cent of Rated Radial Load in Either Direction Without Adjustment





Above — Diagram showing ball support in Schatz annular bearing

Left — Cutaway section of Schatz bearing, showing assembly

AN annular ball bearing capable of sustaining a thrust load of 50 per cent of the rated radial load in either direction and without adjustment, has been brought out by the Schatz Mfg. Co. of Poughkeepsie, N. Y. The bearing which is known as the Schatz Universal annular ball bearing gains its ability to withstand end thrusts due to the arrangement of the outer race which provides two points of contact instead of one as in the conventional type of bearing. Thus the balls have three points of contact, two points in the outer race rings and the third located in the inner race ring.

The Two-Point Contact

Referring to the assembly view, it will be noted that the outer race is in two parts each of which have a curved recess generated on their inner periphery forming a raceway for the balls. It is here that the two-point contact is secured. A curved ball track is generated on the outside of the cone or inner race ring and is designed to allow precise co-axial rotation. The curvatures of the raceways in the outer race rings and in the cone are 4 per cent greater than that of the ball therefore giving, theoretically, point contact, although under load providing a contact area large enough to support a high thrust load.

The two-point contact of the outer race is so arranged that the points are located at a given angle on either side of the center line of the bearing while the center line passes through the third point of contact at the inner race. Diagrammatically the three-point contact gives a triangular support which gives a resultant action that permits the high end thrusts to be endured.

Large Thrust Overload Permissible

While the bearing cannot be called a thrust design, the large thrust overload permissible in many cases would obviate the necessity for an additional thrust bearing and would consequently lessen the cost of the installation as a general rule in such instances. It is also claimed for the bearing that the three-point contact increases the load capacity since with this arrangement the shock is not transmitted through the centerline of the ball. Broken balls are practically always due to a shock through the center and with the three-point contact, the area affected is so much greater that the unit stresses are smaller.

The actual construction of the bearing is shown in the accompanying illustrations and the triangular layout of the support is also shown. The cup rings are a press fit in the outer case and after assembling the case is closed over the cups thus permanently fixing the inter-relationship between the various parts of the bearing.

Maximum Number of Balls Used

The ball separator, which is also shown, is of pressed steel and is a self-locking design without rivets. The principle upon which the separator is constructed allows the maximum number of balls to be used and also supports them upon their axis of rotation or at the points of least friction and wear.

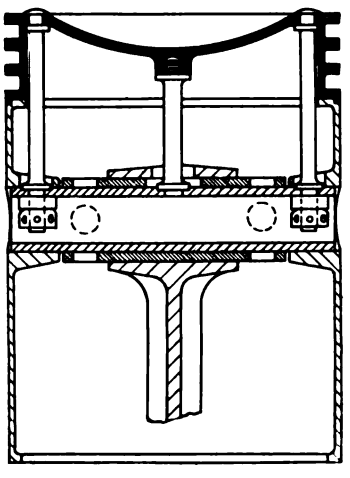
The accuracy of the balls is checked to 0.0001 in. and the surface finish is also carefully checked to insure smooth and quiet running.

All Parts Heat-Treated

High quality materials are used throughout in manufacture; all parts being high carbon chrome alloy steel except the case and ball separator. All the steels are made to a definite analysis and must conform to the required physical standards. As a check on the materials, each heat is analyzed to determine the chemical constituents of the steel. All the parts are heat treated in the furnaces of the Schatz company, which are carefully checked by delicate electrical pyrometers.

The dimensions of the bearings, as regards diameter, width and bore are in accordance with the international standards covering these points which renders the bearing interchangeable with those of other makes. S. A. E. standards are used throughout.

New Steel Piston Design



C. Y. Knight's steel piston

THE accompanying cut shows a built-up steel piston recently the subject of a patent granted to C. Y. Knight. The idea is, of course, to combine lightness and strength for purposes where cost of production is a secondary matter. The method for supporting the wristpin directly from the head permits the pin to have a very long bearing in the connecting-rod, and the piston should be a far better manufacturing proposition than a steel piston cut from the bar in one piece.

More Class Legislation

THE proposal in the President's message to Congress to tax automobiles 50 cents per horsepower and also to impose a tax of 1 cent per gallon on gasoline can only be looked upon as a double taxation on progress. It is class taxation of a highly discriminatory character and a movement that will meet with country-wide opposition, not because the people do not want to carry their just share of the burden of taxation for national defense or other legitimate measures, but, because the present plan is diametrically opposed to the spirit of equality defined in the constitution.

In meeting emergencies, such as Congress is today confronted with, the equitable plan is to tax all forms of business on a uniform basis, rather than the highly unfair method of selecting certain businesses that may be more in the public eye than others and placing the burden on them. The American citizen is fully cognizant of the necessities of taxation, he or she does not desire to shirk responsibilities to the nation, but asks for a just division of them.

Automobilists are in accord with any effective, just program, and hundreds of thousands of them stand ready to place their cars at government disposal for national defense if emergencies arise, but these hundreds of thousands should determinedly combat this latest form of class taxation.

Progress in Ignition

DURING no period of the history of the automobile industry has the demand for the most efficient ignition been so great as at present. The requirements are more severe upon this part of the motor functioning than ever before and it is but natural that developments have been made in the ignition field and are even now in progress.

Higher speeds and more cylinders are translated to the ignition manufacturer in terms of more sparks per minute. This means faster breaker mechanisms, faster coils and the elimination of inefficiencies due to lag in the current and due to losses of time in the mechanical actuating mechanism. The methods by which the difficulties have been overcome show that, highly ingenious as the ignition system of to-day is, its limit and capacity have not even nearly been reached.

Perhaps the most significant feature of the ignition development is that in no case has it been necessary to abandon the elementary principle upon which a system operates. Where makers have made improvements it has been merely in the way of lightening breaker parts to overcome inertia, increasing the speed of the coil by improved manufacture and simplifying and rendering more efficient the switches controlling the circuit and the mounting of the unit on the motor.

Ignition for eights and twelves running at high rotative speeds has not puzzled to any alarming extent ignition manufacturers, and where twelve-cylinder motors have been brought out, makers have not been put to any difficulty in securing suitable ignition for them. Improvements, however, are under way even now in the multi-cylinder field and there is no doubt that important ignition progress will be noted within the next few months.

Lubrication in Extenso

THE European car described on page 1 is not being manufactured yet, as manufacturing is understood even in Europe, but even though it is no factor on the markets of the world, even though it may never be manufactured in its present form exactly, it marks a milestone in automobile development. It is reputed to perform well, but did it lack power; did the main frame design prove wrong, the axles weak, the motor inefficient, it would make no difference. A car which needs no attention whatever more often than twice a year is so important an advance in idea upon the conventional principles of automobile engineering that it cannot ever again be forgotten.

This car demonstrates that complete automatic lubrication for every part, however small, is a practical possibility, and that its cost would not be prohibitive. The application to a more conventional type of chassis is a mere matter of detail work, it is the main principle that is so impressive. In a year of enormous development in America and of equally great stagnation in Europe, the latter hemisphere has to its credit at least this achievement.

S. A. E. Winter Session Program

Standards Committee Meets Jan. 4 and Whole Body on Jan. 5 and 6

NEW YORK CITY, Dec. 7—The program for the winter activities of the Society of Automobile Engineers which will extend over Wednesday and Thursday, Jan. 5 and 6 as regards the meeting of the whole body, and Jan. 4 for the Standards committee has been tentatively announced. The meeting will be held at the Engineering Societies Bldg., at 29 West Thirty-ninth Street, and the dinner on Thursday, Jan. 6, at Hotel Plaza at 8 p. m.

Details of the tentative program are given in the November Bulletin of the society as follows:

Wednesday, Jan. 5, 9.30 a. m., Engineering Societies Building, Business Session, Treasurer's Report, Reports of Tellers of Election of Officers, Report of Membership Committee and New Business.

Standards Committee Reports:—Report of Electrical Equipment Division, A. L. Riker, vice-president and chief engineer of the Locomobile Co. of America; Report of Engine and Transmission Division, Prof. W. T. Fishleigh, Engineering School, University of Michigan; Report of Electric Vehicle Division, A. J. Slade, consulting engineer; Report of Iron and Steel Division, K. W. Zimmerschied, metallurgist, General Motors Co.; C. H. Loutrel, Report of Lock Washer Division, C. H. Loutrel, assistant factory manager, National Lock Washer Co.; Report of Miscellaneous Division, John G. Utz, consulting engineer, Perfection Spring Co.; Report of Research Division, David L. Gallup, professor, gas engineering and consulting engineer, Worcester Polytechnic Institute; Report of Springs Division, C. W. McKinley, chief engineer, Willys-Overland Co.; Report of Truck Standards Division, W. P. Kennedy, consulting engineer.

Professional Sessions

Thursday, Jan. 6, 9.30 a. m., Auditorium of the Engineering Societies Building, Professional Session; President's Address, Wm. H. Van Dervoort, president and general manager, Moline Automobile Co.; Address of President-Elect; Effect of Sulphur Content in Steel, Dr. J. S. Unger; Electric Bulbs for Automobiles, Henry Schroeder.

Thursday, Jan. 6, 2 p. m., Professional Session, Battery versus Magneto Ignition; Alexander Churchward, vice-president, Gray & Davis Co., Frank Conrad, electrical engineer, Westinghouse Electric & Mfg. Co., Dr. R. H. Cunningham, chief electrical ignition engineer, Splitdorf Electrical Co., E. Gassman, technical director and secretary. Eisemann Magneto Co. and Electric Lighting and Starting, Joseph Bijur, president, Bijur Motor Lighting Co.

Mid-West Section S. A. E. Elects Officers

CHICAGO, ILL., Dec. 2—Formal organization of the new Mid-West section of the Society of Automobile Engineers with headquarters at Chicago was completed at a meeting of members of the Society from Illinois, Indiana, Wisconsin, Minnesota, Iowa, and northern Indiana at the Chicago Automobile Club last night. This is the outgrowth of a movement among members of the S. A. E. in this territory which took shape Oct. 14 at the time of the meeting of the Standards Committee of the general society in the organization of a temporary section and election of temporary officers, with W. H. Vandervoort of the Moline company, President of the Society, as chairman.

Permanent officers were elected last night as follows: Chairman, F. S. Place, vice-president, the Buda company; vice-chairman, J. W. DeCou, factory manager, Thos. B. Jeffery Co.; treasurer, Charles W. Steiger, president Stromberg Motor Devices Co.; secretary, Darwin S. Hatch, Editor *Motor Age;* assistant to secretary, H. W. Connell, Central Continuation School, Milwaukee. The governing board consists of the above officers with addition of Daniel Rosch, assistant professor of Experimental Engineering, Armour Institute of Technology.

Headquarters have been established at the Chicago Automobile Club. There are between fifty and sixty members of the Society in Chicago and 200 in the territory embraced by the new section.

—

Three New Jones Models

WICHITA, KAN., Dec. 3—The Jones Motor Car Co., this city, is bringing out three new models, two of which will appear on a six-cylinder chassis with 122-in. wheelbase as a seven-passenger touring car and a roadster, the third model being a five-passenger touring car on a 110-in. wheelbase chassis and using a small six motor.

W. A. King is production manager and chief engineer of the company and N. A. Wise has been appointed chief engineer and assistant production manager.

—

Detroit S. A. E. Fund Is $2,900

DETROIT, MICH., Nov. 30—The Eclipse Machine Co., has been added to the list of contributors to the maintenance fund of the Detroit Section of the Society of Automobile Engineers. The total contributed to Nov. 15 is $2,900.

231,713 Registered in New York

Divided into 171,698 Cars and 22,949 Trucks—2194 Dealers

ALBANY, N. Y., Dec. 8—Over 36 per cent increase in the number of automobiles registered in New York State since Feb. 1, is revealed in the statement issued to-day by Secretary of State Hugo. The latest figures show that up to Dec. 4 there were 231,713 owners registered and 79,899 chauffeurs. The majority of cars registered, according to the records, are under 25 hp., the exact number being 112,373, while of the remainder, 70,426 are under 35 hp.; 21,790 under 50 hp. and 1224 of 50 hp. or more, or seventy-four less than the total in 1914. In comparison with the State Census figures, taken in June, the count shows that there are about forty inhabitants to each car registered, or 122 persons for each chauffeur licensed.

22,949 Trucks

The total of 231,713 cars registered so far includes 171,698 passenger cars; 22,949 trucks, while there are 2194 dealers registered, each having from one to twenty-five cars in stock, although these machines prior to their sale are not usually registered separately. There were 6807 duplicate sets of plates issued to these dealers. The figures for the same period last year were 169,280, 150,501, 17,037 and 1742, respectively. Of the chauffeurs licensed so far, 58,179 were renewed from last year, when the total number licensed was 65,773, while 21,720 are new.

—

Standard in Small Truck Field

DETROIT, MICH., Dec. 3—The Standard Motor Truck Co., this city, has added a 2-ton worm-drive truck, selling at $2,000, to its present list of 3- and 5-ton models.

The company will later add a 1- and 1½-ton model. In order to take care of the manufacture of its new models, the company will make additions to its plant.

—

Bieling Joins Nordyke & Marmon

INDIANAPOLIS, IND., Dec. 7—W. M. Bieling has resigned as sales manager of the Premier Motor Mfg. Co., this city, and joined the sales organization of the Nordyke & Marmon Co.

—

De Palma Joins Packard

DETROIT, MICH., Dec. 4—Ralph De Palma has joined the Packard Motor Car Co., this city, as a member of the engineering testing department.

Goodyear Earns 5½% on Common

Sales $36,490,652—Net Income $5,137,082—Assets $14,500,000

AKRON, OHIO, Dec. 7—The earnings of the Goodyear Tire & Rubber Co. for the year ended Oct. 31, after all charges were deducted, were approximately 5½ per cent on the common stock. The company's sales were $36,490,652, against $31,056,128 in the previous twelve months. Its net income was $5,137,082. Its current assets are $14,500,000 and its current liabilities $1,944,000.

The balance sheet as of Oct. 31 follows:

ASSETS	1915	1914
Real estate and bldgs...	$3,883,946	$3,606,537

Mercer Uses Aluminum Pistons

TRENTON. N. J., Dec. 6—The announcement of the line of cars made by the Mercer Automobile Co., of this city, shows that only minor refinements have been made for 1916, especially as regards the chassis lengths and in the body work.

The new series is known as the 22-72 model and in general design the new models adhere closely to the previous 22-70. Four different body styles are offered, a six-passenger, four-passenger, runabout and raceabout. The six-passenger touring is adapted to family use while the four is a sporting model. Both of these cars have 132-in. wheelbase. The runabout and raceabout are built on a chassis of 115-in. wheelbase. The raceabout is a special speed car with a guaranteed speed of 1 mile in 48 sec., or 75 m.p.h.

While in general the bodies have the same distinctive appearance as those of a year ago, the interior has been improved; for instance, the auxiliary seat compartment of the six-passenger is finished in black walnut paneling. Doors that roll out of sight like the cover of a roll-top desk hide the extra seats. A complete set of tools is carried in a special compartment built into the right front door.

Under the center cowl of the sporting model are three separate compartments for carrying Thermos bottles and miscellaneous items. The middle compartment is sufficiently large to carry a suit case.

Power plant is the same four-cylinder L-head design, 3¾ by 6¾ in. giving an S. A. E. rating of 22 hp. although the makers claim 72 on the block. The piston displacement is 298.2 cu. in. Very light reciprocating parts are used, the connecting-rod weighing with four bolts, 3 lb. 5 oz. These are drop forgings from special high tensile steel. The pistons are aluminum and the only attachment to the exterior of the motor is the Zenith carbureter, the manifold being cast integrally with the cylinders.

The prices are $3,000 for the touring and sporting models, $2,900 for the runabout and $2,750 for the raceabout.

Franklin to Increase Common to $2,000,000

SYRACUSE, N. Y., Dec. 4—Stockholders of the H. H. Franklin Mfg. Co. on Dec. 8, vote to increase the common stock from $900,000 to $2,000,000. The preferred stock, amounting to $600,000, is all in the treasury of the company.

Sparks-Withington Buys Cleveland Radiator Co.

JACKSON, MICH., Dec. 4—The Sparks-Withington Co., this city, manufacturer of automobile signals, radiator fans, etc., has completed arrangements for the purchase of the factory, equipment, and commercial good will of the Cleveland Radiator Co., Cleveland, Ohio, which has manufactured honeycomb radiators for the trade. The complete equipment of the Cleveland factory will be moved to this city and installed in the old Sparks-Withington plant where the manufacture of honeycomb radiators will be started. Quantity production will be under way by Feb. 1. The Sparks-Withington company will soon break ground for a large addition to its plant.

Elliott of United Truck to Sail

GRAND RAPIDS, MICH., Dec. 7—E. M. Elliott of the United Motor Truck Co., will sail Dec. 11 for Europe to observe United trucks in action in England and on the Continent.

G. P. Sweet has been made general manager to succeed Elliott. Mr. Sweet returns from Detroit, where he has been engaged for several years in the manufacturing business.

Another appointment is that of George H. Duck as general sales, advertising and factory manager of the United Truck Co. Mr. Duck has been with the company since September.

Pouvailsmith Corp. Formed

Buys Essex Rubber Condensite Dept.—Warm Hand Steering Wheel Corp. Absorbed

POUGHKEEPSIE, N. Y., Dec. 4—The Pouvailsmith Corp., capitalized at $2,500,000, has been organized here and has purchased the condensite department of the Essex Rubber Co., Trenton, N. J. Condensite is a chemical product of formaldehyde and carbolic acid and makes one of the best non-conductors known, also having a highly polished surface. It is used extensively in the manufacture of steering wheels, accessories and many other products. In connection with the taking over of the condensite department of the Essex company the Pouvailsmith Corp. will absorb the Warm Hand Steering Wheel Corp. of this city.

Of the $2,500,000 capital of the new corporation $500,000 is preferred and $2,000,000 common. There is no stock for sale. The officers of the company are Grant E. Smith, Elias C. Vail, vice-president, J. Wilson Poucher, treasurer and Henry S. Morgan, secretary. Mr. Morgan has been factory manager for the Essex Rubber Co. since the beginning of its condensite business and will be director and factory manager of the Pouvailsmith corporation.

For factory purposes the Pouvailsmith Corp. has purchased 5 acres of land fronting on Smith Street and extending east along the Central New England railroad tracks, where three buildings, having a total length of 340 ft. and a width of 60 ft., will be erected immediately. The railroad will provide a spur for the factory. The new plant will begin operations with about 100 employees. Until this is ready the Pouvailsmith Corp. will operate the condensite department of the Essex company in Trenton, of which it is now in possession.

Puritan Buys Cartercar Parts

DETROIT, MICH., Dec. 8—The Puritan Machine Co., this city, has bought outright the Cartercar parts business. The contract with the General Motors Co. as executed by the Puritan company, provides that service for the Cartercar is secured complete in every detail as long as the life of the car.

Webber Joins Haynes-Ionia Co.

IONIA, MICH., Dec. 4—H. B. Webber, president of the National Bank of Ionia, and several manufacturing concerns, has accepted the position of general manager of the Haynes-Ionia Co., one of the biggest manufacturers of automobile bodies, and sheet metal parts in the country.

English Automobile Engineers Are Not Neglecting Development, Despite War

Water-Cooled Rotary Engine and Gas Turbine Under Way—Work on Sleeve-Valve Eight and Several Small Cars—A New Rear System

LONDON, ENG., Nov. 25—The great advance made by American automobile engineers during the course of the last two years has been obvious to the automobile world at large. There were many who prophesied at the outbreak of war, that, until its close, ordinary commercial progress would be largely stagnated. The automobile progress made in America has given the lie direct to such assertions. Even in Europe it has been commented on several times in English, French and German journals. The country most concerned, however, is certainly Great Britain.

While the actual causes of recent tariff on imported automobiles are undoubtedly cumulative, it is nevertheless an open secret that the advance made by American manufacturers in design, materials and workmanship was a potent factor in the deliberation of British manufacturers when they decided to approach the government for legislative protection. Had not American cars improved in the way they have, the British manufacturing trade would not have been so perturbed. It is admitted that so far as general specification goes, the American product is very far in advance of the British automobile speaking in terms of average—as it was known at the outbreak of war. One is led, therefore, to wonder what automobile manufacturing in England is doing. Is it sitting down calmly under fate, with hands tied by the force of circumstances, merely watching American progress in design? Is it able, while chiefly concerned with the production of munitions in its motor car factories, to give attention to the all-important question of automobile progress? A knowledge of the facts will come as a surprise to many people. Automobile England is very wide awake.

Study Engine Designs

A number of British manufacturers are deep in the study of engine design so far as the question of the number of cylinders is concerned. When the eight movement started in America it was not taken very seriously by the leading British manufacturers. Now, however, things are quite different. Not only is the eight being worked upon by several leading manufacturers, but in one case of importance at least, the twin six is engaging the serious consideration of the designing and experimental staff. Two experiments, they are no more as yet, go even in advance of American ideas, as in one case a water-cooled rotary engine is now being tried out experimentally by its inventor for a large manufacturer, and in another a new form of gas turbine is being finished off on paper. Of these two propositions the former is promising, though considerable trouble has been encountered in making the rotating flapper pistons gas tight.

In regard to the question of the eight and the twin six, however, matters are on a more substantial basis. A number of firms are working along these lines, and the results so far obtained are very good.

The chief engineer of a large firm is loud in praise of eight possibilities.

An Electric Gearshift

There is a very ingenious new electrically-controlled gearbox, which is finding much favor. To be able to make a perfect change by merely pressing a button on the steering wheel is undoubtedly an ideal method. It has already been proved possible and it now only remains to prove whether or not the invention is practicable as a manufacturing proposition and whether it will prove sufficiently reliable not to require the usual lever control as an emergency standby.

A Sleeve-Valve Eight

Then again, there is a sleeve-valve eight under way. Just before the outbreak of war, Minerva in Belgium was also busy with the design of a sleeve-valve eight. As this firm has proved the high efficiency of this type of engine in the racing world, its eight, if it sees the light of day, shall prove a very interesting proposition.

British manufacturers are studying the refinement of these new engines very carefully. Such things as the permanency of tappet adjustment, the elimination of vibration and the reduction of skin friction for the passage of the inlet and exhaust gases are studied just as carefully as detail units of design, as the whole proposition is as an engine. In a word, the British manufacturer who puts an eight on the market after the war is expecting to take a place right in the front with the new development. In just the same way as the Britisher has claimed superiority for his product on account of its excellence in material and workmanship in the past, so will he in the future on the new engine. If close application and careful experimenting are not behind their usual value, the eights to be marketed in the future by several leading British firms will undoubtedly be of a very high grade.

New Car Models

Even in England, the majority of motorists picture their own car factories as entirely engaged on the production of munitions. Speaking broadly, they are, but nevertheless a number of firms are still able to make cars, and a few are still being made and sold to the ordinary public. After the panic of the early days of war, British manufacturers naturally began to think of their future in the happy days when piping peace reigns once more. In most of the chief factories it has been found possible to do something in regard to new models, or redesigning the pre-war existing ones to bring them up to date. A number of actual new cars are on the road for test at the present time. It is, however, more important to know that the quality of the firms is first rate. Among such cases are several of the leading firms in Britain, though as the new cars are commercial secrets we cannot refer to them by name. A famous firm has an entirely new design of small car, like a Ford, so far as the idea of providing the maximum for a minimum outlay is concerned. It will probably be sold at a good deal less than half the cost of the cheapest car previously sold by the firm in question. The car itself is not only interesting as a designing proposition, but is a good performer. Acceleration and hill climbing are both markedly good characteristics, and the initial cost and upkeep are both low.

Two firms whose racing records are well known have also produced entirely new models. In one case it is a small car, much smaller and cheaper than the firm has previously produced and in the other case it is a much larger and more luxurious car. Then there is another firm that specialized on one model only, and a very popular one, before the war, that has brought out an improved form of the same general design, but larger and more commodious, and with a number of improvements. This firm is also carefully maturing plans for a quick continuation of its ordinary business routine so soon as the war is over, and its expectations of a large sale for the new model will in all probability be fully realized.

A New Rear System

One more case as indicative of the general trend in England may be cited and it is an important new entrant into the field of car production. A large firm of accessory manufacturers has the first chassis of its new venture on the

road, and the preliminary trials have been quite satisfactory. It is a small car largely on conventional lines, but with a new system of rear suspension which prevents the chassis from being on orthodox lines. It is early yet to prophecy either success or failure for this new venture, as it has only just seen the light of day so far as road trial is concerned.

It will be seen from the preceding information, that the idea so prevalent that England is not, and cannot, do anything to keep pace with automobile progress, is far removed from fact.

—

Hercules Motor Mfg. Co. Formed with $500,000 Capital

CANTON, OHIO, Dec. 4—The Hercules Motor Mfg. Co. has been incorporated in this city with a capital of $500,000 by backers of the Ohio Motor Mfg. Co., which will soon build a large plant in the Aultman group.

The incorporators of the company are H. E. Black, E. A. Nist, J. M. Baer, H. L. Alexander and I. M. Chandler. The charter of the company authorizes it to manufacture, buy, sell and deal with motors and motor devices and internal combustion engines for use in automobiles, trucks, tractors and all self-propelled vehicles.

It has been decided to build in the Aultman group a plant 65 by 400 ft., two stories, at an estimated cost of $50,000. Work on the building will start at once. One hundred and fifty men will be employed. Under the direction of Charles Ballough, consulting engineer and designer, an organization is now at work at Springfield turning out sample motors, etc.

—

Saxon Builds 19,036 Cars

DETROIT, MICH., Dec. 6—With the production for December estimated at 1500 cars, the total output of the Saxon Motor Car Co., for 1915, is estimated to be 19,063 cars, or 11,740 more than in 1914 when 7323 cars were made. The production for 1916 is planned to be for 30,000 cars or more. Figures for 1914 and 1915 are:

Month	Year 1915	1914	Increase
January	706	....	706
February	844	13	831
March	1,041	470	571
April	1,738	762	976
May	2,024	1,255	769
June	2,710	1,787	923
July	1,658	618	1,040
August	1,799	876	923
September	1,158	641	517
October	1,935	460	1,475
November	1,950	175	1,775
December	**1,500	266	1,234
Total	19,063	7,323	11,740

**Estimate only.

By acquiring the four-story brick plant formerly occupied by the Studebaker Corp. on Franklin Street, the Saxon company has added nearly 60,000 sq. ft. of floor space to its plant which now has more than 120,000 sq. ft.

Business Booms in Southwest

—

Car and Accessory Dealers Find Oil, Wheat and Cotton Boost Sales

KANSAS CITY, MO., Dec. 4—The month just ended brought a tremendous volume of business to the car and accessory dealers who supply the Southwest trade from here. With bank clearings in Kansas City making high record marks every year, with the wheat beginning to move from Kansas to the markets, with oil on the jump in Oklahoma after a big crop year, and with unusually open weather throughout the entire district, heavy sales have resulted and dealers expect their branches will enter the new year with practically no unsold cars on hand.

Record Bank Clearings

The bank clearings are, of course, the best barometer of the district. Three records were broken in the month of October, and in November the same story was repeated with a total for the thirty days of $394,019,925—the banner month in the history of the local clearing house association. The clearings for the entire year of 1914 were $3,015,811,567, but with the close of November this year has broken that high figure by $442,000,000. Bankers confidently expect the year's total to approximate $4,000,000,000.

The largest volume of local business comes, of course, from Kansas where the farmers have been blessed with a big wheat crop that commands unusually high prices and, because of the record yield of a year ago, have fewer mortgages and notes to pay off than in previous seasons. The 1914 crop cleaned up old debts that had been hanging over; the 1915 wheat will go largely into the purchase of automobiles, pianos, etc.

Oklahoma Doing Well

Oklahoma is doing well. The cotton crop was large, so was corn and wheat, and prices on all three products are high. Some sections of the State are experiencing their first good season in three years. They are buying cars heavily.

But of more importance to Oklahoma is the present oil boom that has steadily raised the value of the crude product at the well until now it is selling at $1 a barrel, with additional royalties being paid by some companies in order to meet their demands. Boom stories of new fields opened, of men suddenly rising to wealth, of scraggly land on which poor farmers have been scratching for a living for years turning into big production centers, and of persons holding old leases cashing them in for big profits and easy money.

Missouri has not been so fortunate, however. Rains throughout the summer cut down the grain crops somewhat but business conditions throughout the State are sound. The mining districts of the southwestern section of the State are producing heavily to meet the war-time prices.

—

Prosperity Hits the South

LOUISVILLE, KY., Dec. 8—Southern automobile dealers, branch managers, factory representatives and manufacturers are elated over the remarkable business expansion in the South, which is one of the outstanding features of the prosperity now sweeping the country. This means an increase in the sale of automobiles, it is predicted.

Optimism is in evidence everywhere, and those in close touch with the automobile trade in the South declare that 1916 will be the biggest year in the history of the industry below the Mason and Dixon line. A conservative estimate, based on interviews with leading dealers, points to an increase of about 50 per cent in the sales during the past four weeks over the same period last year. Some say they have sold twice as many cars.

—

Willemin Resigns from Hupp

DETROIT, MICH., Dec. 4—A. B. Willemin, who was assistant general manager of the Hupp Motor Car Co., has resigned.

—

Jarman with Canadian Briscoe

JACKSON, MICH., Dec. 4—Walter G. Jarman has been appointed treasurer and general manager of the Canadian Briscoe Motor Co., and will locate in Brockville, Ont. Mr. Jarman has been assistant sales manager of the Briscoe company here

—

Lewis Joins Campbell-Ewald Agency

DETROIT, MICH., Dec. 4—E. St. Elmo Lewis, one of the best known advertising and sales executives in the country, has joined the Campbell-Ewald Co., advertising agency, as advertising and sales counsel.

—

Revoke Drawbacks to Members of Old A. L. A. M.

WASHINGTON, D. C., Dec. 6—Secretary of the Treasury has informed the collector of customs at New York that in view of the fact that treasury decision of Dec. 19, 1908, providing for the payment of drawback on automobiles manufactured by members of the A. L. A. M. with the use of imported materials, has become inoperative as to a large number

of the members of said association and that conditions of manufacturing have changed to a great extent since the promulgation of said decision, the same has been revoked, the revocation to become effective as to all shipments exported on and after Dec. 24. The department has advised all members of the revocation and that an application for a new rate of drawback must be made by each member to cover shipments after Dec. 24.

—

Price Advanced 1 Cent on Gasoline for Export

NEW YORK CITY, Dec. 6—The Standard Oil Co. of New York has advanced the export price of gasoline 1 cent a gallon, covering all grades and all packages, to take effect at once.

Unprecedented demand, it seems, instead of reducing the price of gasoline has had an opposite effect. One effect of the high cost of gasoline is the inability of the Standard Oil Co. to supply the demand.

An unforeseen shortage in Oklahoma is the main factor in the present high prices. Last year the fields in that State produced between 300,000 and 400,000 barrels of crude oil per day and it was expected that the production would be kept up for at least two years. Suddenly the fields seemed to peter out and the production at present is about 100,000 barrels per day.

Added to the large domestic demand is that of Europe, which is using more gasoline than it was in time of peace and producing very little. Its importation is almost entirely from the United States, the quantity obtained from Canada being very small. What is being produced in Russia and Galicia is not known.

With this large European demand on hand, the Standard Oil Co. has been hampered by the scarcity of ships. England has taken out of the market 115 ships that were available for use. This company uses tank steamers or carriers to transport much of the crude from Texas, Mexico and South America and there is danger of confiscation by the belligerents. The company was paying $3.50 per day per ton on chartered boats but the scarcity has brought the price up to $42.

In Georgia gasoline has been advanced in price on the tank wagon basis, 1 cent a gallon, at all stations in Georgia and Alabama. The price at Atlanta is now 21 cents and at Savannah 19 cents.

The Atlantic Refining Co. has advanced the price 1 cent to 19 cents a gallon in Pittsburgh.

The price of gasoline advanced another cent throughout Southern California to-day, now selling for 15 cents in Los Angeles where it sold for 11 cents but a few weeks ago.

Export Shipments Tied Up

—

Freight Congested—Use of Open Cars Advised to Alleviate Conditions

NEW YORK CITY, Dec. 7—The congestion of freight at this and other export shipping cities along the Atlantic Coast has caused much concern to the automobile traffic managers in Detroit and other cities. It is estimated that 65,000 cars are tied up at or near New York City alone.

On account of the present condition of affairs the traffic department of the National Automobile Chamber of Commerce has given its advice on how to alleviate this and to expedite shipments. By the shipment of automobiles in open cars instead of in the now much scarce closed cars, it is advised that the present scarcity of automobile equipment, will at least be relieved. It is stated that automobiles, passengers or freight, for export, can safely be shipped on open cars, and in fact a considerable proportion of the shipments have been made on such cars.

Another suggestion is made in the way shipments are made. Railroad officials have stated that many of the automobile factories are loading for export mixed carloads of automobiles containing machines for different countries and which have to be lightered to two or more steamship lines. This has resulted in delay to cars in which part of the lading is left over, and this has happened even when the same factory a few days later shipped a similar mixed lot. In other words, straight carload lots containing machines all for the same country or steamship line, should be planned.

The free time allowed on export shipments will be reduced from thirty to fifteen days by tariff publication effective Jan. 1, 1916. Automobile shippers should therefore forward only shipments for which ocean space is positively booked and assured.

—

$2,627,000 in Cars and Trucks from N. Y.

NEW YORK CITY, Dec. 6—Exports of automobiles, trucks, tires and parts during the week ending Nov. 20, from this city to the belligerent countries amounted to $2,627,000, divided as follows: Trucks, $1,479,000; automobiles, $574,000, and automobile parts and tires, $574,000.

—

Annual Tax for District of Columbia?

WASHINGTON, D. C., Dec. 6—An entire change in the method of assessments for taxation and operation of automobiles in the District of Columbia is proposed by the Commissioners in their report to Congress made to-day. The commissioners desire that instead of assessing automobiles as personal property and issuing a license tag that is good indefinitely, an annual license for the operation of such machines shall be charged in lieu of the personal tax. The proposed new legislation provides that on and after Dec. 31, 1916, all licenses, including identification tags and registrations for motor vehicles heretofore granted shall become void and on and after Jan. 1, 1917, there shall be charged annually for the licensing and registration of motor vehicles a sum to be fixed by the District Commissioners.

—

New Law for New York?

NEW YORK CITY, Dec. 8—As the result of a conference between Police Commissioner Wood, Secretary of State Hugo and Chief Magistrate McAdoo, a bill for regulating automobile traffic has been prepared for presentation to the Legislature.

It provides that all operators and owners of automobiles must obtain licenses from the secretary of state, who will have a corps of examiners. The secretary of state is given power to revoke licenses for violations of the traffic regulations, after a hearing, except in cities of the first class, where the power of revocation will rest with the police commissioner.

—

Iowa Owners Must Register Cars by April 1

DES MOINES, IOWA, Dec. 4—W. S. Allen, Secretary of State in Iowa, rules that only owners of automobiles who will not use their cars in 1916 will be relieved of the necessity of registering their machines before April 1. Penalties will be assessed for failure to register by that date. Under the old law automobile owners who did not intend to use their cars before June or July were not required to register their machines before that time but the new law requires registration before April 1 if the car is to be used at any time during the year.

—

Truck Speed Limit in Maryland

BALTIMORE, MD., Dec. 4—Harry A. Roe, motor vehicle commissioner for Maryland, has taken a decided stand against motor trucks and jitney buses. He has made an investigation and has found that the heavy trucks are going too fast and that the jitneys are being overcrowded. He has sounded a warning.

The speed limit for trucks weighing from 4 to 8 tons has been fixed at 15 miles an hour as the maximum, and those weighing over this amount at 12 miles an hour.

Bay State Bars Speed Runs

Dealers' Licenses Suspended for 1 and 2 Weeks—Highway Com. Issues Warning

BOSTON, MASS., Dec. 4—The license of the Donovan Motor Car Co., agent for Studebaker cars in Boston and vicinity, was to-day suspended for one week, and the licenses of Edward P. Sheehan, Boston, and Milton W. Reed, Lynn, Mass., were suspended for two weeks as an aftermath of the recent 1000-mile reliability run of the Studebaker car here. It is the first time that the license of any dealer has been suspended, and this drastic action is taken so that other dealers may be warned against holding such tests in the future.

The Highway Commission has served warning that hereafter any participants in reliability runs in which speed is a factor will be dealt with very severely. The action was a surprise to the Boston dealers, and it will be very amazing to others throughout the State. While the present motor vehicle law does not put a limit on the speed of a driver, merely saying that he must drive at a speed reasonable and proper, according to traffic conditions, there is another section that has a bearing on the case. This section has a clause reading:

"Whoever . . . operates a motor vehicle for the purpose of making a record and thereby violates any provisions of sections 16 and 17 of this act, etc., shall be punished by a fine of not more than $200 or by imprisonment for a term of not less than two weeks nor more than two years, or by both such fine and imprisonment."

To Stop Speed Tests

Sections 16 and 17 refer to speed regulations. While neither of the drivers was in court, the Highway Commission has the authority to deal with cases like theirs, and as the feat of the car got such wide publicity the members of the commission decided it was time to call a halt on future tests. The commission received a number of letters about the run and so it summoned the drivers and Mr. Donovan before it for an investigation before it acted. The commission issued the following statement:

"The Massachusetts Highway Commission to-day suspended for a period of two weeks the licenses of Edward P. Sheehan of Boston, and Milton W. Reed of Lynn because they operated an automobile for the purpose of making a record; and it also suspended for a period of one week the dealer's registration certificate of the Donovan Motor Car Co., Boston, the owner or concern in control of the automobile in question.

"It appeared from newspaper accounts that on Nov. 10, 1915, a Studebaker car was operated upon the highways of Massachusetts and adjoining States at an extremely high rate of speed. A hearing was given by the commission today, at which it appeared from the testimony that the car was operated under orders of the manager of the Studebaker company for the purpose of making an endurance record, and that an average speed of more than 30 miles an hour was maintained for the greater part of the distance.

Contrary to Law

"Such use of the highway is contrary to law, which prohibits the operation of automobiles on the highways for the purpose of making a record; and the commission desired to take this occasion to call the attention of all automobile agents and operators of motor vehicles to the fact that no automobile tests, records or races will be permitted on the highways of this commonwealth.

"As this is the first case of this kind that has been called to the attention of the commission, it has made short suspensions, because the parties were somewhat ignorant of the law and of their rights in the premises, and the commission feels that the parent corporation was more responsible than the operators or agent, who were acting under orders of the parent company.

Warning for Future

"The commission hopes that the newspapers will give this case full publicity, so that the public will have full notice of it, and of the fact that future cases of this kind will not be dealt with as leniently."

—

Booth Resigns from Chalmers

DETROIT, MICH., Dec. 7—C. H. Booth, who was a district sales manager for the Chalmers Motor Co. has resigned. No successor has as yet been named. The territory of Mr. Booth included the States of Michigan, Ohio, Indiana, Kentucky.

—

Link Joins Wilson Truck

DETROIT, MICH., Dec. 4.—Vincent Link has been appointed designing engineer of the J. C. Wilson Co., this city, manufacturer of Wilson trucks. He was formerly with the Packard Motor Car Co.

—

Keller a Maxwell Supervisor

DETROIT, MICH., Dec. 7—W. H. Keller has been appointed supervisor of zone "C" by the Maxwell Motor Sales Corp. His headquarters will be located in Pittsburgh.

Full Measure in Bay State

To Prosecute Makers and Dealers Where Liquid Containers are Under Size

BOSTON, MASS., Dec. 4—Thure Hanson, commissioner of weights and measures for Massachusetts, has started out to make dealers in oils and other liquids used in the motor industry give full capacity to their customers. He has been investigating quietly for some time into all kinds of oils and liquids used in cleaning and preserving parts of automobiles. His investigators have found discrepancies in the weighing and measuring which can be traced back to the manufacturers.

A large portion of the cans tested were short by from 1 to 4 fluid ounces. These discrepancies make considerable difference in the cost of the material and the loss to the buyer in some instances was as high as 14 cents a can. So Commissioner Hanson declared that he has decided to follow up this line of investigation and make prosecutions. He does not intend to prosecute the retail dealer at first, but will notify him not to sell under weight products.

The manufacturer will be notified to give full measure or he will be prohibited from selling his goods in Massachusetts. The commissioner says that he estimates that the buyers lose from $25,000 to $50,000 a year on these underweight products. Notifications have been sent to some producers already.

—

L. P. C. May Pay All Debts

RACINE, WIS., Dec. 4—Under an arrangement effected by creditors of the L. P. C. Motor Co., Racine, Wis., which made a voluntary assignment some time ago, it is believed that all debts will be paid in full and the business rehabilitated without the loss of a cent to creditors. As was announced at the time of the assignment, the company practically closed a large contract for cars and similar material. The Corliss Steel Co. of Racine has been organized by F. Lee Norton, the assignee; Capt. William Mitchell Lewis, president, L. P. C. Motor Co., and Herbert F. Johnson, to handle this contract as well as take over the business of the L. P. C. and assume the liabilities. It is proposed to use a large part of the former plant of the defunct Wisconsin Engine Co. at Corliss, Racine County, to which location the L. P. C. shops will be moved within a short time. The Corliss Steel Co. is licensed to do business on a broad scale in cars, tractors, machinery, etc.

Reliance Takes Over Seager Works

Engineering Co., Controlled by Lansing Men, to Make Automobile Parts

LANSING, MICH., Dec. 2.—The merger of the Seager Engine Works and the Reliance Engineering Co. is now an accomplished fact. Negotiations had been pending for several weeks, as was briefly reported in THE AUTOMOBILE for Nov. 11. The deal just completed, whereby the Reliance company takes over the Seager works, also means that the Rumely Co. ceases to have any connection with the new organization.

The officers of the Reliance company now are: C. P. Downey, president; Fred. L. Smith, vice-president; E. C. Shields, secretary; J. H. Wilford, treasurer. These officers and Henry Russell, John M. Stalker and B. F. Davis, form the board of directors. Lansing men now control the company.

Besides continuing to make gas engines, the reorganized company is expected to make ultimately the manufacturing of automobile parts its principal business. The machinery of the Reliance company is being removed to the Seager plant which covers about 18 acres of ground and whose tangible assets were estimated at $1,500,000. It will take some time yet to readjust all matters so that production will be at its maximum, but men are being added as fast as it is possible to get skilled workers.

Burd Ring in New Plant

ROCKFORD, ILL., Dec. 4—The Burd High Compression Ring Co. has moved into its new factory at Twenty-third Avenue and Tenth Street, this city. The new plant is 190 by 129 ft., having 19,000 sq. ft. available for manufacturing purposes. It is capable of turning out 25,000 piston rings per day and of employing 250 men.

New Plant for Gile Tractor

LUDINGTON, MICH., Dec. 1—The Gile Tractor & Engine Co. is to have a new plant, a one-story building, 200 by 40 ft., which will be connected with the present plant by a 20-ft. driveway. There are eighty men now on the company's payroll. When the new plant is ready at least 200 men are to be added.

McLaughlin to Double Output

OSHAWA, ONT., Dec. 3—At the annual meeting of the McLaughlin Motor Co., R. S. McLaughlin was elected president. Vice-president is C. Hezzelwood, treasurer G. W. McLaughlin and secretary G. W. Hezzelwood. Directors are: R. McLaughlin, Charles W. Nash and Thomas Neal. The action of the directors in selling the stock of carriage parts to the Canada Carriage Co. of Brockville was confirmed, as was also the building of a large addition to the plant.

It was decided that the output of the plant should be more than doubled during 1916 to keep pace with the increased demands.

Mason Plant Nearly Finished—1000 More Men

FLINT, MICH., Dec. 3—The new plant of the Mason Motor Co., which makes the motors for the Chevrolet Motor Co. of Michigan, and is controlled by it, is nearly completed and that part of it will be operated within a few days.

Men are being added as fast as it is possible to accommodate them, and by next April at least 1000 will be added to the force at the Mason plant alone. At the Chevrolet car plant it is expected to add 500 or more, and this would be done at once if enough houses were available in the city.

Pending the construction work of the new factory buildings the Chevrolet company has been using parts of the plant of the Monroe Motor Co., also the plant of the old Standard Rule Co. Arrangements have been made whereby the occupancy of these premises or parts of them will be continued idefinitely.

It was also announced to-day that William C. Durant is now president of the Chevrolet Motor Co. of Delaware, recently incorporated. The officers of the three Chevrolet companies are now as follows:

Chevrolet Motor Co. of Delaware—holding company, capitalized at $20,000,000: William C. Durant, president; A. B. C. Hardy, first vice-president; E. R. Campbell, second vice-president; W. C. Sills, treasurer; J. T. Smith, secretary. Board of directors, R. L. Higgins, chairman; L. G. Kaufman, H. M. Barksdale, N. Hofheimer, J. W. Prentiss, B. Lockwood and the officers of the company. Mr. Kaufman is chairman of the finance committee.

Chevrolet Motor Co. of Michigan: C. M. Begole, president; William C. Durant, first vice-president; A. B. C. Hardy, second vice-president; W. S. Ballinger, treasurer; C. R. Hathaway, secretary. Directors—the officers and A. G. Bishop and E. R. Campbell.

Chevrolet Motor Co. of New York: William C. Durant, president; W. C. Sills, vice-president; E. R. Campbell, secretary-treasurer.

Grinnell Electrics Discontinued

DETROIT, MICH., Dec. 1—The Grinnell Electric Car Co., which started in business in 1910 and made the Grinnell electric, has discontinued its manufacture.

Chevrolet Factory for K. C.

Assembling and Storage Plant To Be Built—Another in St. Paul

ST. LOUIS, MO., Dec. 2—Reports from Kansas City, Mo., that the Chevrolet Motor Co. plans to erect an assembling plant in that city were confirmed here to-day by Russel E. Gardner, Jr., vice-president of the St. Louis Chevrolet Co. Mr. Gardner added, however, that while the Kansas City branch will supply only the trade in the Kansas City district, the St. Louis factory will be the center of Chevrolet activities in the Middle West.

Chevrolet Plant for St. Paul

ST. PAUL, MINN., Dec. 4—The Chevrolet Motor Car Co. will erect a four-story steel and brick storage and assembling plant to cost $500,000 at University and Emerald Avenues, near the Minneapolis boundary line. The site is near those of the Overland and Twin City Four Wheel Drive plants. It has a frontage of 264.14 ft. and a depth of 503 ft.

Republic Brass Co. Organized

PONTIAC, MICH., Dec. 2—The Republic Brass & Bronze Co. has been formed here. It has a capital stock of $25,000, of which $13,000 has been paid in cash. The plant of the Pontiac Motor Castings Co. has been purchased by the new company. Under the supervision of general manager A. C. Sheerer, the plant is being repaired and remodeled. All kinds of brass, bronze and aluminum castings will be made.

Exhaust Heater Co. Formed

GRAND RAPIDS, MICH., Dec. 3—The Auto Exhaust Heater Co. has been organized to make a device to be used for heating automobiles in cold weather. Those interested in the new concern are: Don McAfee, Frank Veit, T. Johnson, Frank Mathison and Neil Kunst.

Ford's Son in Charge

DETROIT, MICH., Dec. 3—A young man of 22 is to-day at the head of two automobile manufacturing concerns, whose total business during their 1915 fiscal year aggregated over $100,000,000. This young man is Edsel B. Ford, son of Henry Ford.

Young Mr. Ford has been given full power of attorney by his father and during the latter's absence, which will be from five to six weeks, it is said, he will be the president of the Ford Motor Co., Detroit, the Ford Motor Co. Ltd. of Canada and the new firm, Henry Ford & Son, Dearborn, Mich., which is to build the tractors.

At the close of the business day yesterday the Ford company had orders on its books for immediate delivery for 105,289 cars, which, however, does not include cars to be shipped this month. In other words, this represents the number of cars ordered but for which the company is behind on deliveries. Since the beginning of the 1916 fiscal year, or since Aug. 2, approximately 140,000 Fords have been made and shipped. This represents the production and shipments from all the assembling plants throughout the country in addition to the activities of the parent plant here.

Ford Buys Brooklyn Land

DETROIT, MICH., Dec. 4—The Ford Motor Co. has purchased a plot of ground on the Eastern Parkway, near Bedford Avenue, Brooklyn, N. Y., where a new service station and assembling plant will be erected to take place of the service station and branch now located at 1476 Bedford Avenue. The new building will be of irregular shape, three stories high, with basement.

In Scranton, Pa., the Ford company will put up a new branch. The three-story structure will be 175 by 90 ft.

Myers Machine Co. Adds

SHEBOYGAN, WIS., Dec. 4—The Myers Machine Co., Sheboygan, Wis., which has been reincorporated and capitalized at $50,000 to include the plant and business of the Wisconsin Motor Truck Co., Baraboo, Wis., has awarded contracts for the erection of a 75 by 75 ft. shop addition to accommodate the truck shop. The line will consist of 1500-lb., 1-ton and 2-ton worm driven trucks. Police and fire cars will be made to order. The Myers company is now buying the new equipment needed.

Gillette Tire Starts Factory

EAU CLAIRE, WIS., Dec. 4—Work has been started by the Gillette Safety Tire Co., formerly of Grand Rapids, Mich., on the first unit of its permanent factory and offices here. The building will be of reinforced concrete construction, 60 by 250 ft., located on a tract 150 by 300 ft. and placed so that wings may be constructed as needed. The initial output will be 100 tires daily, and the concern is engaging seventy-five tiremakers and twenty-five apprentices. The company is capitalized at $1,000,000 and has been in existence two years.

Jaeschke Foundry To Expand

MILWAUKEE, WIS., Dec. 4—The Jaeschke Bros. Foundry Co., 3026 Locust Street, Milwaukee, is building a new foundry and pattern shop at Cawker Place, Thirtieth Street and the Milwaukee road tracks. It will be of brick, one-story, 120 by 150 ft., of modern design throughout, and will cost $20,000.

Niles Co. To Build Trucks

Interurban Car Manufacturer Will Turn Out General Delivery Type

NILES, OHIO, Dec. 4—The Niles Car & Mfg. Co., which has been confining its attention to the manufacture of interurban cars, will soon turn out motor trucks for general delivery purposes, according to an announcement made recently. The matter had been under advisement for some time by the directors of the company and because of the fact that an amendment must be made in the charter of the corporation, a stockholders' meeting has been called.

Packard to Build 12,000 Cars

ST. LOUIS, MO., Dec. 7—The Packard output for 1916 will be 12,000, an increase of 4500 or 60 per cent over 1915, according to H. H. Hills, general sales manager of the parent company, at a meeting of Middle West dealers here to-day. Dealers from twenty-four leading cities met the factory officials and exchanged views as to delivery, output and service possibilities for 1916.

Moline Plow Buys Cultiplow

COLUMBUS, OHIO, Dec. 7—The Moline Plow Co. has purchased the manufacturing rights for the Universal Cultiplow heretofore produced by the Universal Tractor Mfg. Co., though it has not taken over this company. The Universal company will discontinue. F. B. Funk is engineer and factory manager of the tractor department of the Moline Plow Co., and S. C. Turkenkoph will be assistant to the sales manager of all departments and the company's tractor expert. The Moline company will build trctors on a much larger scale than possible by the Universal Tractor Mfg. Co.

Firestone Plans More Additions

AKRON, OHIO, Dec. 4—Permits have been taken out by the Firestone Tire & Rubber company for four new buildings to enlarge its plant. Two of the buildings will be five stories high and the others one story. The cost of the structures is estimated at $75,000.

Midland Supply Succeeds Positive

DAVENPORT, IOWA, Dec. 4—The Positive Supply Co., this city, has been dissolved and the business will be continued under the name of the Midland Supply Co. with which it has been consolidated. In the consolidation W. G. Sanford, formerly president of the Positive company becomes vice-president of the Midland organization, J. Reed Lane, president and Maurice Hemsing, secretary and treasurer.

The consolidation does not affect the sales force, business policies or contracts now in force of the Positive Supply Co., which has been marketing a steam vulcanizer for several years, together with several accessories.

356 Studebakers in 1 Day

DETROIT, MICH., Dec. 6—The Studebaker Corp. broke its one day production record Nov. 27, when 356 cars were made or nine more than the former high mark.

DETROIT, MICH., Dec. 4—The plant of the Studebaker Corp. at West Jefferson and Clark Avenues, will be greatly enlarged, and a first permit for a steel frame and concrete addition, to cost $35,000 has been secured from the building department.

Jeffery Adds Two Buildings

KENOSHA, WIS., Dec. 4—The Thomas B. Jeffery Co., Kenosha, Wis., has started work on two large factory buildings, each three stories high, to provide much-needed production facilities in both passenger and commercial car departments. The company has been working night and day for many months and is at this time employing 2500 men, compared with 1300 on the payroll a year ago.

Vim Starts New Plant

PHILADELPHIA, PA., Dec. 4—The Vim Motor Truck Co. has started work on its new six-story concrete factory building at Twenty-third and Market Streets. The building will cost about $750,000. It will be completed in the spring, covers a lot 200 by 400 ft. and will contain 64,000 sq. ft. on each floor.

General Tire Moves to Akron

KANSAS CITY, MO., Dec. 3.—The Western Tire & Rubber Co., formerly of this city, has moved its plant to Akron, Ohio, where it is incorporated under the name of the General Tire & Rubber Co., with a paid-up capital stock of $200,000. The personnel of the company will remain the same. Equipment is being installed in the new 60 by 160 ft. plant.

Knox Strike Settled

SPRINGFIELD, MASS., Dec. 7—The machinists strike at the plant of the Knox Motors Co., this city, which lasted for a few days, has been settled to the satisfaction of both the Labor Union and the company.

Kundtz Strike Ended

CLEVELAND, OHIO, Dec. 4—The strike of 1800 workmen at the plant of Theodore Kundtz, maker of automobile bodies and parts, was settled to-day, having lasted over a month.

Commerce Truck Gains 150%

To Double Capital—1915 Earning May be $70,000—Stock Dividends Probable

DETROIT, MICH., Dec. 4.—At a meeting of the board of directors of the Commerce Motor Car Co., manufacturer of the Commerce trucks, it was decided to increase the capital stock of the company from $100,000 to $200,000. A meeting of the stockholders will be held Dec. 14, at which they will be asked to decide whether a stock dividend of 50 per cent, as recommended by the directors, be paid to stockholders of record Dec. 15. The earnings of the company are expected to total about $70,000 this year, which is 70 per cent of the former capital stock. It is not likely that cash dividends will be paid for some time, but, it is possible that another stock dividend of 33 1/3 per cent will be paid early next year.

The Commerce Motor Car Co. started in business in 1910 and has been making trucks only. This year its business has been exceptionally good. According to the officers of the company its sales have been 150 per cent better than during any previous year.

—

Denby to Increase Stock $500,000 to $750,000

DETROIT, MICH., Dec. 4—The Denby Motor Truck Co., has decided to increase its capital stock from $250,000 to $750,000, of which $500,000 will be common and the balance of $250,000 will be preferred. The present capital is all common. None of the new stock is to be placed on the market, and, it is said that it is being subscribed for directly at par, while a common stock bonus estimated at 65 or 70 per cent is being given with the sale of all preferred. The entire matter in connection with this increase of capital of the Denby company has been done quietly and it is said that the greater part of the new stock has been subscribed for by the present stockholders, President Garvin Denby and his brother Edwin, who is treasurer of the company, having it is said, a majority of the stock.

The Denby company started in business in July, 1914, and its business has been gradually increasing until it has become necessary to increase the capital stock and provide for greater production facilities. The plans for the contemplated increased activities of the company are not completed.

—

Sales Record for Jeffery Quad

KENOSHA, WIS., Dec. 6—The Thomas B. Jeffery Co. made a record in sales and production when it was announced that over 2000 Jeffery Quads of 2 tons or over, were built, bought and delivered.

The company has set aside the month of December as Quad Month. During this month demonstrations are being carried on by its dealers in practically every part of the world.

—

Aluminum Lower

NEW YORK CITY, Dec. 7—Market prices this week were subject to many changes. A number of the metals were lower, especially copper, tin and aluminum. Rubber, after an 8-cent drop last week, fluctuated throughout the week, but managed to hold at the 70-cent mark, 2 cents higher than the opening price on Tuesday. The copper market was quiet with prices prevailing at 19½ cents a pound. Tin weakened in price on account of the arrival of a large shipment of that metal from London. Quotations prevailed at $38 per 100 lb., or $1.75 lower. Aluminum has dropped to 56 cents with an easy market. Lead is now quoting at $5.22½ per 100 lb. Rubber from Ceylon is quoting at 85 cents with a light inquiry from the manufacturers. Bessemer steel and open-hearth steel rose $1 and $2, respectively per ton or to $29 and $30 per ton, respectively.

Pennsylvania crude petroleum rose to $2.10 a barrel on Friday. Rapeseed oil rose to 87 cents; linseed oil dropped 1 cent to 62 and cottonseed oil rose 25 cents to $8.34 a barrel. Cyanide potash rose 5 cents to 28 a pound. The rest of the oils and lubricants remained unchanged.

—

Federal Business Gains 25%

DETROIT, MICH., Nov. 27—While this time of the year was always dull with the Federal Motor Truck Co., this year business has been uninterruptedly good and there has been no sign of a dull season. The output for 1916 will go at least 25 per cent better than double the 1915 output. Work on the additions to the plant is progressing rapidly. Federal dealers and distributors have been sending in most optimistic reports as to their business outlook. The company will help its dealers more than ever and has appropriated more money than heretofore for advertising purposes.

—

Briscoe and Argo Buy Jackson Motor Parts Co.

DETROIT, MICH., Dec. 8—*Special Telegram*—The Briscoe Motor Co. and its affiliated concern, the Argo Co., have purchased the Jackson Motor Parts Co., which is a machine shop to do work for both Briscoe and Argo concerns. The machinery which was in the plant formerly occupied by the defunct Mason Motor Co. at Waterloo, Iowa, has also been purchased and is now in the plant of the Jackson Motor Parts Co. This deal gave rise to report that Briscoe intended operating a plant at Waterloo. Frank Briscoe confirmed the report that the Swift interests of Chicago some time ago secured a large interest in the Briscoe and Argo companies, but he refused to give details.

—

Moore with Service Truck

WABASH, IND., Dec. 4—Paul Moore has been appointed advertising manager of the Service Motor Truck Co., Wabash, Ind. He comes from the advertising department of the Weis Fibre Container Corp., Monroe, Mich., and was formerly connected for three years with the advertising department of the National Cash Register Co.

—

Hupp Re-Financing Approved

DETROIT, MICH., Dec. 3—The stockholders of the Hupp Motor Car Co. have approved the plan of refinancing and extension, which was reported in THE AUTOMOBILE for Nov. 25, whereby the assets and business of the Hupp company are taken over by the Hupp Motor Car Corp., incorporated under the laws of Virginia.

Tire Scrap	.05¼	.05½	.05¼	.05¾	.05¾	.05¾	+ .00½

The control of the organization has been obtained by the old stockholders, and the officers of the corporation are: J. Walter Drake, president; Joseph R. Drake, vice-president and secretary and Edwin Denby, treasurer.

The capital stock of the corporation is $8,000,000, of which $5,000,000 is common and $1,500,000 preferred. The balance of authorized stock or $1,500,000 was made necessary by the fact that the preferred stock is convertible into common stock at par and as long as the preferred stock is out an equal amount of common stock must be in the treasury. Thus, while the total capitalization is $8,000,000 the working capital is $6,500,000.

S. T. Davis Estate $261,645.33

BRIDGEPORT, CONN., Dec. 4—Samuel T. Davis, Jr., late president of the Locomobile Co. of America, had an estate worth $261,645.33 according to a report filed by appraisers appointed by the court.

The greater portion of the estate consists of Locomobile stock, 1165 shares of preferred worth $58,250 and 5115 shares of common worth $51,160. The other large amount contained in the report is a life insurance policy worth $103,024.61.

Dividends Declared

Rubber Goods Mfg. Co.; quarterly of 1¾ per cent on preferred, payable Dec. 15 to stock of record Dec. 10.

American Can Co.; quarterly of 1¾ per cent on preferred, payable Jan. 1 to stock of record Dec. 16.

Kelly-Springfield Tire Co.; quarterly of 1½ per cent on 7 per cent second preferred, payable Jan. 3 to holders of record Dec. 15.

Automobile Securities Firm

General Motors Reaches High Mark of 530—Ajax-Grieb Common Goes Up 25

NEW YORK CITY, Dec. 8—Automobile stocks were yesterday under pressure owing to the direct application of some feature of the President's taxation proposals to them. The proposed tax of 1 cent per gallon on gasoline and naphtha is calculated to affect the profits of automobile companies. In the same way the tax of 50 cents per horsepower will add to the cost of these articles. The net effect of the message was to lower General Motors 9 points for the day. Maxwell Motors, on the other hand, finished at a net gain of ½ point from Monday's final quotation, though at a loss of 2½ points from the high figure of the day. Willys-Overland was an exception. It ended at 246, the high figure, representing a net gain of 6½ points for the day.

General Motors made a new high mark of 530, Monday, gaining 37½ points for the day. The preferred closed at 123½, over 6 points higher than Saturday's quotations. Goodrich was a strong feature Monday at 75½. Some activity was also shown in U. S. Rubber to the accompaniment of reports that both companies had laid in a large supply of crude rubber prior to the advance in the price of that commodity.

Ajax-Grieb common closed on Saturday at 375, or 25 points higher. Chalmers common made a 5-point gain, closing at 150. Electric Storage Battery, which has shown little activity, came to the fore last week with a 1⅛ point rise. Packard common, which has been showing much activity, rose 5 points, while its preferred went up 1 point. Peerless Corp. stock rose 2½ points.

A number of drops occurred in the tire issues. Firestone common, which has been holding strong at 700, declined 10 points. Goodyear common and preferred went down 8 and 1 point, respectively.

The Detroit quotations were featured by a 17½ point rise in General Motors which reached the 460 mark. With the exception of a 9-point rise in Packard common, the rest of the stocks showed small changes.

Clifton Guest at N. A. C. C. Lunch

DETROIT, MICH., Nov. 30—At to-day's luncheon of the Board of Commerce, Charles Clifton, president of the National Automobile Chamber of Commerce, Inc., and treasurer of the Pierce-Arrow Motor Car Co., Buffalo, N. Y., was the honored guest and speaker. About 250 prominent men in the automobile industry, not only from this city, but from other States, listened to Mr. Clifton's talk on Co-operative Competition.

Pa. Chauffeurs Are Domestics

PHILADELPHIA, PA., Dec. 4—At a recent meeting of the Workmen's Compensation Board, which will carry out the provisions of the new Pennsylvania act, it was ruled that ordinary private chauffeurs are engaged in domestic service and therefore do not come within the meaning of the act.

France Opens Tractor School

To Instruct Farm Workers in Handling and Caring for Motor Implements

PARIS, Nov. 24—France inaugurated its first agricultural motor school this week at Herblay, about 20 miles to the north of Paris. Since the outbreak of war there has been a radical change in French agricultural methods, the shortage of horse, the lack of men, and the destruction in certain regions of all agricultural instruments having decided farmers everywhere to change from horse to mechanical traction. This movement has been accentuated by the government scheme under which substantial subsidies are offered toward the purchase of agricultural tractors and motors, and the assurance that by 1917 denaturized alcohol will be a cheap national motor fuel. The end of the war will find the whole of the farms in the north and northeast of France in a devastated condition. As the State will provide funds for reconstruction, it is obvious that farmers will be open to take the most modern equipment.

The school just established seeks to instruct farmers and farm workers in the handling and maintenance of various types of agricultural tractors. A large amount of land is available for practical work in the fields, but great importance is attached to repairs and general workshop instruction. The usual farm buildings have been converted into workshops equipped with forge, drill press, lathe, grinding machine, and a good collection of tools. It is intended that the farmer who goes through the course shall be capable of carrying out all mechanical repairs in the maintenance of a fleet of tractors.

The demonstration machines are all of American construction. They comprise a twin-cylinder three-wheel Bull tractor; the Twin-City three-wheel tractor; the twin-cylinder Bijou; the four-cylinder Bullock caterpillar tractor, and the Aultmann & Taylor 60 hp. tractor. The first four machines were demonstrated on the inauguration day, and all of them being suited to local conditions attracted favorable comment. The fifth machine has not the same general application on French farms and was not brought out.

—

Plan Tractor Demonstration

MADISON, WIS., Dec. 4—A demonstration and exposition of farm tractors will be conducted on the farm of the college of agriculture of the University of Wisconsin near Madison during the summer of 1916. It will be the first event of the kind to be held in Wisconsin. The promoters include the college of agriculture; Madison Chamber of Commerce; the agricultural newspapers of the State; the country newspapers of Wisconsin, and the association of farm tractor manufacturers. Rules and regulations to govern the demonstration are now being formulated by the Society of American Agricultural Engineers, of which F. M. White, Madison, is secretary. It is expected that at least thirty-five tractor builders will participate in the tests.

Fined $500 for Speeding

ST. LOUIS, MO., Dec. 2—The police and court campaign against speeders and careless automobile drivers reached a climax here to-day when one police judge fined Wallace M. Allison, a nineteen-year old service car driver, $500 for speeding and another jurist fined Edwin Bolles $250 for running down and injuring a passenger alighting from a street car.

About the same time a warrant charging violation of the State law against careless driving was issued against John Hagen, another service car driver.

—

Electric Makes Hartford-Washington Trip in 3 Days

HARTFORD, CONN., Dec. 4—A. E. Parsons, general manager of the Detroit Electric Car Co. of Connecticut delivered on Wednesday of this week to Congressman and Mrs. P. Davis Oakey of Hartford, Conn., a Detroit electric brougham at Washington, D. C. Mr. Parsons made the trip from Hartford to Washington unaccompanied, a total distance of 372½ miles, in three days or 21½ hr. of actual running time. He started from *The Times* office in Hartford, where he was checked out at 8.55 Monday morning.

—

Sue Detroit Speedway

DETROIT, MICH., Dec. 7—A suit was filed to-day in the Wayne county circuit court against the Detroit Motor Speedway by Butler & Toy, representing sixty workmen employed by the latest contractor to build the speedway. The men assert that over $3,000 is coming to them, having received only 2 weeks' pay.

In the bill of complaint the following officers, directors, contractors and parties to the purchase of land have been named by the claimants:

John B. Whelan, president; Selden D. Maddux, vice-president; Robert B. Swart, secretary; Albert Hartenstein, treasurer; William L. Wild, Albert Pudrith, Ralph M. Tate, Philip Breitmeyer, directors. Frank G. Smith, George F. W. Reid and Samuel Vreeland are named as parties to the land purchases of the company. Michael J. McCarthy, Denny Bush, John Hagerty, Wilfred F. Raymond and Wilfred Rackemann, alias John Doe, are named as principals in contracts for construction of the speedway.

New Gasoline Rules in Minn.

67 Inspectors Are Instructed to See That Dealers State Gravity of Fuel

ST. PAUL, MINN., Dec. 4—New rules have been put out by the State fire marshal for use, handling, storage and sale of gasoline in Minnesota. Gasoline must be kept in 60-gal. cans, when kept outside a building, under fireproof cover; in 200-gal. lots if within a building utilized for no other purpose; and in 600-gal. lots if in a metal tank of not less than 14-gage galvanized steel. Sealed portable filling tanks of not more than 60 gal. capacity may be used inside garages, but these tanks must be of not less than 7-gage steel supported on wheels. The body of the tank is not to be less than 6 in. from the floor and must be provided with an approved pump.

Sixty-seven assistants of the Minnesota oil inspector have been instructed to see that dealers in gasoline state the gravity of the liquid on placards in full view of customers.

—

New Setting for Palace Show

NEW YORK CITY, Dec. 6—An original setting, quite different from that of other years has been conceived for the 1916 national show, which opens in the Grand Central Palace on New Year's Eve. Manager S. A. Miles says the interior of the building is to be "The Palace of Motoria."

Motoria is the goddess who watches over the automobile industry and who, visualized in statuary, has graced a number of automobile shows in the past. She stands aloft with hands outstretched upon the steering wheel, her draperies blown by the breeze.

In general aspect the interior will be a combination of 25,000 yd. of maroon velvet festooned in deep blue and gold with the marble Corinthian and Doric Columns. Illumination will be from large electroliers, each of which has eighteen balls of fire inclosed in frozen glass with glass of other hues to give a touch of color. On the main floor tubular electric signs will be used to show the name of each car, as at last year's show.

—

Dodge Contract for Van Speedometer

ELGIN, ILL., Dec. 6—Contracts for supplying 100,000 speedometers for the 1916 output of the Dodge Bros. automobile plant, have been signed by the Van Sicklen Speedometer Co., this city. This contract in addition to others made with

the Mercer and New Era company, will necessitate doubling the production. It is planned to turn out 750 speedometers per day during the coming year. Fourteen different companies are now being supplied with speedometers for their cars. At present 225 persons are employed. This number will be doubled. Because of the extensive manufacture of war material in this country, the company is meeting with difficulty in securing tools.

—

387 Dealers Celebrate Harry Newman Day in Milwaukee

MILWAUKEE, WIS., Dec. 4—The most elaborate introduction of a new agent or distributor to the Wisconsin territory was the celebration of Harry Newman Day here on Friday, Dec. 3, when Harry Newman, Inc., Chicago, Ill., formally made his bow to Wisconsin, Upper Michigan, Southern Minnesota and Eastern Iowa as representative of the Chalmers Motor Co., Detroit, and succeeded in placing the allotment of 1250 Chalmers cars.

Visitors were taken in hand as soon as they stepped from the trains. New Chalmers sixes whisked them up Grand Avenue to the Newman garage at Seventh Street. The registration of dealers at the garage was 387.

Friday evening Mr. Newman gave a banquet at the Hotel Pfister to the visiting dealers, members of the Milwaukee Automobile Dealers, Inc., prominent city and State officials and members of the press. The guest of honor was Hugh Chalmers, who came from Detroit with Frank C. Willys, assistant manager of sales, for the occasion.

—

Large Sales at El Paso Automobile Week

EL PASO, TEX., Dec. 4—Visitors to El Paso from all parts of the Southwest, the home people, the dealers and everyone else are delighted with the entertainment and success that attended the carrying out of the idea of devoting a week to show-room displays of automobiles, trucks and accessories. It was known as El Paso Automobile Week, and the program was brought to a close Nov. 27. Instead of concentrating the exhibits in a single showroom, it was decided to have each dealer make an individual display at his regular place of business. The plan met with favor and brought about a spirit of rivalry between the different dealers that probably produced better results from a display standpoint than had all of the exhibits been thrown together under one roof. Throngs of people visited the city during the course of the week for the special purpose of viewing the exhibits and dealers report a large business as a result of the unusual attractions that they had to offer the callers. Nearly forty-five dealers in automobiles and accessories were represented.

—

Army Wants 27 Trucks

WASHINGTON, D. C., Dec. 4—In the estimates that will be submitted to Congress at this session by the War Department will be one for the purchase of twenty-seven motor trucks and one supply truck for an army motor truck company. This truck company will be assigned to a division and will be operated largely on good roads along lines of communication between the troops and the base of supplies. The motor truck of 80,000 lb. against 75,000 lb. for divisional wagon trains.

—

Apelco Electrical Units in Demand

NEW YORK CITY, Dec. 7—Since the publication of the list of starting and lighting systems used on the principal cars of 1916, which appeared in the last issue, we have been informed that the Apelco equipment will be used by several more companies than those listed. Pullman and Mitchell will have Apelco apparatus on some of their models and it will also be found on Arbenz, Briscoe, Cameron, Elkhart, Herff-Brooks, Hollier, Sphinx, Richmond and Wayne cars.

Ignition System Improved in Detail

(*Continued from page* 1047)

Dixie magnetos operate on what is known as the Mason principle. The rotating shaft passes through the magnet poles instead of between them and instead of carrying an armature on which the windings are placed, the shaft carries two solid polar extensions separated by a non-magnetic distance piece. Surrounding these revolving pole pieces is a light laminated field structure carrying a core. The core carries both the primary and secondary windings and the current is generated by sending magnetic lines alternately in opposite directions through the field structure.

Advance is secured by the fact that the field can be rocked through several degrees, the rocking being accomplished by turning the timer arm with the circuit breaker in the ordinary way to advance or retard the spark. By means of this positive connection between the field and the circuit breaker, it is possible to arrange the instrument so that the sparks are produced when the magnetic lines are at their maximum, thus breaking the circuit at the peak of the current wave.

In the circuit breaker, nothing moves except the cam attached to the shaft and by this construction it is possible to adjust the contact points while the motor is running. The grounding terminal is insulated at the end of the spring clip which holds the breaker cover in position and as it bears on the center of the cover. The ground wire is also stationary while moving the timer arm.

The four- and six-cylinder instruments are identical in every respect except the distributer and timing gears. In the eight- and twelve-cylinder model the shape of the rocking field and also the polar extension is changed so that four and six sparks can be produced per revolution. The whole instrument is featured by its compactness, the windings for instance, being remarkably small, being wound on a core of only ¾-in. by ½-in.

Simms for Fours and Sixes

The Simms Magneto Co. is concentrating on four- and six-cylinder magnetos and has brought out no new instruments for engines with a larger number. It has not been found necessary in these magnetos to change the breaker mechanism to meet increased speed demands, but refinements have been made for increasing the efficiency and life as well as the accessibility. All Simms magnetos have the extended pole shoes which have featured this make for some time past and which are designed to provide maximum sparks at low speeds.

These magnetos have a timing range of from 30 to 40 deg. crankshaft travel. On the four-cylinder motors, and 20 to 26.66 deg. for six-cylinder motors.

The Simms company has discontinued the manufacture of the so-called waterproof magneto, having found it undesirabl to inclose the magneto in the conventional manner. A tightly inclosed distributer board is relied upon to prevent short-circuiting. The models available for four-cylinder engines are SU4, SU4S, and SU4D. Four sixes SU6, SU6S and SU6G. Each type is furnished with single or double magneto. All these magnetos are true high-tension instruments, having double wound armatures. The SU4 is an independent machine which can be used for single ignition or in conjunction with a separate set or battery plugs; the SU4S has auxiliary apparatus for a vibrating spark dual system; and the SU4D uses a non-vibrating spark dual system.

Factory Miscellany

Automobile Woodwork Co. Adds—The Michigan Truck & Lumber Co., Holly, Mich., will erect a one-story addition, 70 by 76 ft. The company makes automobile woodwork.

Dry Climate Tire to Build—The Dry Climate Tire Co., Denver, Colo., plans to establish a branch plant at El Paso, Texas, for the manufacture of casings and inner tubes.

Mason Tire Secures Site—The Mason Tire and Rubber Co., Cleveland, Ohio, has secured a site at Kent, Ohio, and will construct a factory, the estimated cost being $60,000.

To Make Automobile Gates — The United States Auto Gate Mfg. Co., Tacoma, Wash., has filed articles of incorporation to manufacture automobile gates. A plant will be constructed in Sequim, Wash.

Motor Hearse Co., Doubles Capacity—The Michigan Hearse & Motor Co., Grand Rapids, Mich., maker of automobile hearses, is doubling its capacity by the erection of an addition to cost about $20,000.

Cleveland Ford Tire to Build—The Cleveland Ford Tire Co., Cleveland, Ohio, has awarded the contract for the construction of a two-story, 73 by 150-ft. plant at Ashtabula, Ohio. The estimated cost is $22,500.

Chicago Nut Co. to Build—The Chicago Nut Co., manufacturer of brass nuts, has awarded the contract for the construction of a two-story factory at 2513 West Twentieth Street, Chicago, the estimated cost being $38,000.

Pierce-Arrow to Add—The Pierce-Arrow Motor Car Co., Buffalo, N. Y., has let contract for the erection of a laboratory and experimental building, 50 by 90 ft., two stories, at its plant at Elmwood Avenue and New York Central Railroad Belt Line.

Chalmers Mechanical School Formed—A mechanical school has been established at the Chalmers Motor Co.'s Detroit plant by S. H. Humphries, vice-president in charge of manufacturing. Its purpose is to give a thorough mechanical education to Chalmers employees.

Denver Fuel Co. to Build—The Mountain Motor Fuel Co., Denver, Colo., expects to start building a new $40,000 plant next week on the site where its smaller plant was recently destroyed by fire and explosions. The new plant will have about twice the capacity of the old one, and will be equipped for refining and also for compounding lubricating oils.

Oakland Shipping Cars by Boat—The shortage of railroad freight cars has caused the Oakland Motor Car Co., Pontiac, Mich., to make most of its shipments during the last few weeks by road to Detroit and from there by boat to Buffalo, Cleveland and Toledo. From these cities shipments then went forward by the railroads.

J. B. D. Co. to Make Carbureters—J. B. Drahonovsky, who founded the J. B. D. Resilient Wheel Mfg. Co., 671 Smith Street, Milwaukee, has now organized the J. B. D. Carbureter Co. with $10,000 capital, to develop and market further inventions and designs in the automobile field. The new concern will occupy quarters with the Wheel company.

Motor Co. to Move to Oshkosh—The Lake Breeze Motor Co., Chicago, Ill., has filed a bond of $15,000 with the Chamber of Commerce of Oshkosh, Wis., to insure its removal from Chicago to Oshkosh. The company will be re-incorporated at once under the laws of Wisconsin, and C. C. Chase of Oshkosh, who takes a heavy financial interest, will be president. Factory quarters are now being provided in Oshkosh, and it is hoped that the company will be in shape to start actual production by March 1 or 15.

The Week in the Industry

Aument Resigns—E. W. Aument has resigned as superintendent of the Rock Falls Manufacturing Co., Sterling, Ill., to become general manager of the Michigan Hearse & Motor Co., Grand Rapids, Mich. The former company is also engaged in the manufacture of hearses and funeral cars. The Michigan company also manufactures its own chassis.

Changes in Hyatt Service Branches—The rapid extension of the service given by the Hyatt Roller Bearing Co., Newark, N. J., has necessitated several additions to the personnel of the various service branches.

L. R. Remington, formerly in charge of the Hyatt direct service branch at Atlanta, Ga., has been made service manager at Chicago, Ill. He will succeed J. R. Phillips. R. B. Campbell, recently manager of the service branch at Detroit, Mich., goes to Atlanta, Ga., to take charge of the work in that territory. J. W. Taylor, a new man in the Hyatt organization, has been named as service manager at Detroit.

—

Dealer

New Home for Abbott-Toledo—The Abbott-Toledo Co., Toledo, Ohio, will be situated at Madison Avenue and Thirteenth Street.

Ford Buys Brooklyn Site—The Ford Motor Co. has purchased a site on the Eastern Parkway and Bedford Avenue, Brooklyn, N. Y., on which a large structure will be erected. This building will be used as a showroom.

Firestone Tire Buys Brooklyn Bldg.—The Firestone Tire and Rubber Co. has purchased the building at the corner of Sterling Place and Bedford Avenue, Brooklyn, N. Y., now occupied by the Ford company. The Firestone company now occupies the building at 1197 Bedford Avenue.

Denver News Items—Tom Botterill, 1278 Broadway, Denver, Pierce and Hudson distributor for Colorado and Wyoming, and Dodge dealer for Denver and vicinity, is re-arranging his office and salesroom to provide for more show space for cars on account of closing his separate Dodge salesroom at 1530 Broadway and handling all three lines at the one place.

Mulnix & Rarie, Grant distributors for Colorado and Wyoming, with salesroom at 17 East Colfax Avenue, Denver, have opened a nearby Grant service station at 1431 Cleveland Place, with George Hale, formerly of the Grant factory, in charge.

Motor Men in New Roles

Mohler Pathfinder Production Mgr.—C. M. Mohler has joined the Pathfinder Co., Indianapolis, as production manager.

Schmidt Joins N. Y. Metz—W. L. Schmidt has joined the Robert Lurie Co., New York City, eastern distributor of the Metz, as secretary and treasurer.

Kelly Joins White—George Kelly, of the Baker R. & L. Co., Cleveland, has left that company and joined the White Co. He will devote his attention to truck sales.

Harrington, N. Y. Packard Sales Head—A. C. Harrington, for thirteen years a a member of the Packard forces, has been appointed sales manager of the Packard Motor Car Co. of New York.

Weimer to Form Wagner Station—Otto Weimer, who has been in charge f the Wagner Electric Co.'s exhibit at the Panama-Pacific fair, will shortly establish a service station in Portland, Ore.

Carey Goes to Portland—W. H. Carey, after resigning his position with the Kelly-Springfield Tire Co. at San Francisco, has come to Portland to take charge of the Portland agency, which is operated in conjunction with the Oregon Motor Car Co.

Griffin Maxwell Rep.—Jack Griffin, former Los Angeles newspaper man, has been appointed special Western factory representative of the Maxwell Motor Sales Corp., with headquarters at San Francisco, and territory embracing California, Oregon, Washington, Idaho, Montana, Utah, Nevada and Arizona.

Ruddle Los Angeles Mercer Mgr.—Jack Ruddle, a veteran of the automobile industry in Southern California, has been appointed manager of the Los Angeles retail Mercer house by George R. Bentel, who now controls the Mercer throughout the entire territory west of Denver.

Montgomery Pasadena Kissel Head—The Pacific Kissel Kar branch, with offices and salesrooms in Los Angeles and San Francisco, has opened a branch at 130 East Union Street, Pasadena. The Pasadena territory was formerly controlled by a sub-agent. J. H. Montgomery has been appointed manager of the new branch.

Gans New Studebaker Indianapolis Mgr.—E. W. Gans has been appointed manager of the Indianapolis district office of the Studebaker Corp. Mr. Gans, before his affiliation with the latter company, was for seven years with the White Co., where he held the position of southern manager.

Burt Joins Henney Buggy—R. M. Burt has taken a position as special representative with the Henney Buggy Co., Freeport, Ill., and will introduce the company's new line of commercial bodies for Ford chassis. The company recently decided to devote a large portion of the buggy plant to the manufacture of car bodies, the demand for horse-propelled vehicles falling off greatly of late years.

Atwood Makes Cleveland Change—B. E. Atwood, who for a number of years was connected with the Cleveland branch of the Ford Motor Co., is now identified with the Coate Motor Co., Cleveland distributor of Paige and Pullman cars, as secretary and manager. L. E. Green, R. E. Craig and L. E. Von Heyningen, formerly with the Ford company, have also joined the Coate company, in full charge of the sales in Cuyahoga County.

Bawden Overland Factory Rep.—F. P. Bawden, formerly receiver of the Child, Day & Churchill Automobile Supply Co., Spokane, Wash., has been appointed factory representative for the Inland Empire for the Willys-Overland Co. Mr. Bawden will make his headquarters with the Harry L. Olive Co., Overland representative in Spokane, and will be under the supervision of J. V. Hough, who has been promoted to take charge of the northwest states, with headquarters in Seattle.

—

Dealer

Newark Pierce to Add—The Ellis Motor Car Co., Newark, N. J., Pierce-Arrow distributor, will build a 90 by 106-ft. garage on New Street.

Prest-O-Lite Opens Battery Station—The Prest-O-Lite Co. has opened a service station for the charging, care and repair of storage batteries at its Cleveland branch at 2032 Euclid Avenue.

Seattle Midgley Adds Territory—The Midgley Tire and Distributing Co., Seattle, of which E. K. Allen is manager, have been appointed distributor of this tire throughout the State of Washington. Quarters have been opened at 1609 Eighth Avenue.

Motor Equipment Co. Moves—The Motor Car Equipment Co., New York City, which for the past five years has been located at 55 Warren Street, has leased the entire building at 19-21 West Sixty-second Street. This structure comprises 55,000 sq. ft.

Takes Falcon Tire Agency—The Buckeye Tire & Supply Co., 75 South Fourth Street, Columbus, Ohio, has taken the central Ohio agency for the Falcon line of tires.

Takes Top Agency—The Cott-McKelvey Auto Co., 446 North High Street, Columbus, Ohio, has taken the central Ohio agency for the Cozy Cab tops, designed for Ford cars.

Springfield Supply House Adds—The United Tires and Sales Co. has established a branch salesroom at 302 East Washington Street, Springfield, Ill., with N. F. Neidringhaus as manager. Tire repairing and car painting will be specialties, while a full line of accessories and tools will be carried. The company is agent for the Vortex Manufacturing Co., Cleveland, and the Schelp-Budke Tire and Rubber Co., St. Louis. The agency will also distribute the Pitner lighting system.

New Willard Stations—The Willard Storage Battery Co., Cleveland, has added a number of service stations in various parts of the country.

The new stations are: Athol Storage Battery Station, Athol, Mass.; F. H. Smith, Pekin, Ill.; James Workman & Sons, Steubenville, Ohio; East Hill Auto Repair Co., Sharon, Pa.; John Electric Co., New Castle, Pa.; Duncan & Fraser, Ltd., Adelaide, Australia; Chellin's Garage, Litchfield, Minn.; New Rochelle Storage Battery Co., New Rochelle, N. Y.; Charles C. Smith, Port Richmond, S. I.; A. A. Seeley, Jr., Troy, N. Y.; Shary Garage, Fairbury, Neb.; Lew & Clark, Baker, Ore.; H. M. Cates & Son, Houlton, Me.; Consolidated Auto Supply Co., Inc., New York City; Plainfield Storage Battery Co., Plainfield, N. J., and Mission Garage, Portersville, Cal.

St. Louis Ford Building Started—The foundation for the $300,000 addition to the local Ford assembling plant at Sarah Street and Forest Park Boulevard, St. Louis, Mo., have been dug and the concrete work is now well under way. The builders hope to finish the concrete work before the bad weather sets in. The addition, which will be a duplicate of the present Ford building there, will be ready for occupancy early next year.

Recent Newark Changes—The Paige-Detroit Co., 588 Broad Street, Newark, N. J., has been formed. J. H. Knox is manager.

The Moon Motor Car Co. of New York, has formed the Motor Sales Agency in Newark at 607 Bloomfield Avenue and at Main and Clinton Streets, East Orange. The Moon agency will embrace Newark, the Oranges and Montclair. H. F. Herdman is president of the new company.

The Mallon Motor Car Co., distributor for the Franklin in Newark, which was formerly located at 35 Halsey Street, has moved into its new quarters at 296-298 Washington Street.

The Bonnell Motor Car Co. has taken the Newark agency for the Haynes.

New Milwaukee Dealer—The Fowler Motor Sales Co. has been organized at Milwaukee by J. C. Fowler, formerly of La Crosse, Wis., who has purchased the business of the Creek Motor Sales Co., 441-445 Jackson Street, agent for the Inter-State and Apperson in Wisconsin and Upper Michigan. Mr. Fowler has effected a close organization, which includes: F. C. Yahr, in charge of retail sales; R. G. Bates, Milwaukee, city sales; A. B. Kent and W. J. Dieman, wholesale representatives.

Give Ford Oiler Territory—The selling territory in eastern Missouri and southern Illinois for the Strong Sight-Feed Oiler for Fords has been divided up among the following four St. Louis firms: Missouri Auto Specialty Co., Illmo Mdse. Co., Campbell Iron Co. and Beck and Corbitt Iron Co. The Strong oiler is manufactured by the Perkins Mfg. Co., Des Moines, Iowa.

Nowick Double Tread Agent—Philip Dolkart has bought out the Nowick Double Tread Tire Co. at 1320 Broadway, Denver.

Louisville Agent Moves—The Kentucky Automobile Co., agent for the Cadillac and Oakland, moved Nov. 15 to the new quarters at 728-730 Fourth Street, Louisville, Ky. This is the building erected several years ago by the Olds Motor Works as a sales and distributing station for the South. It is a three-story fireproof structure.

N. Y. Goodyear Leases—The Goodyear Tire & Rubber Co., New York City, has leased a store at 10 Central Park West, with a large basement space and offices on the second floor.

New Redfield Carbureter Station—The Delmar Automobile Co., 103-5 Orange Street, Wilmington, Del., has completed arrangements to become the service station in Wilmington for the Redfield carbureter.

Minneapolis Items—The Wilcox-Bennett Carburetor Co. is expending $4,000 for a new building at 1024-1026 Ramsey Street. It will be a two-story brick. The Electric Detector Co., 2905 Nicollet Avenue, has changed management, Fred J. Fowler now in charge. The Hudson-Thurber Co., 308 Third Avenue N., hardware, recently adding automobile accessories, has been awarded the exclusive agency in the immediate vicinity for Timken roller bearings.

Trade News from St. Paul—The Brahy-Frei Auto Co., W. H. Frei, manager, has been organized and opened garage, salesroom, storage and machine shop at 825 Selby Avenue. It has taken the Auburn local agency. The Roller Motor Co. is constructing a brick and stone garage, one-story, at Smith Avenue and West Sixth Street to cost $2,000. It is 50 by 70 ft. The Twin City Cord Tire Co., which expects to open a factory in the Gloster shops of the Northern Pacific railroad, has new offices at 1002 Pioneer building.

Excavation has begun for the Twin City Four Wheel Drive Co., $51,000 building at University Avenue and Pelham Street. It will be brick, two stories and will have store fronts and factory facilities. The building is 200 by 142 ft. and is only one block from the new plant of the Overland Stores Co.

South Dakota Changes—Horace Key has sold the Key Auto Co., Huron, S. D., to C. E. Alford, Redfield, S. D., who has changed the name to the Alford Overland Co. Mr. Key has opened a salesroom and will continue to represent the Buick. The F. A. Castle garage has been sold to E. W. Barrett. At Sioux Falls Lind Bros., who came from Centerville, S. D., have leased the former Folkens garage, 324 N. Phillips Avenue. The salesrooms in connection will be used to display Oakland cars.

Cheyenne Hudson to Build—W. E. Dinneen, Cheyenne, Wyo., agent for the Hudson, plans to enlarge his quarters by putting up a new building on an adjoining site. The new building will be used for his machine shop, thus making more room in the present place for salesroom and storage.

Trade Changes in Milwaukee.—The Auburn Motor Sales Co. of Milwaukee, which has just been incorporated with $5,000 capital stock to act as State agent for the Auburn, has leased the former E. F. Sanger garage at 441 Jackson Street, Milwaukee, as headquarters and service station. Mr. Sanger moves to the new Sanger garage at 564-574 Farwell Avenue.

The Noble Z. Smith Co., Green Bay, which has been appointed distributor of National cars for the Fox River Valley district of Wisconsin, has established an office at 730 College Avenue, Appleton, Wis., in addition to maintaining an office in Green Bay, in the Gazette Building.

The Dicke Motor Car Co., Manitowoc, district agent for the Ford, has established a branch house and agency at Two Rivers, Wis., under the name of Two Rivers Auto Supply Co. The company will operate a service station for Ford cars and sell supplies and accessories.

Frisco Goodyear Enlarges Firm.—J. E. Power, who has the agency for the Goodyear truck tires in San Francisco, Cal., and was recently appointed distributor of Goodyear pneumatic tires, has enlarged his firm by forming a co-partnership with T. J. Turner and Frank Marisch. The new firm will be known as the Power, Turner & Marisch.

VOL. XXXIII NEW YORK—THURSDAY, DECEMBER 16, 1915—CHICAGO No. 25

The Automobile

Carbureters Classified

Basic Principles Analyzed—Five Divisions Suggested—Definite Trends Difficult to Decipher

CARBURETER development during the past year leaves it still impossible to see which type, if any particular one, will eventually dominate. Different manufacturers are producing instruments operating along entirely different lines yet aiming to accomplish the same results. The past twelve months have witnessed improvements in the carbureters and makers following different lines. New adherents have joined the different divisions so that it is as difficult as it was a year ago to decipher, even vaguely, the trend of development. One thing is certain, namely, that carbureter makers are endeavoring to keep pace with production, and if production in automobiles has resulted in simplified design and lower cost of production, the carbureter makers are awake to this realization and are keeping step in step with the demands of production.

Carbureter development in the last year has not brought out any new principles in the art, but effort has largely been confined to changing designs to meet the requirements of production as well as in some cases elaborating on present designs to meet more rigid requirements of car owners and manufacturers. Some manufacturers have made considerable changes in their designs to meet these new conditions, while others have brought out new models of a distinctly simplified type, yet incorporating the basic principles of the older and more complicated designs.

The demand for greater acceleration has been one of the distinctive requirements of the 1916 carbureter. With high-speed motors and multiplicity in cylinders together with a reduction in weight of reciprocating parts in the engine the problem of greater acceleration has been placed before carbureter makers, and they have wrestled with it very satisfactorily. Some makers have accomplished this asked-for acceleration by adding somewhat to the complexity of the design while others have started out with new basic principles in design with the hope of solving it in that way.

The year has shown a slight trend toward wider use of the hot-air attachment in preference to water heating. This movement is not general enough to be considered a trend and has been stimulated by the side-outlet carbureter, which eliminates the manifold. Heat in connection with a carbureter is needed to prevent condensation, which is avoided by the internal manifold in the side-outlet type. The production of side-outlet types constitutes one of the conspicuous movements of the season. The side-outlet design is now dividing production with the vertical-outlet design on a fifty-fifty basis. Some concerns that were late in getting their side-outlet types out are behind in orders. The more general use of block motor castings will greatly increase the use of this type.

Before taking up individually the work done during the year by the different carbureter makers it will simplify matters to analyze the general field of carburetion and classify the different makes according to the basic principle on which they are designed.

The Maybach Type

The simplest form of carbureter which incorporates the float chamber and the spraying nozzle was that credited to Maybach in Europe brought out in 1893. This carbureter, Fig. 1, embraced but two features, the float chamber with the float to maintain a fuel level, and the spraying nozzle in the air pipe. There were no regulations, no adjustments. There was a defi-

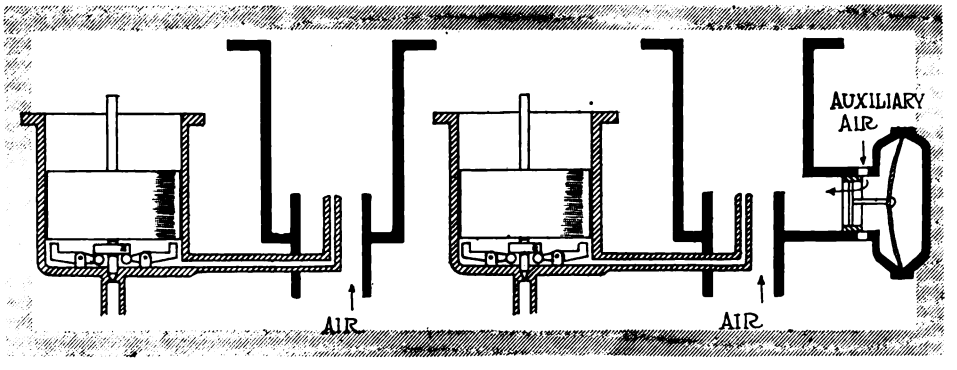

Fig. 1—Diagram of Maybach carbureter with float and nozzle

Fig. 2—Diagram of Krebs carbureter with auxiliary air valve added

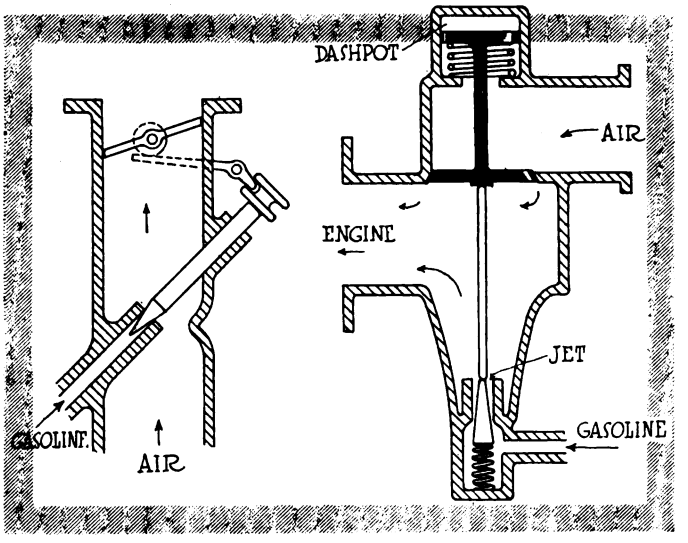

Fig. 3 (left)—Diagram of Schebler model L with metering pin controlled by throttle
Fig. 4 (right)—Diagram of new Schebler model T with metering pin controlled by air valve

nite size of air passage and a fixed size of nozzle out of which the fuel issued. The nozzle and the air passage were proportioned according to the richness of mixture, but once the size of each was set there was no changing.

This type of carbureter proved satisfactory in a relatively limited range of motor speeds such as existed at that time, but when the motor speeds increased, covering a range between 300 and 1200 r.p.m. this type proved inadequate. If it gave a satisfactory mixture for relatively low speeds the mixture was too rich in gasoline vapor on the higher speeds due to the increased air velocity past the nozzle or jet creating too great suction on the gasoline and increasing the rate of flow of gasoline in proportion to the volume of air.

Air Valve Added

It was this weakness in the Maybach type that led to the second important step in carburetion, namely, the introduction of what has come to be known as the auxiliary air valve, the credit of which has been ascribed to Krebs, an engineer of the Panhard company, Paris, France. Krebs realizing the failure in the Maybach design conceived the idea of adding more air when the engine speed increased and he accomplished this by an air valve, Fig. 2, in the form of a leather diaphragm, which while not affected by the relatively low motor speeds, was affected by the higher speeds and when sucked by the increased air current gradually opened an auxiliary valve adding to the air supply and thereby maintaining the desired proportion of gasoline vapor and air.

Air Valve Types

THE Krebs type can to-day be considered the simplest form of carbureter which operates satisfactorily and there are several different models now manufactured based on the principle of the auxiliary air valve only. In these the problem is worked out in different ways. One manufacturer uses a spring-controlled valve; another hopes to get better results by regulating the movement of the valve by two springs, instead of one; still another maker adds an air dashpot with the hope of getting finer regulation and a better functioning of the auxiliary air valve; another uses a dashpot filled with gasoline; and there are others who use metal balls to serve as the auxiliary valve; while others use what are known as weighted air valves. While they all differ in the details of working out the design they are, nevertheless, based on the basic principle of the auxiliary air valve as originally worked out by Krebs. For simplicity in nomenclature we will refer to this type as the air valve type. Some of the concerns manufacturing this type of carbureter are G. & A., Air-Friction, and Breeze. G. & A. uses different sizes of metal balls; Air-Friction uses a weighted air valve; and Breeze a spring-controlled valve.

Metering Pin Class

THE next type of carbureter may, for convenience, be referred to as the metering pin class, metering pin being synonymous with measuring pin. This division incorporates all that is in the air valve or Krebs classification but goes further and inserts a metering pin, which is a pin with a bevel point, not unlike the sharpened end of a lead pencil, in the nozzle or jet from which the gasoline issues. This pin is inserted with the object of regulating the flow of gasoline, and is used in addition to the auxiliary air valve so that this type incorporates four basic features: the float control, the auxiliary air valve, the nozzle in the air passage and lastly, the measuring pin in the nozzle.

Schebler Metering Pin

This metering pin is not stationary but is designed to be moved endwise, either raised or lowered so as to regulate the size of the opening through which the gasoline issues. A conventional form of it is that shown in Fig. 3 used on one Schebler model. The metering pin is linked with the throttle so that as the throttle is opened the metering pin is raised out of the nozzle so as to increase the flow of gasoline in a desired ratio with the increased air, the ratio of increase being obtained by various adjustments between the throttle and the metering pin.

There are other concerns which move the metering pin other than by the throttle, in fact, in the latest model T Schebler, Fig. 4, the metering pin is controlled by the auxiliary air valve. When the valve moves downward, opening, it carries with it the metering pin which extends downward into the jet and is designed to increase the jet volume as it is lowered, whereas in the older Schebler type the jet volume is increased by raising the metering pin. In both the auxiliary air valve is used. In one it is controlled by a spring and in model T by a dashpot and spring.

There are other carbureters in which the metering pin is regulated by what is known as a metering air valve, in short, a measuring air valve to control the measuring gasoline pin. An example is the Stewart, Fig. 5, in which the metering valve shown in black, is rather a complex affair. The metering pin stands vertically in the center of the valve and can be located by the collars on the lower end meshing with

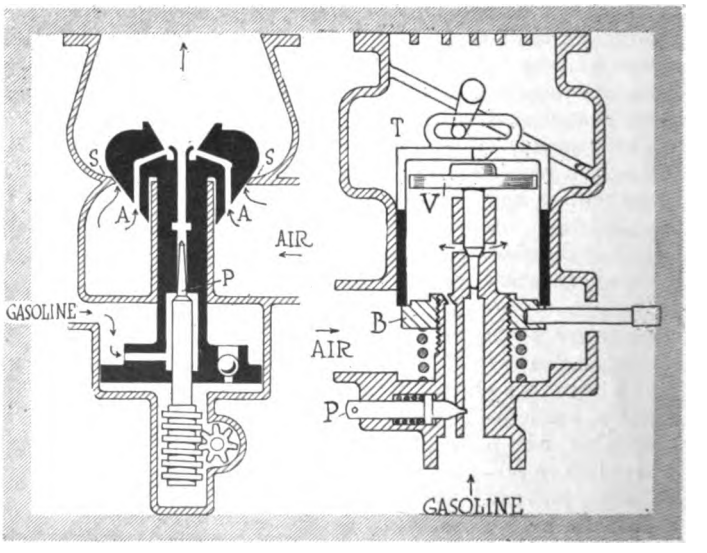

Fig. 5 (left)—Diagram of Stewart with metering pin P controlled by air valve shown in black
Fig. 6 (right)—Diagram of Heath with metering pin controlled by mushroom valve V

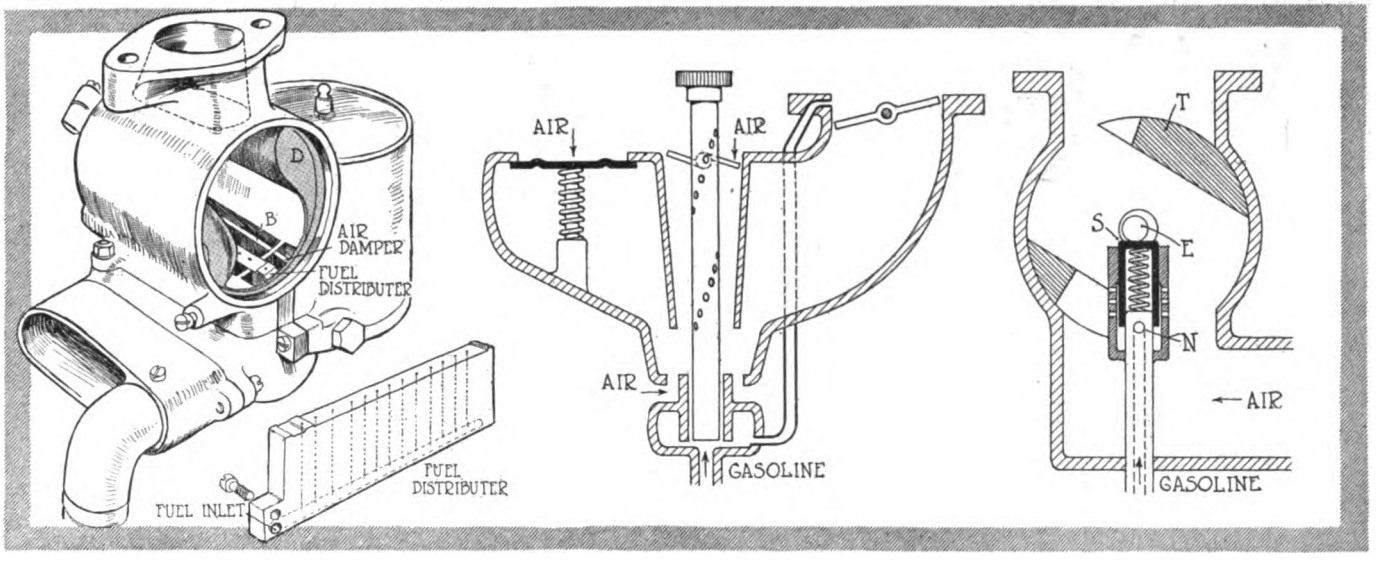

Fig 8 (left)—Master expanding carbureter showing the distributer with dotted lines indicating nozzles. Fig. 9 (center)—Diagram of Carter with standpipe nozzle having spirally-located perforations. Fig. 10 (right)—Diagram of Parkin showing nozzle N covered and uncovered by sleeve S

the small adjusting wheel by which the pin can be raised or lowered as desired. Normally the metering air valve by its inverted cone-shaped top fills the entire air space, the only open space for air to pass being through the two small openings *A* with the arrows indicating the direction of air flow. These passages have air capacity for only very low speeds and as soon as the motor requirements exceed their volume the suction of the engine begins lifting the entire air valve indicated in black. The higher this valve is lifted the wider is the space between it and the metering pin at the point *P* and the greater the volume of gasoline permitted to pass the jet. Also the greater the volume of air passing between it and its seat *S*. By the adjustment provided at the base of the metering pin, the pin is set to supply a definite amount of fuel when the air valve rests on its seat. This quantity can be regulated as desired. In order to get the best possible action of the air valve the lower end of it is in the form of a piston constituting a dashpot operating in a gasoline well. There is a ball valve by which the gasoline is permitted to rise from below to above the piston as the valve settles on its seat. This dashpot gives a more uniform movement and prevents the valve from fluttering.

Heath Metering Pin

The metering pin assumes still another form in the Heath carbureter, Fig. 6, in which it is supported on a mushroom-shaped valve *V* and within the throttle *T*. The throttle is a vertical cylinder open at both ends but the lower end is closed by resting on an adjustable base *B*. The top is open, only the blackened portions of the sides representing the cylinder wall. Raising the throttle *T*, which is equivalent to opening it, raises the lower end off the base piece, so admitting air. This air current impinging on the lower face of the valve *V* raises it, thereby lifting the metering pin out of the nozzle. The greater the air current the higher is the valve *V* raised and the more gasoline issues. This maker goes still further in his regulation by the adjustable throttle base *B* which can be raised or lowered by hand. In order to get a still more delicate relationship between the amount of air and gasoline the upper face of the base *B* is stepped so as to give a finer air regulation. A novel priming device takes the form of a plunger *P* which regulates a separate fuel passage that vertically parallels the fuel passage in the nozzle, and is shown at the left of it. Efforts tending for a more complete mixing of the air and gasoline vapor take the form of a spiral fin in the mixing chamber above the throttle and also a coarse screen across the top of the mixing chamber.

Still another form of carbureter using the metering pin regulation is the Newcomb, Fig. 7, in which the metering pin *P* is carried in a hollow plunger indicated in black, this plunger operating vertically in a cylinder *C* and being lifted in this cylinder by the motor suction. The stronger the demands of the motor the higher is the metering pin raised from the nozzle and the greater the amount of gasoline permitted to flow. The illustration shows the metering pin almost entirely out of the nozzle, and represents the condition with the motor operating at high speed. With the motor at rest the plunger shown in black would be lowered considerably, so that the metering pin would almost close the nozzle. With the first demands of the motor air is drawn from inside the plunger through holes *H* at the base and it is through these holes that the gasoline vapor must also escape and mingle with the air currents in the vertical channels at each side of the cylinder *C*. At the base of the plunger carrying the metering pin is an adjusting collar by which the height of this plunger when at rest can be altered so that a definite setting can be given the metering pin in the nozzle.

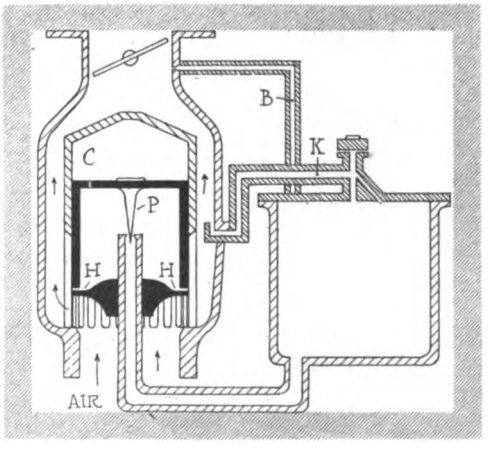

Fig. 7—Newcomb carbureter diagram with metering pin controlled by hollow air valve

Still a further type of metering pin carbureter is that used on the Sunderman, in which an auxiliary air valve, bearing practically the same position with regard to the metering pin as that in the Stewart, lifts the metering pin as the valve is lifted from its seat by the air current.

These five designs include practically all the makes which combine the metering pin and the auxiliary air valve in regulating the flow of gasoline. There are several makes not included herein which make use of the metering pin in controlling the flow of gasoline but introduce many other combinations, making it impossible to include them in this class. The Rayfield uses a metering pin in

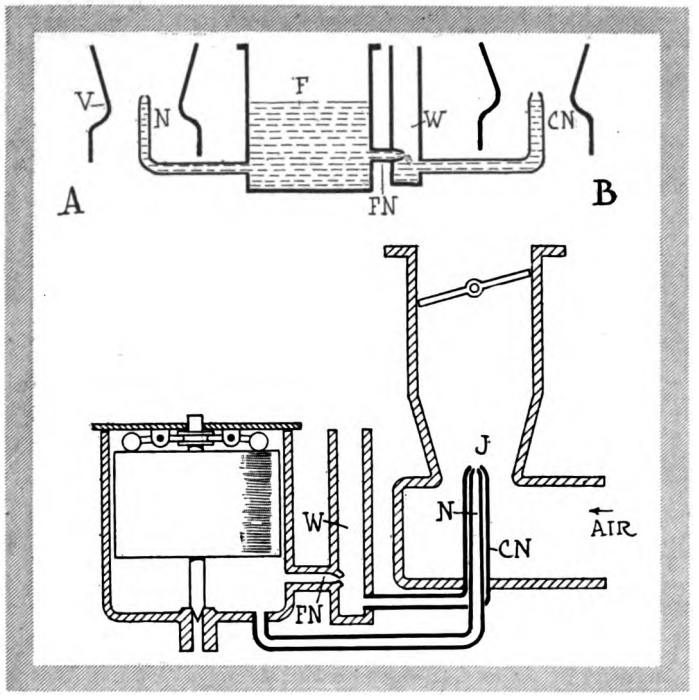

Fig. 11—Zenith compensating jet type made up of two carbureters, one at A, the other at B, which are united in the lower illustration

the main nozzle, but it also employs a secondary jet which places the instrument in a different classification.

Expanding Carbureter Types

THE third division of carbureters are those known as the expanding types and include such makes as Master, Carter, Parkin and Greuter. As the word expanding implies, this division might be designated as the multiple jet type in which the gasoline is fed through several openings rather than one, these openings being progressively uncovered or brought into use according to the opening of the throttle and the demands of the motor. In the Master there are a great many small openings progressively uncovered by the opening of the throttle. In the Carter the gasoline issues through a vertical standpipe in the mixing chamber, this standpipe having a series of small holes drilled in an ascending spiral so that the greater the motor suction the higher the gasoline rises in the standpipe and the more of these small holes it issues through. In the Parkin the fuel nozzle has a cap or covering over it which covering is raised or lowered as the throttle is opened and closed, thus increasing the flow of gasoline in proportion to the demands of air. In the Greuter, which is the only example of a multiple carbureter, there are really three separate nozzles in three separate mixing compartments, these individual carbureters being brought into operation progressively, according to the requirements of the motor.

While all of these expanding types of carbureters vary and are quite different in their external appearance they are really alike in their functioning, for which reason they are grouped under the one head of expanding types. Expanding means enlarging, which is done by bringing into use the additional nozzles or openings through which the fuel issues.

Fig. 8 shows how this is done in the Master. In the lower right is shown the fuel distributor with its thirteen vertical dotted lines indicating as many openings for the flow of gasoline from the main fuel passage in the base of this distributor. The top of this distributor is shown in position in the carbureter, as also is shown the barrel throttle *B* with its curved opening designed to start uncovering these thirteen nozzles in the distributor progressively from one end to the other until all are uncovered, thus establishing its right to be classified as an expanding type. This carbureter also has an air valve or damper, by which the volume of air entering over the top of the various nozzles can be regulated.

Carter Expanding Design

Fig. 9 shows why the Carter carbureter must be classed as an expanding type. In this carbureter is a standpipe constituting the spraying nozzle, and it is in this pipe that are drilled the various holes in the form of an ascending spiral, each hole in reality being a nozzle. At low speeds, when the gasoline is drawn only a moderate height in this standpipe, the fuel issues from but few of the lower holes. As the gasoline rises higher in the standpipe at intermediate speeds it issues from more of the openings; and when it rises still higher at high speeds yet more of the openings are brought into operation. The main air opening is in a vertical tube surrounding this standpipe so that the inrushing air passes along the pipe, excepting at the lower end. There is an auxiliary air valve.

Fuel regulation in the Parkin expanding carbureter is obtained mechanically as the throttle is opened. The throttle *T*, Fig. 10, is a horizontal revolving barrel type with its axis carrying an eccentric pin *E*. This pin bears on the top of a cylindrical sleeve *S* which covers the nozzle. By raising or lowering this sleeve the single large nozzle *N* is uncovered or covered in proportion as the throttle is closed or opened. This is accomplished mechanically by the eccentric *E*, which operates as the throttle is rotated. This eccentric can be adjusted as desired with relation to the throttle. The cylindrical throttle performs a double function: the upper part is the throttle proper and the lower part a variable air shutter. This lower portion controls the amount of air which passes the jet by varying the area of the passageway around the jet.

Compensating Jet Class

THE fourth classification of carbureters has for convenience been called the compensating jet type, and in this class are such makes as Zenith, Holley, Longuemare, and one of the Stromberg models. This carbureter type has been designated the non-moving-part division by some, a title more or less of a misnomer in that there are other carbureters without moving parts, yet which are entirely different in functioning from those mentioned in this division. For example, such as Master and Carter, are without moving parts, yet are expanding types, whereas Zenith, Holley, etc., are not expanding types, and yet are without moving parts.

The Zenith System

The basic principle of the compensating jet type is illustrated in Fig. 11 of the Zenith. This illustration is made up of three parts, parts *A* and *B* above showing the two elements which are incorporated in the complete carbureter shown below. This compensating jet type may be described as a two-fold type: Part *A* shows a float chamber to the right with a nozzle *N* leading into the venturi-shaped mixing passage *V* at the left. This part practically corresponds with the original Maybach carbureter design. It is simply a fixed nozzle located in a fixed air passage. The part *B* at the right illustrates the compensating feature. Here is what is termed a compensating nozzle *CN* in an air passage. This nozzle does not communicate direct with the float chamber *F*, but leads into a well *W*, which receives its supply of gasoline through a fixed nozzle *FN* in the float-chamber side. This well *W* is open to the atmosphere at the top. Its *modus operandi* is: When the motor is idle the gasoline is at the same level in the well *W* as in the float chamber *F* and also in the nozzle *CN*. With the acceleration of the motor the supply in the well *W* is soon consumed, after which air is drawn through the nozzle *CN* along with the gasoline, and it is this

of air and gasoline being fed through nozzle which gives it the name of the ensating nozzle, the air being the m which mixes with the gasoline and es the richness of the mixture.

us combining parts *A* and *B* we have -fold carbureter, shown in the lower on of the illustration, where the two es *N* and *CN* are arranged concen- lly, one outside the other. The nozzle nside, draws its supply of gasoline t from the float chamber, whereas the ide or compensating nozzle *CN* draws supply from the atmospheric well *W*, h in turn is fed by the fixed nozzle *FN* the float chamber. It is because the *W* is open at the top to atmospheric sure that this type of carbureter has n called by some the atmospheric type. term compensating is preferable in t the compensating nozzle *CN* really es care of the desired richness of the xture. The main nozzle *N* would give a xture too rich on the higher speeds, as s shown in the original Maybach, but combining the com- nsating nozzle *CN* with it there is obtained a reduced suc- n on the top of the jet at the point *J* by the fact that a rtain amount of air is mixed with gasoline in coming rough the compensating or outside nozzle, thereby reducing e gasoline flow at higher speeds and effecting the desired mpensation between gasoline vapor and air in proportion- g the mixture.

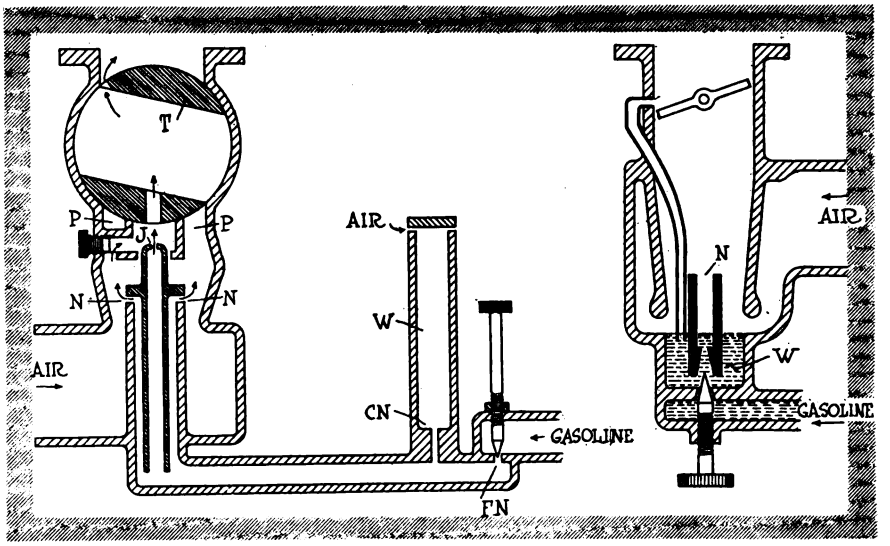

Fig. 12 (right)—Diagram Holley compensating jet type with main nozzle N in gasoline well. Fig. 13 (left)—Diagram Longuemare compensating jet type, main jet N, starting jet J and gasoline well W

he Compensating Holley

A second example of the compensating jet carbureter is ne Holley, the principle of which is diagrammed in Fig. 12. he fuel flows into a little cup or well *W* past a needle valve, which is for hand regulation and does not enter into the asic principle of the design. Into this well *W* dips two ozzles, one *N* which dips deep into the well and ends in he lower part of the mixing chamber. This is the fixed nozzle. The other nozzle takes the form of a tube, which does not dip deeply into the well *W* and extends upward into the manifold above the throttle. This is the compensating nozzle. Study the working of this carbureter. When starting and the throttle is practically closed a rich mixture is sucked up the tube, giving easy starting. Opening the throttle brings the main nozzle *N* into action and soon the fuel may drop in the well *W* below the bottom of the pipe, so that instead of all gasoline being sucked up this pipe there is air mixed with the gasoline, thus giving the compensating effect.

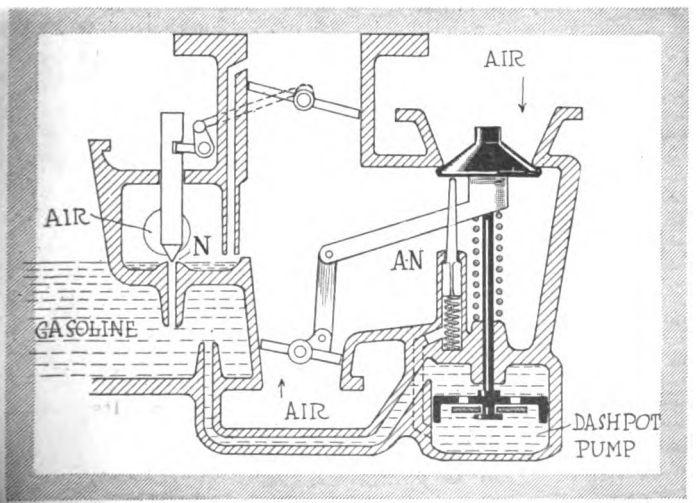

Fig. 14—Diagram Rayfield with main jet N, auxiliary jet A N controlled by air valve and dashpot pump for rapid acceleration

Longuemare Compensation

Another type of compensating jet carbureter is the Longuemare which is diagrammed in Fig. 13, the diagram not conforming accurately to the location of the parts in the carbureter, certain license being taken to make the explanation more simple. This carbureter has a starting nozzle *J* with the top of which registers a small slot in the lower part of the revolving throttle *T*, there being a small escaping slot in the upper part of the throttle. When the throttle is in this position the main nozzle *N* is not functioning. As the throttle is opened the large opening in it uncovers the air passages *P*, thereby bringing into action the nozzle *N* and leaving in operation the small starting nozzle *J*. At the start the gasoline well *W*, open to the atmosphere at the top, is filled with gasoline to the level of the nozzle *N*, but soon this surplus is exhausted and all of the supply must come through the fixed opening *FN* leading to the float chamber. When the gasoline is exhausted in the well *W* then air is drawn in through the top of the well, these air bubbles mixing with the gasoline issuing through *FN* and flowing with it to and through the main nozzle *N*. Thus do these air bubbles reduce the richness of the mixture at high speeds and bring about the desired compensating result. In this carbureter an exceptionally neat design is accomplished by having the adjusting needle for the opening *FN* in the middle of the float and having the gasoline well *W* surround it so that the two thus located concentrically form the vertical guide for the annular float.

A Mixed Division

LASTLY in this classification we come to three of the leading American carbureter types which it is difficult to classify and which do not strictly come under any of the four divisions already delineated. These makes are Stromberg, Rayfield and Kingston. Rayfield uses a metering pin, which pin is lifted as the throttle opens in the main jet *N*, Fig. 14, through a linkage diagrammed, and so establishes a right to be classified as a metering pin type, but it goes further: It incorporates an auxiliary nozzle *AN* which also has a metering pin which is depressed when the auxiliary air valve opens. Thus by having two distinct nozzles it establishes its right also to be classified as an expanding type of instrument. But Rayfield goes still further in that it combines a pumping action on the gasoline in the auxiliary

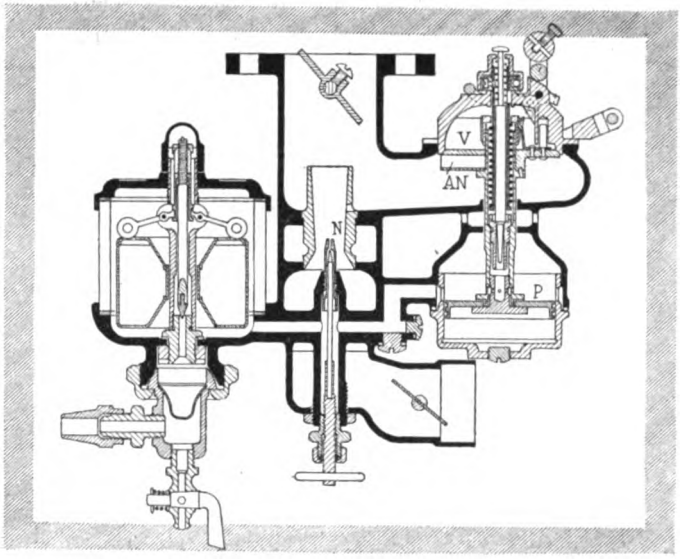

Fig. 15—Section Stromberg model K with main jet N and auxiliary jet A N in the air valve and controlled by it

nozzle *AN* whereby a very rich mixture is furnished for acceleration whenever the air valve is suddenly opened. This is accomplished by the piston on the lower end of the air valve stem, this piston working in a dashpot filled with gasoline. Gasoline enters the dashpot above the piston and is admitted to the space below the piston by the disk valve in the piston. When the air valve suddenly opens, forcing the piston downward, this disk valve is automatically closed, forcing or pumping the gasoline upward through the dotted fuel passage into the nozzle *AN*, where it is sprayed into the inrushing air. Only when the valve opens is this pumping function occurring and at other times the gasoline issues through this auxiliary nozzle according to the suction of the motor. Thus Rayfield is a compound of two metering pins in conjunction with the pumping function for acceleration.

A Stromberg Model

Under our classification Stromberg model K, Fig. 15, is a combination instrument incorporating a main nozzle *N* without any metering pin, having an auxiliary nozzle *AN* incorporated in the auxiliary air valve *V* and which nozzle is regulated by a metering pin shown in the lower portion of the valve stem. The valve *V* is carried on a piston *P* working in a dashpot filled with gasoline. As the valve opens downward the annular space around the pointed end of the metering pin is increased, increasing the flow of gasoline through nozzle *AN*. This measures the additional gasoline needed by the opening of the air valve. The air valve is closed by the spring indicated, the rapid upward closing of the valve being retarded by the slower movement of the gasoline above the dashpot piston passing around the piston to the space below it. Thus does this carbureter combine the features of two nozzles, the auxiliary nozzle including means for supplying gasoline for quick acceleration.

The Kingston Type

Lastly comes the Kingston, Fig. 16. It is a combination of the compensating jet type and also the weighted air valve design. Gasoline flow is regulated by a hand-adjusted needle valve *N* located in the bottom of a gasoline well, the level of which is shown at *W*. Into this well extends the lower end of a small air tube *T* which surrounds the needle valve stem. The normal air passage is obstructed by a hinged metal ball *V* forming a weighted air valve. When starting the motor this air valve remains seated as illustrated, all the air necessary being drawn up the small tube *T*, this tube sucking up a rich supply of gasoline. Soon the supply of gasoline in the well *W* falls below the lower end of the tube *T* and then only air or air mixed with gasoline vapor is drawn up the tube. With increasing motor speed the weighted air valve *V* is lifted off its seat and lifted as needed by the demands of the motor. In operation this carbureter is similar to the Holley excepting that it employs the weighted air valve which the Holley does not make use of. To classify the Kingston it might be regarded as a combination of the compensating jet and weighted air valve type.

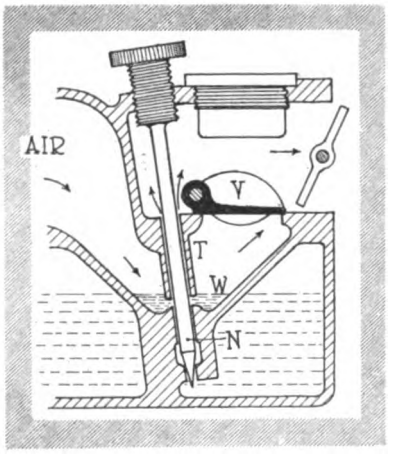

Fig. 16 (left)—Diagram Kingston with starting air tube around adjusting needle and weighted air valve

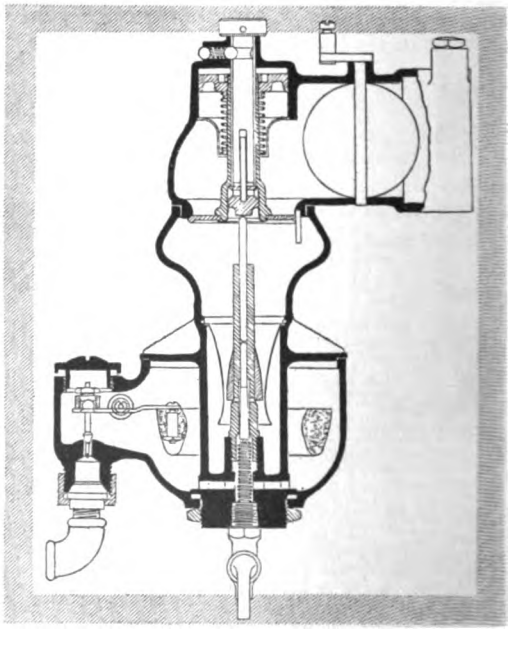

Fig. 17 (right)—Section new Schebler model T with auxiliary air valve controlling the metering pin

Other Carbureter Attachments

THIS concludes the classification of the various carbureters the majority of which are included, although there are some that it has not been possible to incorporate in this review for want of information.

Many of these carbureters incorporate many devices which are not essential so far as the basic principles on which they are based are concerned but which play their part in making more efficient the general work of the instrument. Thus nearly all of them have some feature or other to facilitate starting. The problem of making starting easy in cold weather consists in getting commensurate flow of gasoline. When gasoline is cold it will not issue from a nozzle so rapidly as when it is warmer, thus in starting there must be furnished a larger orifice or opening in the nozzle or else the air supply must be temporarily restricted so that there is a stronger suction on the gasoline.

The customary way to accomplish this is by the shutter valve in the primary air passage. Practically shutting off this passage puts the entire suction on the fuel jet.

Those makers not following this plan have what is termed a by-pass which is a restricted passage leading from the nozzle or near it to a point above the throttle so that when the throttle is closed the engine suction is exerted on this small passage, thus securing the requisite supply of gasoline.

Stromberg uses a shutter valve in the main air intake; Schebler employs a similar valve; Rayfield uses a small by-pass channel to the manifold above the throttle.

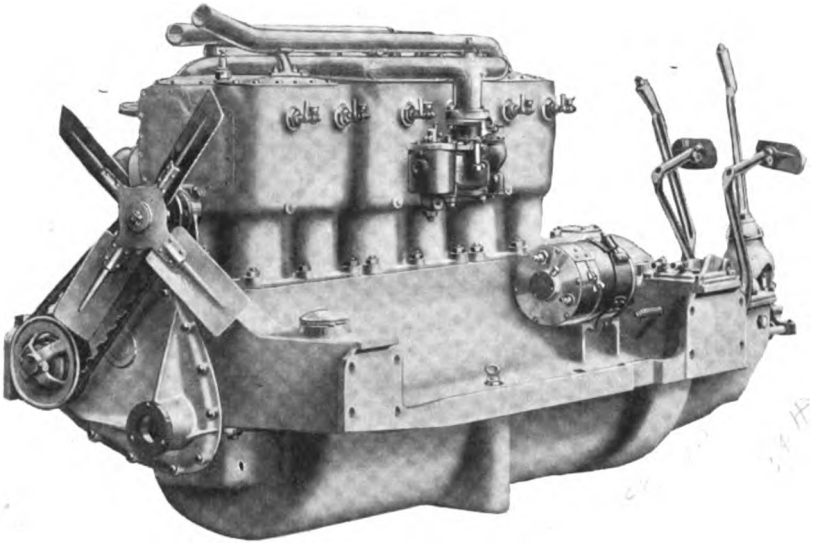
Winton Has Two New Sixes

Chassis on Same Lines Has 33 Hp. or 48 Hp. Motor—Many Small Improvements



New Winton six motor, showing clean design and also mounting of starting motor and carbureter. Note pair-cast cylinders. The two new models are similar, the larger being 4½ by 5½ and the smaller 3¾ by 5¼

FOR 1916 the Winton Co., Cleveland, Ohio, will concentrate its energies upon two new models, both sixes. The larger has 4½ by 5½ in. bore and stroke and the smaller 3¾ by 5¼ in., both being similar in design. With seven-passenger touring bodies the respective prices are $3,500 and $2,285. There are nine bodies listed as standard equipment for each chassis, including practically all types, and the chassis are also obtainable without bodies at $3,000 for the larger and $2,000 for the smaller, while special inclusive prices are quoted for one chassis supplied with two bodies of different type.

Motor Is Neater

The outside of the motor has been cleaned up a great deal, though retaining the lines of former Winton engines. It is noticeable that the pair casting for cylinders is adhered to though the assembly is so compact that the effect is almost the same as that of a block casting. The upper half of the crankcase, which is divided horizontally in the conventional way, has as part of the casting, an aluminum tray which extends from end to end of the motor on either side. Thus the front portion of the chassis frame is completely filled by the crankcase which makes its own sod pan.

On these trays the electrical accessories are disposed very accessibly, the water pump being central on the right side with the magneto behind and Bijur generator in front. On the left side is the Bijur starting motor and the carbureter, which latter has a long intake manifold that is led over the top of the cylinders to a distributing pipe on the valve side of the motor. Both this part of the intake manifold and the exhaust branch are positioned so that they do not interfere with the accessibility of the valves, which are inclosed by the conventional type of cover plate.

In the bottom of the crankcase there is a plunger oil pump, driven by a vertical shaft which carries a skew gear meshing with a corresponding wheel on the rear extremity of the camshaft. This pump draws oil through a screen and delivers it to a main supply tube, cast in the crankcase, whence it passes to each of the four main bearings.

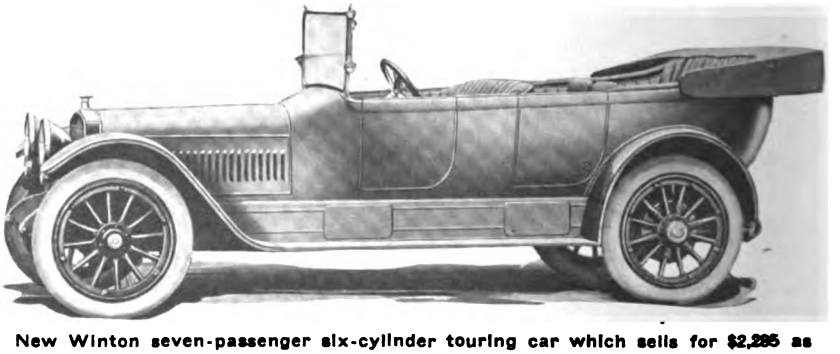
The use of four crankshaft bearings enables each crankpin to have a separate feed through oil holes drilled in the crankshaft, and the smaller moving parts of the motor are cared for by the spray of oil escaping from the main bearings and lower ends of the connecting-rods.

The distribution gearing at the front end is a silent chain passing over the crankshaft pinion, the camshaft sprocket and the generator pinion, and this chain is fed by a pipe that screws into the far end of the main oil supply pipe, thus being streamed with oil continuously.

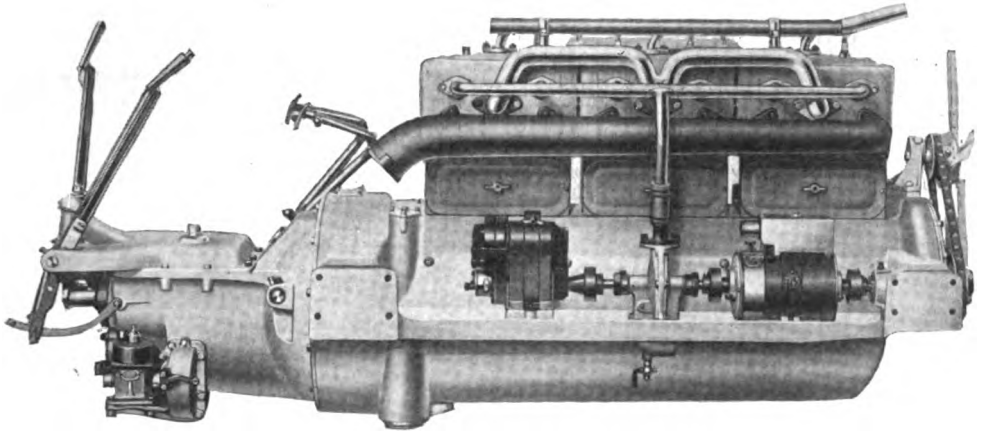
Balance Studied Carefully

The pistons exhibit no especial peculiarity, but are fairly light in section, and they provide the bearing for the wristpin which is fixed to the upper connecting-rod end. The connecting-rods also are the accustomed I-beam forgings, but the makers state that very special care is taken in weighing up the different reciprocating parts, so that the piston and connecting assemblies of each cylinder have the same mass reactions. For the crankshaft, which is 2 in. diameter, a very high tensile steel is employed, and the four bearings are most rigidly supported in the crankcase by spreading webs of metal backing the bearings. A detail which makes for efficiency in the motor is the use of constant acceleration type cams, and quietness is sought by the use of roller ended tappets. The head of the tappet is maintained in contact with the valve stem by a cushion spring, and it is noteworthy that the roller is considerably larger in diameter than usual, being 1¼ in. across by ¼ in. wide.

There are several other interesting details about the motor. For instance, there is a water passage completely around each cylinder, the two included in each casting being separate individually. Owing to the position of the water pump, high up and midway on the side of the motor, its delivery is easily so divided as to give an equal supply to each



New Winton seven-passenger six-cylinder touring car which sells for $2,285 as the smaller model and $3,500 as the larger



Right side of new Winton motor showing mounting of magneto and generator. Note mounting of tire pump on the side of the gearbox

cylinder block and, a conspicuous user's advantage, the glands are ideally accessible for adjustment.

The pistons have rings of a new pattern with step joint ends and there are three to each piston, no scraper ring being used. Priming cocks are supplied in each cylinder, with a cup for holding the necessary small quantity of gasoline and there is also a priming cock in the intake manifold. The placing of the Bosch dual magneto at the rear end of the cylinders allows the wires to be taken into the end of the conduit and so to be distributed with a minimum of exposed length.

The carbureter employed is a Rayfield and the fuel is raised from a tank of 21 gal. capacity at the end of the frame, by a Stewart vacuum feed.

Clutch Has Many Plates

The multiple disk clutch has alternate plates of steel and fabric, and very light pressure suffices to release it, owing to the extremely large surface given by the number of plates employed. It is entirely inclosed between the motor and gearcase, but an amply large hand hole gives free access to the spring.

In the gearset four forward speeds are provided with direct on third, and the top speed ratios are variable. For the large chassis the choice is of four different bevel combinations, the highest being 3.77 to 1 and the lowest 4.73 to 1. On the smaller car the higher of these two is not given, but each of the other three is available.

In the rear axle the driving gears are spiral bevels, and taper roller bearings are used throughout. The propeller shaft is open type and a torque stay is employed.

Springs are three-quarter elliptic at the rear, and take the driving stress, a feature being that both front and rear springs are supplied with the Dann insert which maintains lubrication between the leaves.

Bodies Avoid Extremes

In the bodies the designers have successfully aimed at modernity without adopting ultra-streamline forms. Hoods, cowls and body lines merge, but there is no attempt to make the section of the same shape throughout. On the touring cars there is a slight rise in the level of the side panels, the cowl being the lowest point and the rear seat the highest. A choice of either divided front seats or the old style is given, the price being the same for either. Another option is either wire or wood wheels and practically no limit is put upon the buyer's choice of color schemes.

Of course the equipment is complete to the last detail. The tires are 36 by 4½ in. on the smaller chassis and 37 by 5 in. for the larger.

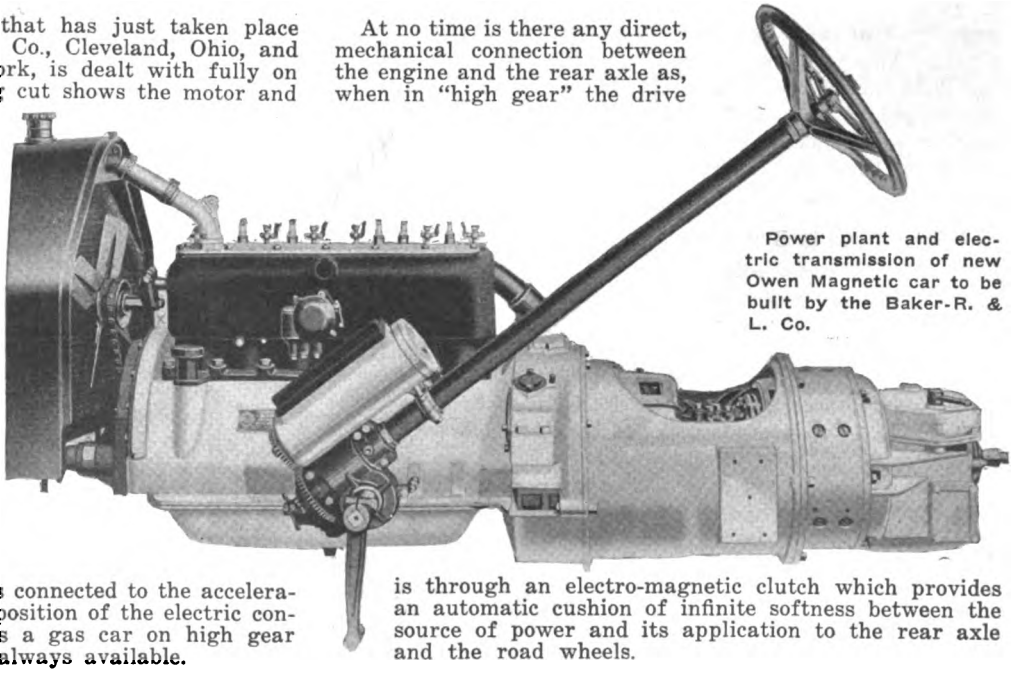
Owen Magnetic in Smaller Size Announced

New Model Is Intended Especially for Town Use

THE combination of interests that has just taken place between the Baker R. & L. Co., Cleveland, Ohio, and the Owen Magnetic Co., New York, is dealt with fully on another page. The accompanying cut shows the motor and electric transmission of the smaller chassis which will at once be added to the large Owen car the manufacture of which will be continued.

The new car is intended to be especially suitable for town use, having a six-cylinder 3½ by 5 in. motor and a steering lock that will allow the car to turn in 38 ft. despite its 126 in. wheelbase. The transmission will be just the same as that which has been used for the present Owen Magnetic, and the whole control is concentrated upon the steering column, as shown in the cut. From starting up the gas engine to braking, everything is controlled by a lever on the steering wheel, except the throttle of the carbureter which is connected to the accelerator pedal. When in the limiting position of the electric control the car operates precisely as a gas car on high gear except that the electric brake is always available.

At no time is there any direct, mechanical connection between the engine and the rear axle as, when in "high gear" the drive is through an electro-magnetic clutch which provides an automatic cushion of infinite softness between the source of power and its application to the rear axle and the road wheels.



Power plant and electric transmission of new Owen Magnetic car to be built by the Baker-R. & L. Co.

New England Tourist Gain 50 Per Cent

$25,000,000 Spent in the Past Summer by Automobile Parties—225,000 Cars and 675,000 People on the Road During July and August

By James T. Sullivan

BOSTON, MASS., Nov. 29—When it is estimated that some $25,000,000 was spent in New England the past summer by motor tourists; that there was a 50 per cent increase in the visitors over a year ago; that during the busy months of July and August some 225,000 cars carrying approximately 675,000 people were moving about day after day leaving a golden trail behind them, it is proof unquestioned that New England was not sidetracked for the San Francisco exposition, and that war did not have any effect on the automobile owners this season.

The writer has made a tabulation of figures each year for the past four seasons on motor car visitors to Massachusetts and New England, and this year the totals show a very substantial increase. In fact, there has been a gain of about 50 per cent in the Bay State visitors this year, which is rather remarkable.

An analysis of the totals for the four years from 1912 to 1915, inclusive, shows that the gain has been nearly 100 per cent, the addition of twenty-eight more cars being needed to reach that score. In four out of the six groups in which the visiting cars are divided the gain from 1912 to this year has been above 100 per cent. This proves the value of expending money on good roads when there are scenic attractions to draw the tourists. It would be hard for any other State—New York with its area and attractions, New Jersey with its Atlantic City and California with its exposition this year excepted—to excel Massachusetts in attracting visitors.

The figures for 1915 show that the motorists east of the Mississippi still kept their machines headed for the Atlantic coast, while those west of the big river were a bit inclined to go to the exposition. In other words, of the different groups, all of them except the far west combination showed a gain. This year there were thirty-four States represented, the same number as a year ago, for while four—Delaware, Mississippi, Arizona and Oklahoma—dropped out, a similar number were added—Arizona, New Mexico, South Carolina and West Virginia. There were cars also from five foreign countries this season.

1310 Registered in Bay State

In the total compilation of machines registered in Massachusetts for the summer months it was found that there were just 1310. It must be remembered that these machines belonged to people who came to stay more than a month. Now for each car that is so registered by an owner who comes here to stay there are scores of machines which are never registered. If one were to make an estimate and say that for each car so registered there are at least fifty machines traveling about that do not have to register it would not be putting the figures too high. And that would give 65,500 such cars added to the 1310 registered ones. Assuming that 66,810 machines came to Massachusetts, each carrying three passengers, we have 200,430 motorists from outside the Bay State who were welcomed here last summer.

To get some idea of what this means one must remember that Boston is particularly fortunate in its situation to attract motorists. It is a central point for tourists that cannot be overlooked. If they come in through the Adirondacks, Canada, the Green or White mountains they gravitate down to the ocean and Boston. From that point there are many places of historic interest to keep them a few days. Then they pass on their way West and South. If they come along the coast or through the Berkshires again Boston is the destination, for through that city the path lies to the famous North Shore where the Atlantic is seen at its best, and then on up to the mountains.

So when one takes the figures for Massachusetts he takes the tone representative of all New England. The other States get a large proportion of the tourists that visit the Bay State, perhaps 85 or 90 per cent, but Massachusetts gets about 99 per cent of all who visit the five other New England States.

Spend $600,000 a Day

Therefore if more than 200,000 motorists from outside Massachusetts entered her domain last summer it meant that they were spending at least $600,000 a day on their touring. And limiting them to some ten days or so in the Bay State there is $6,000,000 scattered about. Now if they spent an equal sum among the other States—that is, figuring that 50 per cent of the tour was in the Bay State and the rest in one or all of the others—it gives a total of $12,000,000 from summer tourists.

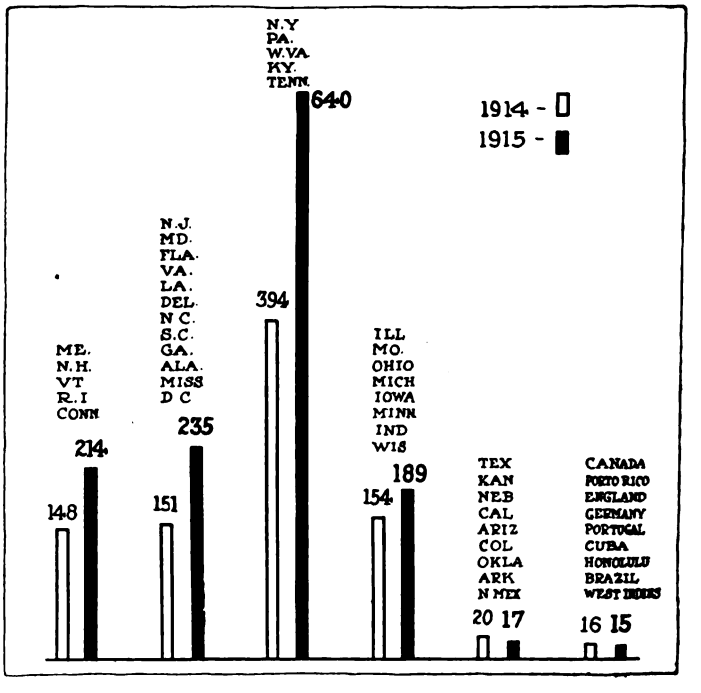


Diagram showing the comparative representation of various States and countries among the automobile tourists in Massachusetts during the past Summer and that of 1914

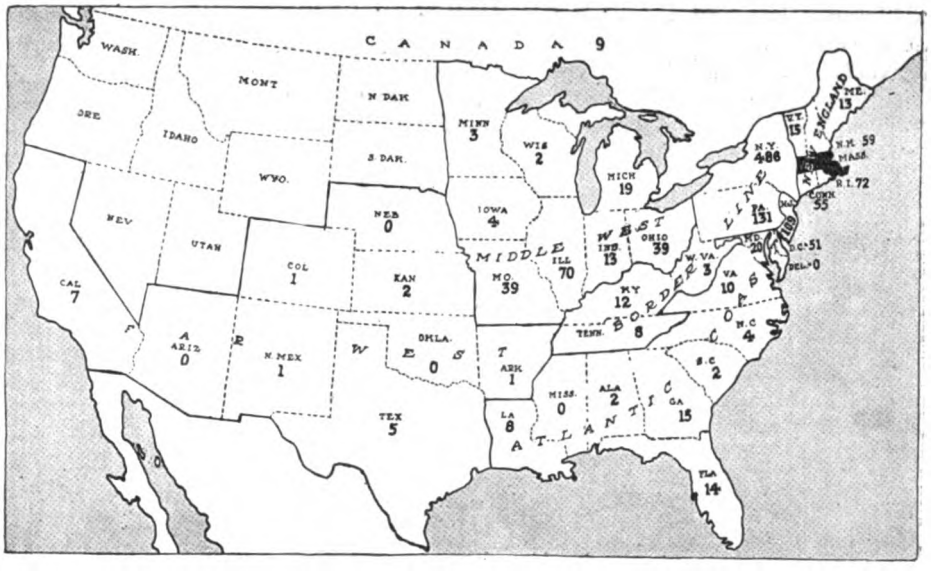
But that is not all. Take the motor cars owned in New England, numbering about 175,000, as an additional total. They were out every day with their owners and families or friends, and placing the average passengers at the low figure of two for a car, there were 350,000 more people on the New England highways. And living at home they did not all have hotel bills to pay, so the cost of each for a day may be put down for $1, the price of a few sodas, cigars, etc., and you have an expenditure of $350,000 a day. Assume that the great majority has but two weeks vacation and it was spent touring, the cost would roll up to that time about $5,250,000. But there are Sunday and holiday tours in summer. From May 1 to Oct. 31 there are five holidays in Massachusetts. There are at least four Sundays to a month so that would mean twenty-four more. Eliminate three Sundays and say two holidays and class them in the vacation period and a couple of Sundays for bad weather and there still remains at least twenty real out-of-doors days in which motorists spend money. It gives you a total of some $7,000,000. Here is a summer's total reaching $24,750,000 in New England alone, an entire section of country smaller than any one of several Western States. Certainly, with the money spent by the wealthy people who come to Massachusetts or other New England resorts for long stays and that spent on odd days an estimate of $25,000,000 for the summer months is not excessive.



Map of the United States showing the number of cars in each state which traveled over the Massachusetts roads in the past summer

Comparison by Groups

In past years the writer has divided the various sections into groups and the figures allow an admirable comparison. The New England group comprises the cars from the five other States that registered with our Highway Commission for lengthy stays. All the States except Maine show a gain this year so that the figures run to 214 when last year they were 148, that is sixty-six more. Here they are:

New England Group

	1912	1913	1914	1915
Maine	3	6	16	13
New Hampshire	12	10	41	59
Vermont	2	4	4	15
Rhode Island	42	42	57	72
Connecticut	43	43	30	55
Totals	102	105	148	214

Next, we have the States along the Atlantic coast from New Jersey to the Gulf. Here again there is a pronounced increase. There are eleven States in the group. Eight show a gain, two a loss and one is similar to the figures of a year ago. There were 151 machines registered last season and this year the total jumped to 235, a gain of eighty-four. This shows that in the number of States increasing their figures meant some 75 per cent, and in machines registered it went above 50 per cent. New Jersey and District of Columbia were the big gainers. Here are the figures:

Atlantic Coast Group

	1912	1913	1914	1915
New Jersey	56	80	64	109
Maryland	17	16	17	20
Florida	3	8	7	14
Virginia	5	5	8	10
Louisiana	4	3	6	8
Delaware	..	2	1	..
North Carolina	..	2	5	4
South Carolina	..	2	..	2
Georgia	1	2	7	15
Alabama	2	..	2	2
Mississippi	..	..	1	..
District of Columbia	12	23	23	51
Totals	100	143	151	235

The next section is divided into what is termed the Border States and while numerically they number less than any other group except New England the totals are far greater. That is because New York and Pennsylvania are included.

England	0	1	1	1
Germany	0	0	1	0
Portugal	0	0	1	0
Cuba	1	1	3	2
Honolulu	1	0	0	0
Brazil	1	0	0	0
West Indies	0	0	0	1
Totals	670	744	882	1,310

Of the five States four showed a gain. New York was the more notable with 486, a jump from 300 of last year. Pennsylvania went from eighty-one to 131, and Kentucky, considering its distance, made a triple advance from four to twelve. The total for 1915 was 640. Last year it was 394, a remarkable jump. The totals follow:

Border Line Group

	1912	1913	1914	1915
New York	209	220	300	486
Pennsylvania	78	80	81	131
West Virginia	..	1	..	3
Kentucky	4	9	4	12
Tennessee	6	5	9	8
Totals	297	315	394	640

The Middle West group comprises the States in the section about the Mississippi Valley. There are eight States included in it and five of them, a majority, did better than a year ago; two lost and one was even.

Middle West Group

	1912	1913	1914	1915
Illinois	39	45	56	70
Missouri	40	41	39	39
Ohio	40	29	21	39
Michigan	15	13	18	19
Iowa	2	5	3	4
Minnesota	2	4	4	3
Indiana	3	7	9	13
Wisconsin	1	2	4	2
Totals	142	146	154	189

The Far West group comprises the States beyond the Mississippi. It was expected that if there were any loss it would be in that region, due to the exposition. And that is where the loss occurred. But it was not so very great. There are nine States in the list. This is the first year that Arkansas and New Mexico are included and they balance up for the loss of Arizona and Oklahoma. Of the nine, Texas and Kansas show a loss, while California, the most distant, shows a gain. There were twenty cars on the list a year ago and this season the figure is seventeen, a drop of three. The figures follow:

Far West Group

	1912	1913	1914	1915
Texas	8	10	9	5
Kansas	1	9	4	2
Nebraska	4	3	..	..
California	7	4	4	7
Arizona	..	..	1	..
Colorado	2	..	1	1
Oklahoma	..	..	1	..
Arkansas	..	..	..	1
New Mexico	..	..	..	1
Totals	22	26	20	17

The final group comprises the cars outside the United States known as the foreign section.

Foreign Group

	1912	1913	1914	1915
Canada	2	3	7	9
Porto Rico	2	4	3	2
England	..	1	1	1

To Make Hydromotors in Los Angeles

LOS ANGELES, CAL., Dec. 9—A factory is to be built in this city for the manufacture of Hydromotors. The company is now applying for articles of incorporation under the laws of California.

The experiments with the Hydromotor at the Panama-Pacific International Exposition were successful enough to prove that a land and water automobile was a practical possibility. During the closing week of the exposition, six voyages were made on San Francisco Bay and once the automobile launch ventured out of the yacht harbor.

A. Maini, president of the company which put out the first model, announces that the factory will be located in southern California. G. Lopizich, president of the International Bank of Los Angeles is to head the new company which will manufacture these land and water automobiles.

More than a year ago, the Board of Trade of Lankershim, Cal., offered the company a manufacturing site. A site has now been offered at Wilmington, the Los Angeles Harbor, and it is probable that the site will be accepted as at Wilmington, the location will provide for the testing of machines on both land and water.

According to the present plans of the corporation's backers, four models are to be offered. A two-passenger roadster, a seven-passenger touring car, a light delivery truck and seven-passenger limousine. The same chassis is to be used for each type of body. The limousine is to sell for $3,000 and the roadster at $2,000 with the touring car and truck coming between these figures.

The machine shown at the exposition weighs 3000 lb. The body is of aluminum. All the joints are made water tight. To insure this condition, 2-in. brass bands are riveted to the edges. The length of the car is 16½ ft. In the water the machines is propelled by a 16 in. screw propeller. The wire wheels measure 42 in. in diameter.

In the water a patented bronze sliding device locks the water out of the axle housing.

The first machine is propelled by a 6-35 Haynes engine hung on a special chassis.

A ventilator at the prow and a small opening on the forward deck, allows enough air circulation to keep the engine cool. Gear levers at the right of the steering post allow the driver to shift the power from the wheels to the screw when the machine begins to float. Both the wheels and the propeller may be operated at the same time.

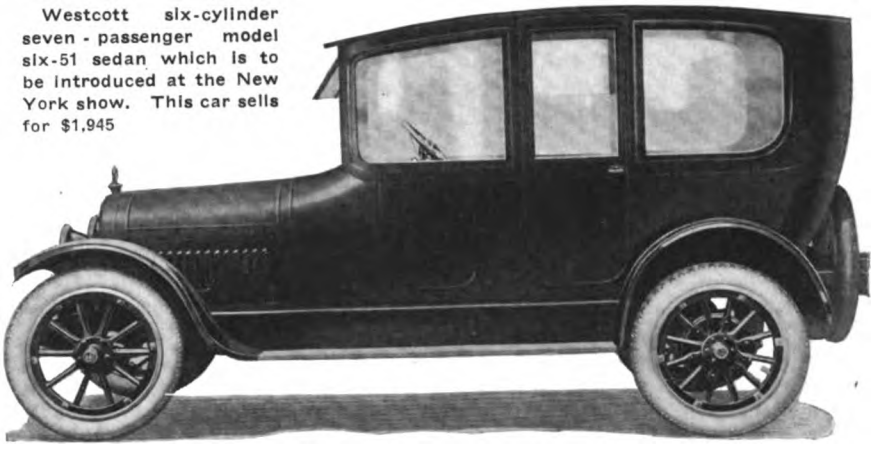
A sleeve engages a pin on the steering post which provides for change of steering control, automatically locking the front wheels and engaging the rudder. A reverse of the operation releases the wheels and disengages the rudder.

The Hydromotor—an amphibious automobile

Westcott Adjusts to Suit Driver

Two New Sixes Announced—Sedan Top for Touring Car—Lightness Studied

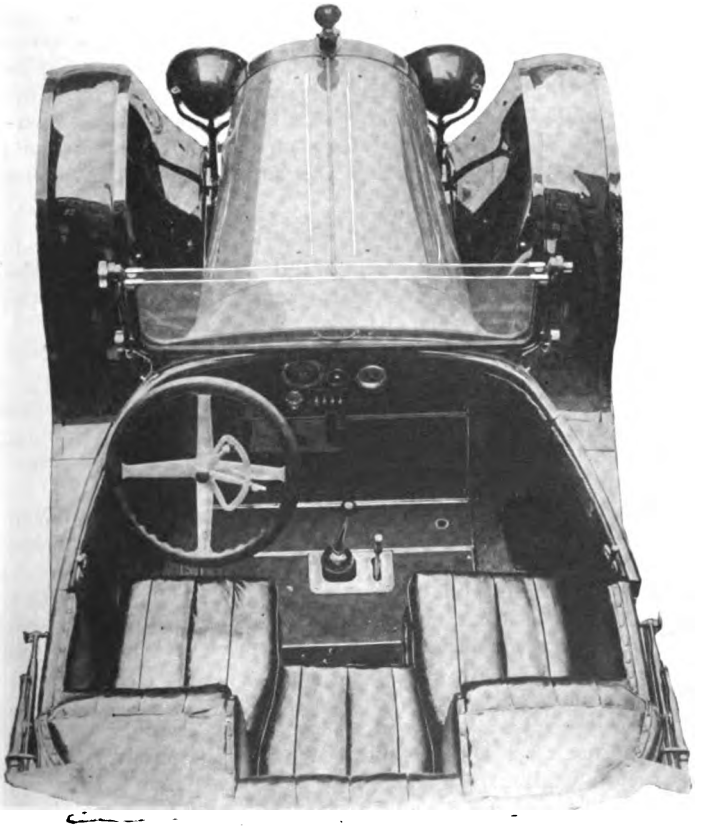
THE two new Westcott cars made by the Westcott Motor Car Co., Richmond, Ind., are both sixes, one a little larger than the other, being intended for seven-passenger bodywork. In design the two are similar, the same motor, a Continental 3½ by 5¾ in., being used for both. The respective wheelbases are 121 in. and 126 in. and the longer chassis has larger tires. Prices are $1,945 for the seven-passenger sedan, with an alternative choice of open touring or three-passenger roadster bodies at $1,595. The short chassis has similar open bodies, at $1,445, but with a maximum of five-passenger capacity, and also a cabriolet, for $1,746.



Westcott six-cylinder seven-passenger model six-51 sedan which is to be introduced at the New York show. This car sells for $1,945

Sedan Has Special Windshield

Particular pains have been taken with the sedan car, which is convertible to an open touring type. When the two portions are joined together, the upper structure has no overhang where it meets the sides of the lower part, and one of the greatest difficulties with demountable top bodies, that of making a good join around the windshield, is overcome by supplying a special shield for the closed car and utilizing it as one of the main, basic attachments. Two bolts suffice to make the attachment, the shield detaching from the brackets that hold it in place.



Driver's compartment of new Westcott model six-42 roadster, showing seating arrangement. This car lists at $1,445

The interior of the demountable top is finished in accordance with proper limousine style with good grade cloth, silk curtains, etc.

Adjustable Driving Position

On the roadster and cabriolet bodies the clover-leaf seating arrangement is adopted, and it can be seen from the plan view that the seats have been so disposed that the middle passenger has plenty of elbow room without the driver being pushed so far to the left that he has to sit sideways to the steering wheel, as has happened in some similar designs. Further, the comfort of the driver is studied by giving no less than a 6-in. adjustment on either pedal, and so mounting the steering column that it can be moved to suit the driver's length of arm. These adjustments give practically the same effect as an adjustable seat, without calling for extra weight in the body which is necessary to enable a sliding seat to be made rigid.

A special point is made of the quality of the leather used for upholstery, which is an enameled finish variety. It is fitted without buttons, which, in conjunction with the smooth surface, makes it very easy to keep perfectly clean.

Lubrication Simplified

Another, and quite different way in which the Westcott engineers have studied the convenience of the driver, is in the disposition of small parts requiring attention, and one result of this is that there are only five greasers under the body.

Lightness has been studied, and the motor has pistons and cylinders as the only cast iron parts, the whole crankcase being aluminum. The rear springs are cantilevers of chrome-vanadium steel and are 52 in. long; very short shackles are used at the front ends of these springs, this being claimed to eliminate roll while not affecting any riding quality. The chassis has a unit power plant and Timken axle equipment, with open type driveshaft and a double torque arm.

Accessory equipment includes a clock, dome lights in the sedan, double tonneau lights and, on the touring cars, a special fitting for stowing the Jiffy curtains wherein they are held by springs and cannot rattle.

Altogether the Westcotts are excellent examples of how an assembled chassis can be made a car of decided character.

The Rostrum

Gasoline Plus Chamois Gives Electricity

EDITOR THE AUTOMOBILE:—Am sending you herewith a clipping from the Timken magazine, House Organ of the Timken Detroit Axle Co. which in part reads as follows:

Let us assume that you are about to fill your tank. The funnel is in the nozzle. A chamois strainer is in the funnel. The gasoline is turned on and as it pours through the chamois it generates static electricity. Static electricity may be defined as electricity that is at rest.

Static electricity, as we have said, is now in the funnel. The funnel is charged with it. So long as the funnel fits securely into the mouth of the tank, thus creating a "ground," you are safe.

Now, let us assume that you did not allow the funnel to rest inside the nozzle of your tank, as the gasoline seeped through the chamois skin. Either yourself or someone else held the funnel in midair, or it rested free of the sides of the tank. No "ground" was formed.

We have seen that gasoline, a volatile substance, passing through chamois forms static electricity, which charges the funnel. When the amount of electricity is sufficient to produce a jump spark, that spark, jumps to the nearest "ground," which is your tank. In doing so it must pass across the opening between the end of the funnel and the edge of the tank through which gasoline vapor is rising.

The moral to be derived from this article is this: DO NOT PUT GASOLINE THROUGH CHAMOIS SKIN. But if you will insist on taking chances, be sure that you have a "ground" on it, by seeing that the funnel touches the opening of the tank. Be doubly sure that you take this precaution.

Would you please give us the best advice on this subject through THE AUTOMOBILE?

Newfoundland, N. J. R. E.

—The article which you cite was from information furnished to the Timken magazine by Henderson Bros., of North Cambridge, Mass. who recently nearly suffered the loss of a relative through the combination of circumstances mentioned. The fact that static electricity is generated by the pouring of gasoline through chamois seems to be clearly demonstrated. To secure the view point of the Henderson Bros., on this subject THE AUTOMOBILE received from them a letter of which the following is a copy:

"This accident happened to my son, and as there was no possibility of anything except static electricity we went into the matter a little more thoroughly than seemed necessary after it had happened. We found the fact to be known to most fire chiefs that gasoline and chamois was a fatal combination, but none of them could explain the reason why. At a consultation with one of the leading electrical engineers in Boston, and by experimenting we found that this static electricity was dangerous only when the funnel, or the pipe was not grounded, and this was caused in three ways. First, as in the Timken magazine, that is the funnel resting on the wood making a perfect insulated funnel; and the second condition was, when filling the funnel and the tank becomes nearly full, it is the custom to hold the funnel outside the tank, the gasoline running through the funnel and when the funnel touches the tank it again forms a spark of static electricity.

"We also had a long talk with young Mr. Firestone when he was here, and he informed us that his brother was burned to death in a garage accident. You might possibly get some added information from the Firestone family in regard to this accident. There have been four fatal burnings in and around Boston since my son's accident which was directly attributed to static electricity forming in the funnel. The more that this particular thing is impressed on the automobile public, the less chance there will be of repeating these accidents. If we have been instrumental in stopping that condition anywhere, we will have been amply repaid."

Renault Cover Plate Threads Worn

Editor THE AUTOMOBILE:—In my Renault's transmission the threads which support the back plate are all worn. New threads have been replaced and after about 100 miles the threads became worn out again so that no hold whatever can keep the plate to the larger part of the transmission. On account of the same trouble the high speed cannot keep in place but slips out causing a sort of noise as if some part of the car had dropped off. Could you instruct me how to repair this and if possible give me diagram?

Barranquilla, Colombia. R. I.

—From the information you give it is surmised that you refer to the back plate in the gear box. To make a satisfactory job the holes where the studs are fitted should be filled up with aluminum alloy and new studs fitted in. This work should be handled very carefully as otherwise, the gearshaft will be pulled out of parallel. If there is a Renault service station in your location the work should be done there.

Wants Data on Farm Tractors

Editor THE AUTOMOBILE:—Will you kindly answer the following questions in regard to motor farm tractors in the Rostrum:

1—What power is needed in a gasoline tractor to pull four 16-in. plows?

2—Can a tractor wheel of 30 to 32 in. in diameter have as much traction or pulling power as a larger wheel, assuming the vehicle is run at the same speed and with the same power applied?

3—Has a tractor got as much pushing power as pulling power or would the maximum load vary according to whether it was pushed or pulled?

4—Could an electric generator powerful enough to start a 40 to 45 hp. motor run an electric motor requiring about 3 hp.? What would be the wholesale price of such an apparatus?

5—Is there any way to transmit power between two points, the distance between which is constantly changing, except by the use of a flexible cable? Would it be possible to construct a cable strong enough to transmit from 3 to 5 hp. over a distance of 4 ft. and if possible, would it be practical?

6—Kindly publish a formula whereby I can calculate the pulling power at the drawbar of a tractor when the weight,

horsepower of the motor and the distance between the motor and the center of the driving wheels are given.

Red Wing, Minn. N. L. W.

—This question cannot be answered definitely without much other data such as the weight of the tractor; the method of drive and the power loss therein; the drawbar pull of the unit; the approximate weight of the plows and platform; the depth of the furrow and the condition of the soil. However, THE AUTOMOBILE can cite you one of several makes of tractors now on the market which will pull four 16-in. plows. The Knapp tractor, made by the Rochester Gas Engine Co., Rochester, N. Y., is a three-wheeled, gear-driven unit weighing about 8750 lb. and equipped with a four-cycle four-cylinder gasoline motor of 4¾ in. stroke and 6¾ in. bore, developing 36.15 S. A. E. hp. This power is sufficient to pull four 16-in. plows and platform and give a depth of furrow of 6 to 10 in., varying with the condition of the soil.

2—With no slip, the pulling power of a wheel varies inversely as the diameter, the power applied and the gear reduction remaining a constant, or the smaller the wheel, the greater the pulling power. But in your case, assuming the same vehicle speed and a change in gear reduction, a 30- or 32-in. wheel would have no greater pulling power than a larger wheel, provided it did not slip. Here other practical considerations come into play, such as the condition of the soil, the coefficient of friction between the wheel and the ground and the pressure per square inch of the wheel on the soil due to the weight of the vehicle and its load. From these considerations, it may be deduced that greater pulling power may be obtained by the use of large wheels with the power applied and the vehicle speed remaining constant, because they give a larger area in contact with the ground and prevent slipping or sinking into the soil. They also mount obstructions much more easily than smaller wheels.

The relation between the pulling power of a vehicle and the diameter of the driving wheels is shown in the formula given below:

$$VC = \frac{8.4\, nb^2sR}{DW} \times em \times et$$

Where VC = Tractive factor or vehicle coefficient.
n = The number of cylinders
b = The bore in inches
s = The stroke in inches
R = The gear reduction
D = The diameter of the driving wheels in inches
W = The total weight of vehicle and load in pounds
em = The efficiency of the motor as compared with the S. A. E. rating as unity
et = The efficiency of the transmission system, *e.g.*, the percentage of the power developed which reaches the driving wheels.

The above formula was derived by C. T. Myers, mechanical engineer, Detroit, Mich., for the purpose of comparing motor vehicle performance. It shows the very important inter-relation of the motor displacement, the gear reduction, the diameter of the driving wheels and the total weight carried. It also shows how very important the reduction of weight becomes and the marked effect of an increase in the gear reduction.

3—On a perfectly level road any motor vehicle has as much pushing power as pulling power, but as there are no such roads in existence, this equality does not hold and the pulling power exceeds the pushing power. The path of a farm tractor over rough and uneven fields is one continual process of lifting the vehicle wheels over small obstructions, and as it takes more power to push a wheel over an obstruction than it does to pull it over, the vehicle can pull more than it can push. The reason why it takes more power to push a wheel over an obstruction than it does to pull it over, may be best understood by analyzing the forces which comes into play.

The force transmitted to the driving axle of the vehicle may be shown graphically by a horizontal line parallel with the ground. As soon as the front wheels strike an obstruction, a portion of this force is resolved along a line from the point of application on the driving axle to the point where the front wheel touches the obstruction. The remainder, resolved at right angles to the latter force, tends to raise the wheel up and over the obstruction. This lifting force acts on an imaginary bellcrank lever, the fulcrum of which is at the point where the wheel strikes the obstruction and whose arms extend from the fulcrum to the center of the wheel hub and to the point of contact of the wheel on the ground.

The lifting component of the total force acts on the arm of the lever between the fulcrum and the center of the wheel hub at distances proportional to the distance from the fulcrum to the point of application of the total force on the driving axle of the vehicle. The nearer the driving axle is to the fulcrum, the greater is the leverage of the lifting component of the force about the fulcrum. The greater the leverage, the easier is it for the wheel to mount the obstruction.

In the case of a tractor pushing a trailer, the driving axle would be further away from the fulcrum than if the trailer were pulled, and for this reason the leverage of the lifting component of the propelling force would be less, thus making it harder to push the trailer over the obstruction than to pull it.

This principle is shown in Fig. 1, which illustrates the analagous case of a front- and rear-wheel-driven vehicle. In the case of the front-wheel-driven vehicle, *ab* represents the force propelling it along a level road. When it strikes an obstruction, such as *D*, the force *ab* may be resolved perpendicular to and parallel with the line *ED*, *D* being the point of contact of the wheel and the point about which the wheel must be lifted so that the vehicle may continue on its way. *D* is the fulcrum about which the resolved lifting component *ac* of the force *ab* is applied.

In the case of a rear-wheel-driven vehicle the same force *ab* is applied along the line *eD*, this line continued passing through the point of application on the driving axle. The force *eg* is equal to *ab*. Its lifting component *eh*, however, acts about the fulcrum *D*, at a distance *ef*, which is less than *ad* in the case of the front-wheel-driven vehicle. Therefore, in the first case, $ad \times ac$ is greater than $eh \times ef$ in the second case, because whereas *eh* and *ac* are equal, *ad* is greater than *ef*. Thus a front-wheel-driven vehicle may pass over obstructions with greater ease than a rear-wheel-driven type.

4—Yes. The wholesale price of a 3-hp. direct-current motor-generator set would be about $150.

5—THE AUTOMOBILE knows many other methods of transmitting power betwen two points, the distance between which is constantly changing, besides that of a flexible shaft, as follows: Electric current; hydraulic circulation; compressed

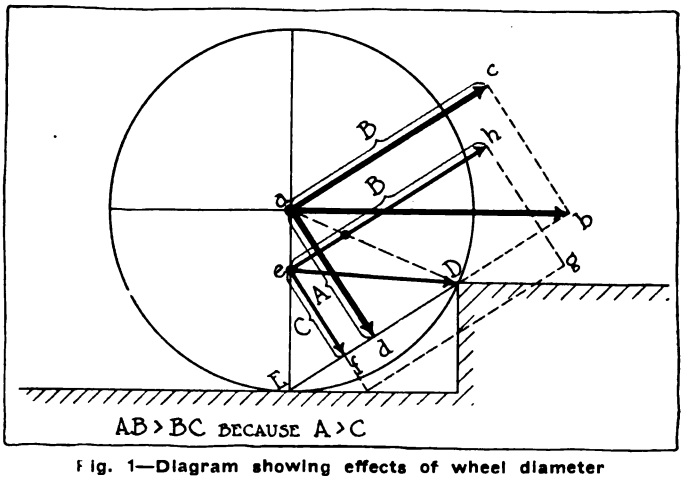


Fig. 1—Diagram showing effects of wheel diameter

air; vacuum; a scissors-shaped frame using any one of a number of forms of transmission, such as trains of spur gears, belts and pulleys, chains and sprockets, bell-cranks and connecting rods, etc. Transmitting 3 hp. through a flexible shaft 4 ft. long is practicable, providing the speed of the shaft is not excessive.

6—Comprehensive tests with motor trucks have shown that the average motor truck when full loaded develops a drawbar pull equal to about one-quarter its gross weight; *i.e.*, weight of vehicle and load. This ratio is changed by road conditions and grades.

According to George Watson, of John I. Thornycroft & Co., Basingstoke, England, drawbar pull may be calculated by the two following formulae as published in Vol. 1 data sheets of the *Society of Automobile Engineers:*

$$T = \frac{n \text{ Horsepower } 375}{V}$$

Where T = Tractive effort in pounds
V = Velocity of vehicle in miles per hour
n = Efficiency of gearing. Take 0.9 for each gear and

$$T = W\left(R + \frac{2240}{m}\right)$$

Where T = Tractive effort in pounds
W = Gross weight of vehicle and load
R = Resistance to traction in pounds per ton of 2240 lb.
For loose sand, $R = 560$; for hard, dry clay, $R = 100$
m = Gradient, 1 in M. For instance, when grade is 1 in 5, $m = 5$.

It will be observed that these formulas contain the weight and the horsepower of the motor. The distance between the motor and the center of the driving wheels has nothing to do with the drawbar pull except that it might affect the efficiency of the power transmission, but this is covered in the first of the two formulas given.

Power Strokes of Eights and Twelves

Editor THE AUTOMOBILE:—In an eight- and twelve-cylinder motor how many power strokes to one revolution of the crankshaft?

2—How many strokes does the piston make to one of crankshaft, of the eight and twelve-cylinder motor?

3—How many revolutions does the crankshaft make to one of the cams?

4—How many degrees are the S. C. P. and E. strokes apart?

5—Recently my car has been giving me quite a little trouble. The battery is all right. When I put my foot on the starting pedal it will not crank the motor, if I use the crank handle and turn the motor over about eight times, then if I use starting pedal, it cranks the motor all right. At the same time, the motor runs in good order.

6—Kindly tell me how to adjust the brakes on the rear wheels?

Jersey City, N. J. S. B. S.

—Four power strokes to a revolution in an eight and six power strokes to a revolution in a twelve.

2—There are always two strokes to a revolution regardless of the number of cylinders for each piston.

3—The cams always operate at one-half crankshaft speed in a four-cycle motor.

4—This depends upon the individual timing. It will generally happen that the intake valve will open somewhere near 5 deg. past upper dead center and close at somewhere near 25 deg. after lower center and the exhaust valve will open about 35 deg. before lower center and close at just a little past upper dead center.

5—It may be possible that there are some short circuits which are draining the battery or it may be that the generator is not charging properly. Be careful to keep the specific gravity of the electrolite in accordance with the instructions of the battery maker.

6—You do not mention the make of car therefore it is impossible to give specific information. The brake adjustment should be tightened sufficiently to give a firm application of the brake without allowing the brake bands to drag on the drums when the car is in ordinary use.

No Colored Running Lights Prescribed

Editor THE AUTOMOBILE:—Please publish which is the correct placing of red and green side lights on cars? Also the relative visibilities of number on license plates; e. g., black on white, white on black, red on white, etc., etc. A list appeared some time back.

Atlanta, Ga. E. McD.

—There is no such thing as the correct placing of red and green side lights on cars as the rules of the United States Government on the carrying of correct marine running lights do not apply to any form of land vehicle.

THE AUTOMOBILE has no record of any such list as you mention.

Packard Made 102.25 M.P.H.

Editor THE AUTOMOBILE:—What rate of speed did the Packard Twin Six make at a trial some few weeks ago?

2—Was this equipped with regular gear ratio as well as a regular stock motor or were there special gears used in this test?

Jeromeville, Ohio. C. L. E.

—As stated on page 847 of THE AUTOMOBILE for Nov. 4, the Packard car you mention made 102.25 m.p.h.

2—The gear ratio was changed. This was a stock car in every particular except that it used a racing body, the timing was changed for high-speed work, the pistons were arched on top to give higher compression, a double Zenith carbureter was used and the rear axle was geared to give 34 m.p.h. at a crankshaft speed of 900 r.p.m.

Burman's Record Still Stands

Editor THE AUTOMOBILE:—What is the fastest a man ever travelled in what, and where?

2—What is the fastest ever travelled on a motor cycle?

3—What is the fastest time made in a Packard Twin Six stock car, what body and number of passengers?

4—What is the fastest time made in a Packard Twin Six stripped chassis and stock car?

Charlottesville, Va. C. E. S.

—The fastest a man ever traveled, and lived to tell of it is 141.73 m.p.h. This record was made by Bob Burman in April, 1911, at Daytona Beach, Fla. The car used was the Blitzen Benz. The mile was traveled in 25.40 sec.

2—THE AUTOMOBILE keeps no record of motor cycle records.

3—The fastest time that the Packard Twin Six stock car ever made as far as official timing is concerned is 72.7 m.p.h. for 10 miles. This was with one passenger with top and windshield on the car. The top was down but the windshield was up.

4—The time made by the Packard Twin Six stripped chassis at the Sheepshead Speedway was 102.25 m.p.h.

Sign Your Inquiries

The Rostrum is in receipt of a number of inquiries which are either unsigned or signed by initials only. All letters to be answered by this department must bear the signature of the sender as an evidence of good faith, although *in publishing* only the initials are given.

The History of the American Automobile Industry—8

Completing the Narrative of Early Endeavors in the Steam Automobile Field —Public Grows More Accustomed to Self-Propelled Road Vehicles

By David Beecroft

AT that time, even bicycles were causing considerable trouble to horse drivers whose horses were as nervous as themselves and a number of farmers threatened the Smith company with suit if it did not keep the motor vehicle off the roads. Smith, therefore, had it stored in the loft over the pattern shop until people got ready for it, as it was probably 20 years ahead of the times. The Smith machine was afterward destroyed without further test, Mr. Smith having died before the patent was issued.

Whitney's Practical Ideas

In considering the activity of advocates of the steam automobile, the successful efforts of George E. Whitney were very largely the immediate forerunners of the work of the Stanley brothers, through whom the steam vehicle finally was introduced successfully to the public. During the years preceding 1898 Whitney operated several very successful steamers substantially like that of the Stanleys. These little vehicles, driven around New England, went far to accustom people to the steam vehicle idea and prepare them to receive it when placed on the market. While it is true that Whitney was indebted to Roper, Copeland and Bullard and probably others for the ideas embodied, it is also true that he put these ideas in the most thoroughly practical shape and demonstrated them so successfully that a casual observer could see little difference between his vehicles and the products that followed in the next few years.

All told, he built seven cars in 3 years. He gave preference to bicycle wheels and pneumatic tires, tubular steel frames and chain drive. His fifth vehicle had 30-in. front wheels and 34-in. rear wheels with 2-in. pneumatic tires. It had a boiler that was 14 in. by 20 in. and contained 340 ½-in. copper tubes. One of his vehicles ran from Boston to Hartford, a distance of 142 miles, in less than 8 hr. in Sept., 1897, an average of 17.7 m.p.h., and he exhibited two of these carriages at the Charles River Park, Boston, Mass., in the fall of 1898, where the steamer first successfully attracted the attention of the public.

Other Steam Vehicles

One of the interesting vehicles entered at the Chicago *Times-Herald* exhibition and contest in 1895 was a little attempt at steam propulsion by A. C. Ames of Chicago, Ill. This vehicle was nothing more or less than two ordinary bicycles, the cranks of which formed the crank-shaft of a steam engine. That the engine might be small the cylinder bore was 1¾-in., with a stroke of 13 inches. The boiler capacity looked inadequate but such a light vehicle did not require much power to propel it. Aside from being exhibited at this first American automobile event this Ames construction seems not to have had much influence on the industry. Like one of A. L. Riker's early electric experiments it carried a vehicle body on springs between the cycle frames, and its total weight was said to have been under 400 lb., which was extremely light considering that the body seated four people.

The Simonds Design

A fairly successful attempt at constructing a steam car was made in 1893 by C. L. Simonds, an engineer of Lynn, Mass. This vehicle carried two people mounted rather high, the frame being under cut so that the front wheels could turn on a continuous axle as in a horse vehicle. At the rear was mounted a vertical boiler and the control was a hand wheel at one side just back of the seat where the operator could reach it. It used wire wheels but was not of the later accepted design and probably saw no great amount of service.

A couple of years later Dr. F. L. Sweaney of Philadelphia, Pa., had a steam car built by the Charles S. Caffrey Co. of Camden, N. J.

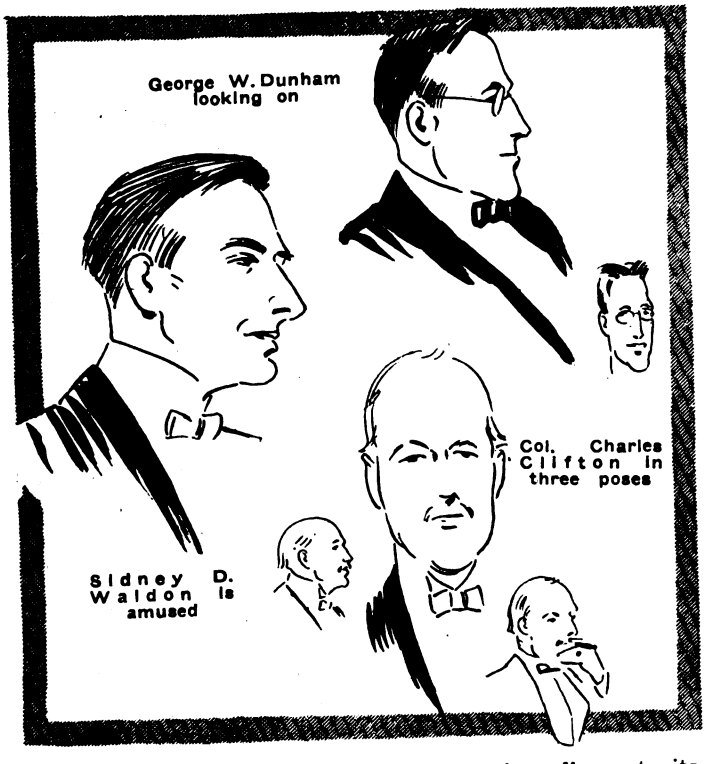
Public Assumed Failure

There were many other sporadic attempts throughout the country during this period but for one reason or another they were not followed up. Not knowing the reason for their non-continuance the public very naturally assumed them to be failures, and this, as much as anything, was responsible for the slow growth of favorable opinion in the minds of the public concerning the motor vehicle.

In most cases these pioneers did not lose faith but later appeared more or less actively in the industry, Dr. Sweaney, for example, being afterward the owner of the first Winton car taken to Philadelphia.

450 at Detroit S. A. E. Banquet

Enthusiasm and Striking Co-operative Spirit Pervades Record Representative Gathering of Men Prominent in the Industry—Talks by Chas. Clifton, W. H. VanDervoort and I. F. Marcosson



DETROIT, MICH., Dec. 9.—As a fitting climax to its activities of the year, which have been the most successful in its history, the Detroit Section of the Society of Automobile Engineers held a monster banquet to 450 automobile manufacturers, engineers and other representatives of the motor car industry here to-night. It was a big affair, not only in point of number, the guests swelling to overflowing the banquet hall of the Ponchartrain Hotel, but also in the striking enthusiasm and co-operative spirit which pervaded the entire assembly.

A Notable Gathering

Many well-known automobile men were in attendance including officers of the national S. A. E. and other big men in the industry. President W. H. VanDervoort acted as toastmaster and at the speakers' table there were among others C. W. Nash, president General Motors Co.; H. M. Jewett, head of the Paige-Detroit Motor Car Co.; Howard Marmon, Nordyke & Marmon; Col. Charles Clifton, head of the N. A. C. C.; Coker Clarkson, general manager S. A. E.; John F. Dodge, Dodge Bros.; W. C. Anderson, Anderson Electric Car Co.; Arthur B. Cumner, S. A. E. Council; David Fergusson, Pierce-Arrow Motor Car Co.; W. E. Flanders, president Maxwell Motor Co., Inc.; Christian Girl, Perfection Spring Co.; Earl Holley, Holley Bros. Co.; E. W. Lewis, Timken-Detroit Axle Co.; Isaac F. Marcosson, business writer; Wm. E. Metzger; C. S. Mott, Weston-Mott Co.; Thomas Neal, General Motors Co.; C. A. Pfeffer, Chalmers Motor Co.; C. B. Rose, S. A. E. Council; J. G. Rumney, Detroit Steel Products Co.; W. R. Strickland, Peerless Motor Car Co.; R. H. Spear, Scripps-Booth Co.; John Utz, Perfection Spring Co.; S. D. Waldon, Cadillac Motor Car Co.; W. E. Scripps, Scripps-Booth Co.; Artemus Ward, Jr., King Motor Car Co.; Percy Owen, Saxon Motor Corp.; George W. Houk, Houk Mfg. Co.; J. W. DeCou, Jeffrey Co.; H. W. Alden, Timken-Detroit Axle Co.; Fred Haines, Regal Motor Car Co.; Harry Bassett, Weston-Mott Co.; George W. Dunham, consulting engineer; F. E. Moskovics, Nordyke & Marmon; Lee Anderson, Hupp Motor Car Co.; W. C. Rands, Rands Mfg. Co.

The above are some of the stars at the speakers' table, acting as a sort of bodyguard for Toastmaster VanDervoort. This is without doubt the most representative gathering of automobile men ever assembled in Detroit and their presence gives fitting proof of the rapid strides that the Society is making not only nationally but locally as well.

The speakers of the evening were in addition to the toastmaster, Col. Charles Clifton, whose topic was Engineering Co-operation; Nicolas Kouznetzoff, representative of the Russian government, who greeted the gathering in his native tongue; James Schermerhorn, publisher of the *Detroit Times;* Isaac F. Marcosson, whose subject was "The War and Business"; Arthur Nealey, the boy president of the Illinois Model Aeroplane Club of Chicago, who made some prophecies regarding the future aeroplane and entertained the staid business men with the flights of toy flying machines.

A Plea for Co-operation

President VanDervoort, before introducing the first speaker, took the occasion to plead for greater co-operation between the manufacturers and the engineers who design their cars. He said he could think of no better Christmas present to worthy employees than to give them a membership in the Society. He further asked that special attention be given to communications from the Society to the end that the interests of all might better be served.

In his opening address Mr. VanDervoort also brought greetings from the new Mid-West Section which was organized last week in Chicago. He expressed himself as being astounded at the vigor and vim shown by the Detroit Section and said that it was very gratifying to the Society as a whole. Push and co-operation must be the aim in order to make the automobile industry the greatest in the world.

Standardization and Progress

"You are all interested in the work of the Society of Automobile Engineers, either directly or indirectly," said Mr. VanDervoort, "and we are extremely anxious that this interest shall develop far beyond the passive point. When called upon for financial assistance, you have readily responded here in Detroit, and elsewhere. You have given us liberal appropriations, through the Automobile Chamber of Commerce, for carrying on the standardization work of this Society. But financial assistance is not all that the Society of Automobile Engineers wants. It requires your interest in its work, and your appreciation of the results. This Society has come to be a very necessary factor in the development of this greatest of American manufacturing industries, and we desire the unqualified sympathy and support

of those high up in the management of the affairs of these great manufacturing institutions.

"The present highly developed state of this industry is very largely due to the standardization work of the Society of Automobile Engineers. Through its efforts, duplication of effort is being eliminated, and the standardization of parts, materials and design has made possible great economies in the production of automobiles. I wonder if we fully realize the enormous financial savings we have received from this standardization work. I fear that the efforts in this direction are not as keenly appreciated at all times, as they should be.

"You ask how you can help in this work. It is simple. Join the Society as an associate member, if your engineering qualifications do not permit your coming in as a regular member. In so doing, remember that the Society is working directly for your benefit. We cannot expect you to devote any considerable amount of time talking about the merits of this Society."

Col. Charles Clifton briefly summarized the early performances and contests of automobiles as an introductory to his main topic. One generation ago the experimental automobile made its bow in America, he said, and 20 years ago Thanksgiving Day there was a so-called race in Chicago. To qualify, the machines had to cover a 33-mile course in 9 hr. None of them did it in 9 hr., but the prize was awarded anyway because it was bad, snowy weather. He contrasted that early performance with the ability of the automobile of to-day. The thousands of motor vehicles in use to-day are an example of the greatest co-operation the world has ever known. They are the result of co-operation of human instincts and Col. Clifton holds that this spirit of getting together for united effort must continue to grow as the industry grows. He paid special tribute to Detroit when he said that whenever anyone sees an automobile, he thinks Detroit. He pronounced this relationship the greatest any city ever had.

B. V. Constantinoff, interpreter for Nicolas Kouznetzoff, Russia's representative, spoke for his principal and greeted the American engineers on behalf of his people. "America now," he said, "is a heart of automobiledom, and he wants us to bring some business to Russia. "We need you there, and you think so little of us," he said.

Mr. Schermerhorn, after a series of rapid-fire moral lessons and as an entertaining mixture of humor, paid tribute to Henry Ford when he said: "In your hearts you should be thankful that your industry has produced the man to head the peace expedition which has set forth with an honest desire to bring about peace. Fanciful, unpractical, fanatical, and all, it may be, but despite the criticism, it is sincere."

Mr. Marcosson, in his authoritative talk on war and business, told the manufacturers that they must prepare for a gigantic trade war with Europe at the close of the present great conflict. He struck deep at the impairment of our goodwill with foreign countries, by sending them in their hour of need inferior merchandise for the sake of enormous profits. He warned the country to be prepared industrially.

Extracts from Mr. Marcosson's speech follow:

What the War Means to Us

"The war is the ill wind that blew us good. Before Europe saw red we were in a bad way, as you and I knew, to our cost. Our business had been legislated, 'investigated,' commissioned and regulated almost into extinction; capital was wary; panic hovered.

"Then this war crashed into commerce, paralyzing trade, stifling credit, choking up the channels of communication. Yet the world had to be fed and clothed and armed. We alone stood at the universal trade counter ready to do business, and we did it. A frenzied prosperity fell into our laps. The era of the war order began.

"But the plain truth of the matter is, that while we have capitalized a great prosperity out of the war, we, as a commercial people, have been very short-sighted. We have only seen the profit of to-day and lost sight of the permanent gain of to-morrow. We have been speculators where we should have been investors; we regarded a vast world trade opportunity as an expediency rather than an asset. We have sold goods instead of good-will.

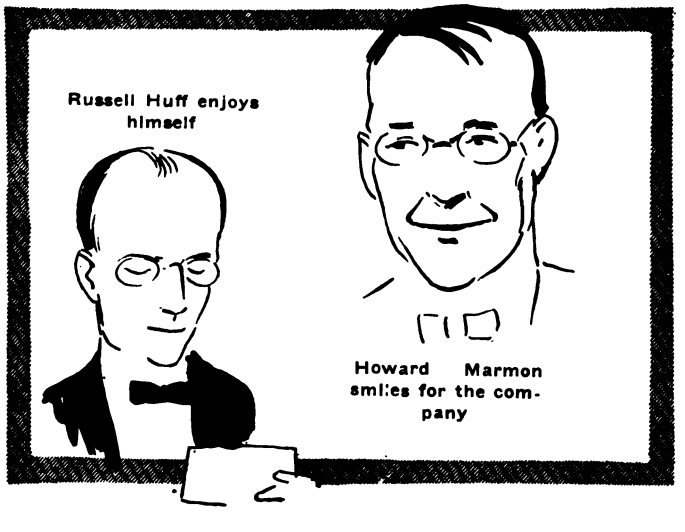
Automobile Quality High

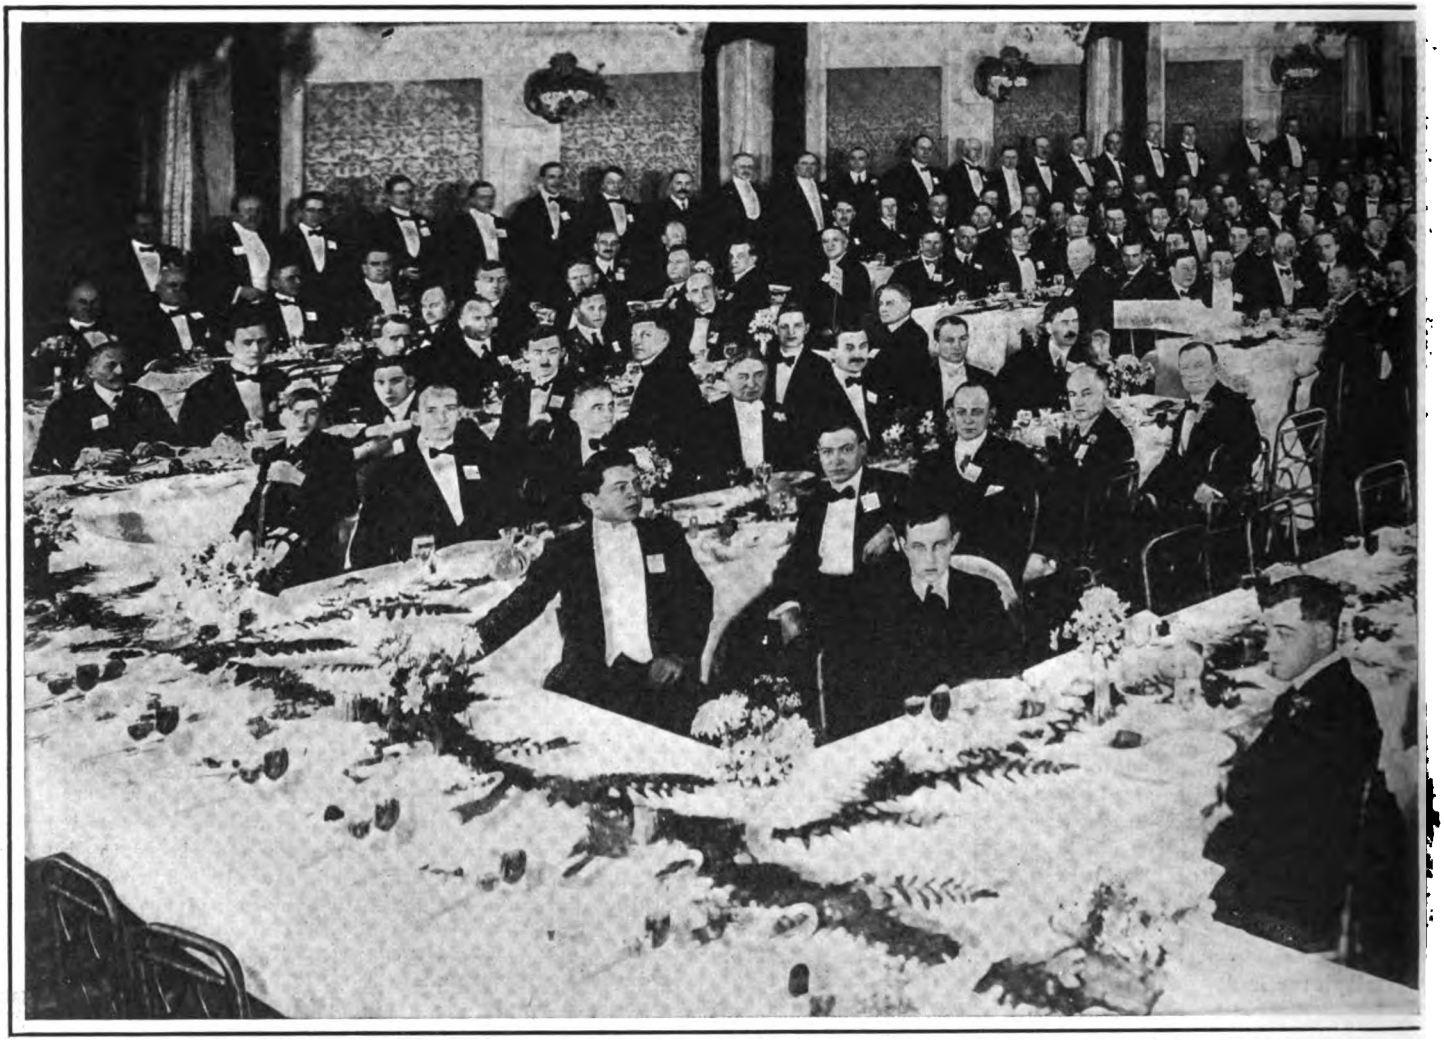
"And let me say right here that in all the stream of exports that has rolled up a foreign trade of over five billions of dollars in twelve months the one product that has maintained the standard of its integrity, whether for mission of mercy or destruction, in fair weather and foul, is the American automobile. It has been 100 per cent efficient every time, and you may well be proud of the record you have made.

"But this European business is only one phase of our commercial short-sightedness in such a crisis. Take South America. Here is a region bound to us by sentimental and geographical ties that could have been the easiest of commercial fields if we had taken the trouble really to study and prepare for its exploitation. England, France and Germany did it. When Germany wanted to invade that region she first sent men who studied the language; learned the customs and needs of the people. When she shipped goods it was goods that the countries wanted and kept on wanting. *We* were content to send a sporadic salesman with samples.

Germany's Forethought

"The war cut off South America from the source of supplies





Banquet given by the Detroit section of the Society of Automobile Engineers to 450 manufacturers, engineers and other

and money. We were too busy capitalizing a temporary opportunity to develop what was a permanent asset. Here is an example: One of the South American countries got rid of a president, and because of the decrease in import duties, due to the war, needed a loan. Vainly she tried New York. Do you know who produced the money? A German commission house in her capital city. The nation behind this house was at war, a war that menaced its life. Yet she was wise and far-sighted enough to buy some good-will with that loan. It will return a thousandfold after the war.

"These, and many other instances that I could give, show clearly that we have not definitely and deeply regarded this war as a permanent opportunity; it means that if we do not readjust our whole policy we will find ourselves isolated and alone when a merciful peace sheathes the sword and the world becomes normal again.

"If there is one message above all others that I would bring home to you it is this: Let us not deceive ourselves about this present war-time prosperity. What seems the easiest of selling now is but the prelude to the bitterest trade war that the world has ever known.

"No man can visit England now without feeling that in more ways than one we have lost prestige irretrievably. This loss of respect will inevitably be followed by loss of trade.

"She buys our goods now because she must. But this toleration of necessity will be followed by indifference, even trade hostility when peace comes, in a bitter trade reprisal.

England's Trade Reprisal

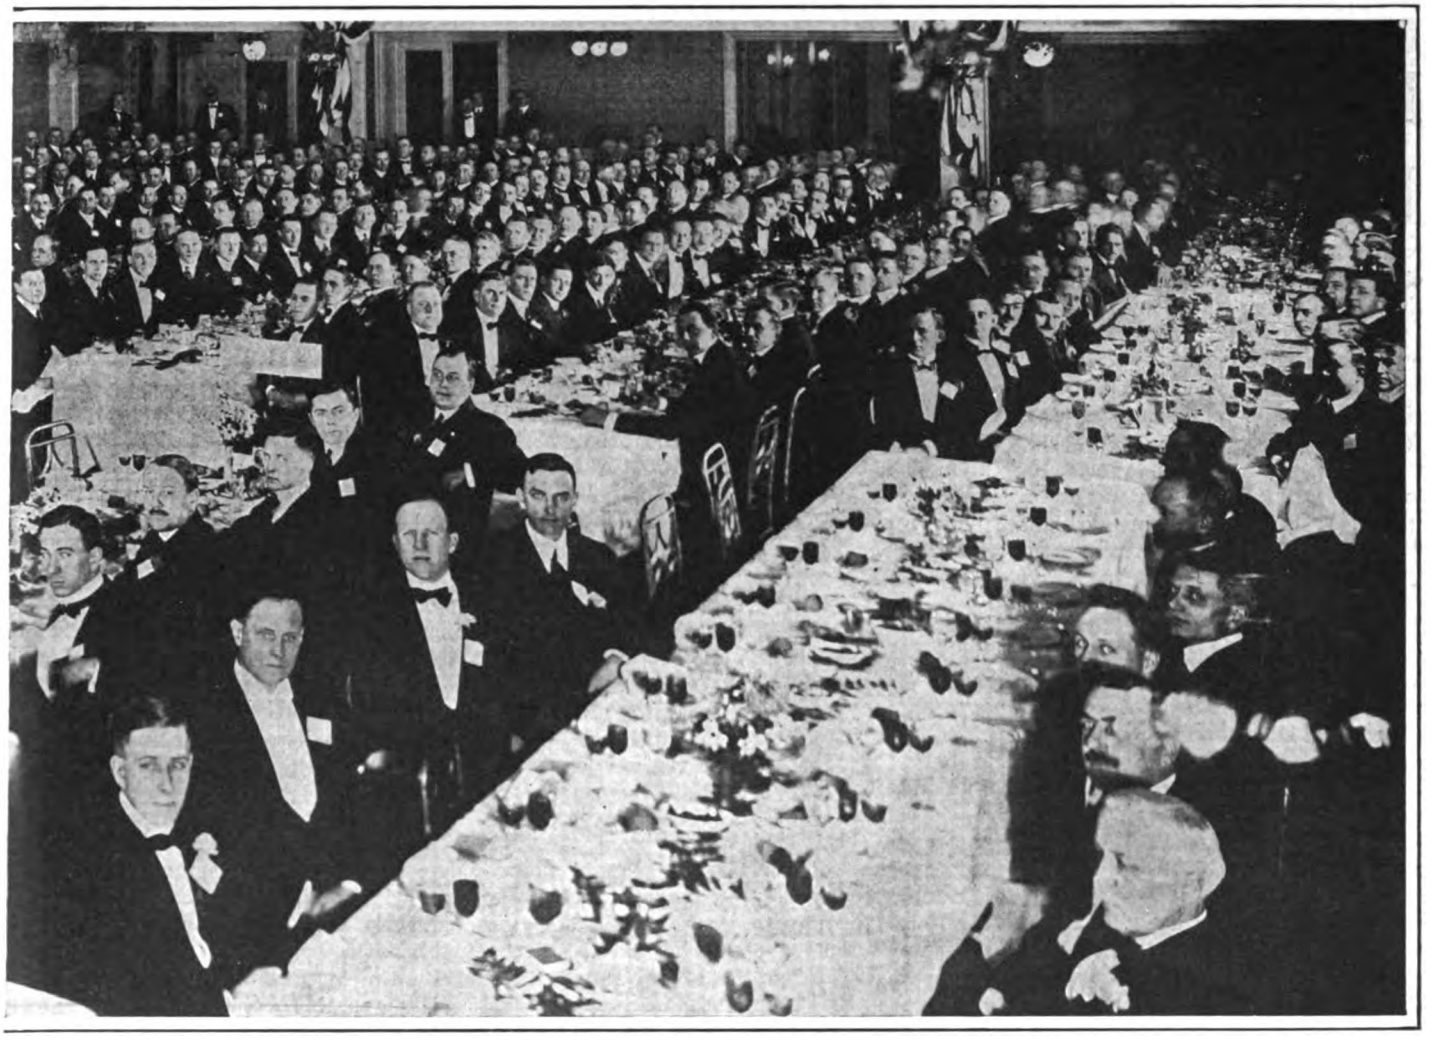
"And England will be equipped to make this reprisal as never before. Every turn of the industrial wheel in that galvanized and speeded-up Britain is full of significance for all of us. I have stood in her shell factories watching the forest of American-made automatics whirl and hum as they turned and beveled the cases that were soon to scatter death and terror on a hundred hard-fought fields. Half the population of the Kingdom is at work on this job; practically every lathe is on war work. And new factories are literally springing up over night.

"This huge and well-oiled machine, that works 24 hr. out of every 24, has a meaning for us far beyond its steady flow of munitions. In this perfectly organized industry, geared to highest efficiency, is the instrument for Britain's industrial regeneration after the war. Quantity production of ordnance now will mean quantity production of a hundred things, from small motor cars to safety razors, as soon as peace comes.

"Backing this is a national spirit of revolt against imports. 'What can we do without?' is the slogan that is now hitched up to the cry of 'Down with imports!' The war is teaching England what it has already taught Germany—the supreme lesson of self supply—and we will find it out to our cost in a diminished export on the one hand and a fierce trade war on the other.

The Cheap Labor Problem

"So, too, with France. One incident will illustrate. There is in the United States to-day a French Industrial and Commercial Commission, sent to buy machinery for the replenishment of the devastated factories of the North Country. Now it will be a good piece of business for us to sell $1,000,000,000 worth of machinery to these people.



representatives of the industry at the Pontchartrain Hotel on Thursday, Dec. 9, as a climax to the activities of the year

"But what else will it mean? These machines, and others that we will ship for some time to come, are for factories that in the main have employed hand labor—labor that only costs from 50 to 80 cents a day. What will happen when the war is over and the host of fighting men return to peaceful pursuits? Labor will not be dear; it will be cheaper.

"And what will happen? This cheap labor will be engaged in quantity production for articles that will meet ours in the great open market of world trade. The 50-cent worker on an American automatic in France will compete with the $3 to $5 a day worker in our own land. You don't need a diagram to tell you what product will be the cheapest, and what product the colonies will use when backed up by an efficient system of foreign trade development.

"No matter how the war ends, Germany will be an immense factor in this readjustment of world business. Mistress of efficiency in peace and war, she will not be long in striking her stride. Already she is buying the munitions for this new offensive of peace, and they are being bought in this country; agricultural machinery, vast quantities of raw material, all to be rushed to the home country as soon as the seas are free.

"Nor will quantity production and all its by-products be our only menace after the war. The hatreds that are now being fought out amid screaming shot and devastating shell on the battlefield will continue long after the smoke clears away. The nations that have fought together will trade together. Even those who are now fighting each other will find a community of trade interest because politics must inevitably enter into the new commercial alliances.

"Unless I am much mistaken, the United States, because of the rich harvest that it has reaped out of the war; because of the accepted belief abroad that our neutrality is a failure; because of our economic short-sightedness, will find itself almost isolated. Are we to become a commercial Ishmael with the economic hand of the world raised against us? It is a plain, blunt question, but it is well worth asking.

"But there is a remedy, my friends, a remedy that lies in a preparedness as important in its far-reaching effect on the great mass of the American people as is the defense of our hearth and home.

United States Must Standardize

"We need an adequate merchant marine; we must conclude new commercial treaties before the war ends in which we capitalize the supremacy that the world's need of us creates; we need a more complete system of international finance in which dollar credit goes hand in hand with the dollar product; we need some of the spirit of sacrifice that is animating the countries at war, for out of its fiery ordeal there will come a new and more efficient Europe. We need a business statesmanship that will put business advance above petty politics and will offer no barrier to legitimate enterprise."

Toy Aeroplanes Demonstrated

It is doubtful if the demonstrations of indoor flying of model aeroplanes was ever better carried out than by Arthur Nealey, who has made a study of the construction and operation of the model flyers. These tiny aeroplanes, which were made by Mr. Nealey, flew the length of the banquet hall, and some of them looped, while a model hydroplane was made to rise and fly from a basin of water with a run of only 10 in.

Reclaimed Scrap vs. Cheap New Rubber

PRICES for scrap tires have fallen to one-half of those ruling two years ago. In this fact there is indicated certain new and interesting relations between the rubber reclaiming industry and the tire industry. The principal reason for the lower value of the scrap seems to be that the reclaimed rubber is no longer used as an ingredient in new tires to any considerable extent and that the new uses which have been developed do not justify the old prices for the raw material. Much is now used for flooring materials, it is said, and for insulating compounds. The place formerly taken in new tires by reclaimed rubber is now taken more and more by inferior new plantation rubber and the low grades known as jelutong and almadeina, the prices for which are constantly going down and which, after all, are much more plastic and valuable for tire purposes.

Scrap Supply Reduced by War

While this is the general situation, there is at the present experienced a hardening in the prices paid for scrap tires, but this upward tendency seems to be only transitory and mainly due to the special conditions caused by the war. America is the foremost rubber-reclaiming country. Only during the last decade have reclaiming plants founded on American practice been established in England, where there are now four of large size, and Germany is farther behind, having bought increasingly large quantities of reclaimed rubber every year from both England and America until the war broke out. The prize of 100,000 marks offered by Germany for a really satisfactory reclaiming process testifies to her desire for an independent production in this line as well as to small faith in the widely announced methods for synthetic manufacture of rubber substitutes. The American mills, which formerly worked mainly with discarded rubber shoes and still make full use of this supply, now gather scrap tires not only from domestic sources but also from Europe. For the fiscal year ending June, 1914, about 20 million pounds of tire scrap were imported from European countries, according to the figures of the Department of Commerce of the United States, but for the year ending June, 1915, the imports were reduced to 4,286,195 lb., showing the effect of the war and perhaps also the effect of the lower prices paid. The incentive and the facilities for gathering the thousands of tires which are used up in the warfare are lacking, causing a temporary shortness in the supply, but on the other hand it is naturally to be expected that the close of the war will see the market glutted with the enormous quantities of tire scrap which must be piling up in different places near the war zones of the continent.

In considering the question whether the reclaiming industry is doomed to eventual collapse, *The Engineer* (London) arrives from these and other facts at the conclusion that reclaiming will remain an important branch of the rubber industry at least until new rubber is freely offered at 25 cents per pound, and in this connection it presents in its issue of Nov. 5 an account of the purposes and methods in the reclaiming of tire scrap which will be found of general interest.

The Commercial Object

Generally, the object in reclaiming vulcanized rubber scrap is to convert it, in so far as possible, into its original unvulcanized condition, so that it may be cast or formed in molds and revulcanized. But vulcanized rubber is insoluble in all solvents, whether it consists merely of rubber and sulphur or is heavily compounded with mineral matter, such as chalk, barytes, litharge, zinc oxide, etc. It may also contain organic additions such as oil substitutes, mineral oil, vaseline and pitch. Cotton fabric and wire are prominent components which must be removed.

In practice the aim of the large reclaiming works is simply to produce a substance for which there is a steady demand, rather than to attempt competition with the rubber planters in India and Africa, who now in many cases have got their local production cost down to 20 cents per pound for new rubber and eventually will be able to offer it in the markets of the world at a very modest figure. Even if it were found practicable to perfect the reclaiming methods technically to the point of producing from the scrap an equivalent for new rubber, it is evidently more than doubtful if all the impurities of the scrap may be removed so economically as to make such a refined output compete with the natural product. When nevertheless reclaiming works are not dismantled but, on the contrary, new ones are constantly erected, it is plain that the aim is no longer to arrive at a relatively pure rubber material of value as an ingredient in new automobile tires but to produce a plastic substance commanding its price for other less exacting purposes; and this observation explains also the stadily declining prices paid for scrap tires in conjunction with the continued demand for them and the slight increase in present quotations.

Chemical and Mechanical Methods in Reclaiming

In spite of numerous patents, only two methods for reclaiming rubber scrap have achieved any real success, one the acid and the other the alkali process. The acid process is the older and is still the more extensively used one, especially in the United States. By this process the scrap is first ground between steel rollers and thoroughly washed to remove dirt and metallic fragments. It is then treated with dilute sulphuric acid in tanks heated by steam, until all the canvas is destroyed. The rubber is then removed and washed separately to free it from acid, and the next process consists in heating it in live steam at about 300 deg. Fahr., either alone or mixed with mineral oil, after which it becomes softened sufficiently to remain plastic after a thorough drying, so that it can be sheeted on rollers.

By the alkali processes, some of which are controlled by patents, the canvas of the tire scrap is destroyed by a caustic soda solution at high pressure, and the softening of the rubber goes on at the same time, dispensing with subsequent heating. The method has the advantage that the caustic soda removes all oil substitutes as well as all free sulphur and the rubber resins.

By both methods, all operations are automatic after the first grading of the material. A more definite idea of the work can be gained by following its actual sequence at one of the modern mills, as follows:

Sequence of Operations

The scrap, after grading, is broken up, small enough to pass a ¾-in. screen, between fluted horizontal steel rollers which are about 4 ft. long and revolve inwardly at varied speeds. The next step is to remove metal fragments, and for this work a magnetic separator is used, whereafter the rubber is ready for the digesters or de-vulcanizers. These are steel-jacketed pans of cylindrical form and varied capacity. After the rubber and the caustic soda solution have been put into them, the manholes are tightly fastened and high-pressure steam is turned into the jackets. This process lasts several hours at between 300 and 400 deg. Fahr., until all canvas is destroyed, whereafter the contents of each digester, whose capacity is rarely less than two tons of rub-

ber, passes to special washing machines which remove the dissolved canvas, dirt and oily matter. The rubber, swelled with water, now passes to a mechanical water separator or draining machine where the bulk of this water is removed and and thence to vacuum driers which remove the rest of the moisture. From these driers the rubber comes in the form of crumb, and this is worked for some time on mixing mills, finally forming into homogeneous sheets. Two sets of mills are employed, one the same as used for fresh rubber and the other made with shorter rollers of larger diameter and working under higher pressure, so as to make sure of breaking up any granulated formation still occurring in the mass.

"The Car That Stays Young"

An Incipient Department for Data on Durability

APPARENTLY the popular trend of thought on durability runs irresistibly toward those features in the construction of a car which have always been most talked about; namely, the machinery parts. And these are precisely the parts with regard to which it may be said that all data on durability are smothered or complicated by a multitude of theory and operative considerations, but nowise neglected in practice. The two accompanying letters on the subject are both in this vein. In one of them the expenditure of $2,000 to provide a new dress for a 1909 chassis is mentioned as a means successfully employed for making the car continue to appear "young." But the intended object of this column is not to glory in the chassis which outlasts its body work, but rather to collect facts which will show how the stationary parts of the car may be made to give satisfactory service as long as the machinery parts on which nearly all competent attention has been concentrated in the past; in other words, in the case just referred to, how the the expenditure of $2,000 may be avoided, reduced or delayed without loss of style or service. By degrees this phase of the subject, though knowledge of it is composed of many odds and ends not so far collected in one place, may perhaps come into its rights. Meanwhile the views on durability which are actually entertained in the industry and among the public are not without interest.

Editor THE AUTOMOBILE:—The following outline of facts relating to Hyatt bearings may interest readers of your columns on "The Car That Stays Young."

In every motor car there are some parts which are constantly subject to wear. Eventually they must be replaced. In the building of such parts, the engineer's aim is to produce such high quality as to guarantee long life, with a minimum expense for replacement when that replacement finally becomes necessary.

The Hyatt flexible roller bearing, due both to its principle and its construction, offers an example of how such a difficult problem may be solved.

Loads carried on Hyatt bearings are distributed over the entire length of the bearing roller which has the ability to flex very slightly. Under certain conditions, therefore, it is possible to operate a Hyatt roller bearing directly on a surface which is considerably less hard than is ordinarily required for bearings made of solid rollers or balls.

Naturally, the proper attention must be given to the relation between the bearing sizes, the loads imposed, and the hardness of the surfaces involved. For the most severe applications, the inner and outer races provided with the bearings of the Hyatt flexible roller type are hardened to a point comparative with ball bearing usage. For other places, where the bearing proportion and lighter loading make it possible, an outer race is furnished which is not quite so hard as the races previously mentioned, and is less expensive to manufacture. These races, for their particular duty, are entirely practical and satisfactory in operation and at the same time they may be replaced at lower cost when they have suffered the wear which is bound to occur, because of the greater hardness of the rollers.

There is a temptation at times for the car manufacturer to omit entirely both inner and outer races, and to operate the rollers directly upon adjacent units. For example, the bearing rollers might be operated directly upon the tubing in an axle housing. If this tubing could be made so tough and hard that there would be no wear, of course something would be gained in bearing cost. Such a construction, however, appears to be almost impractical, whether it is contemplated to use the tubing as an outer race or, in connection with floating wheel hub bearings, as an inner race.

It has been found quite practical to heat-treat solid shafting of alloy steel so that it may be satisfactorily used as a bearing race. This construction is widely used in connection with Hyatt bearings, particularly in transmissions or gearboxes.

The engineering department of the Hyatt company approves such applications only when the ultimate cost to the consumer is given as much consideration as the first cost to the manufacturer.

A certain manufacturer at one time operated the bearing rollers directly against the tubing in the axle housing, in connection with a semi-floating wheel hub application. Recently he was convinced, after some argument, that the sensible way to keep his car "young" at this particular point was *not* to omit the outer race of the Hyatt bearing for the sake of the small first cost.

Usually we find that the slight saving in first cost by omitting the hardened and ground inner and outer bearing races is more than offset by the loss of ability to withstand wear. Very fortunately, however, more and more motor car manufacturers are seeing this in the right light.

Detroit, Nov. 29, 1915. CLIFF KNOBLE.

In the following letter our easy distinction between "young" and "new" is thought needful of explanation.

Editor THE AUTOMOBILE:—As to "the car that stays young," I think that it must be conceded that there is a good deal about it that is psychologic in character. Are all of the cars OLD which we speak of, and think of, as being old? Just as it is with the garments which we wear; to look right we must don modern clothes, and to keep a car young we must be able to furnish it with a new suit for appearance sake. In 1913 it cost Bill Grandin about $2,000 to get a new party dress for the old 1909 (* *) chassis. But it was worth it. That chassis was not old, although it had been driven 60,000 miles over rough country. With the new dress, and paint, and the streamlines, and the chassis rebushed, that car is to-day quite young, and will be young when the debutantes of to-day have succumbed to *locomotor ataxia* or *paralysis agitans*.

I have a little, modest, 15-30 (* * *) car which is now six summers, five winters, and 30,000 miles old. She wears the original suit of clothes dyed over. Her back hair is different and the skirt and sleeves are criticized by the fashion editor, and she does not go to parties because she has no evening dress suit, but she is not old. Her heart, lungs, digestive system, are perfect and she can show most of them how to run and jump, and she comes in laughing, eats and sleeps well, and gets up in the morning with a clear brain.

Back in 1912 it almost seemed that it might be nice to exchange this same little lady for a fresh flame selling at $1,800, or so. but she was kept in the harness and properly groomed. When 1913 came the fresh-looking flame of the year before could not be considered as a match for the little girl, now in the senior class.

About a month ago I spent a week in Boston and saw the crowds of automobiles. It seemed to me that all of the output of the one special factory must have gone into Boston. They ranged from the newest creations back, at least as far as 1909. But how sweetly they all ran! No matter how old, or how it was dressed, it showed class. Those cars stayed young. You don't need to tell me that the present day cars are made of better stuff! I don't believe it.

I saw a rear axle in one of the modern creations go up a few days ago. The stuff that was in that assembly was a crime. And they would have wanted $1,000 to trade that beast for my Molly.

I am glad that Mr. Osborne draws attention to the question of lubrication. The designers have given it but little attention, and the users think of it still less. There has been a

(*Continued on page* 1109)

Leakage Past Rings 9 Per Cent Water

Collects in Crankcase and Must Be Carefully Watched in Multi-Cylinder Motors

By Victor C. Parker

A GREAT many motorists have been surprised when draining the oil from their motors, to find a pint, or even a quart of water emerge with the oil. Others have never noticed its presence in their motors until it made itself apparent in a lack of lubrication or, in winter, by means of a frozen oil pump. This phenomenon has been the cause of much worry and not a little real trouble to owners and service men alike, and with the advent of the eight- and twelve-cylinder motors, bids fair to become a full-fledged bogey of equal rank with missing cylinders and slipping clutches.

How does the water get there? Where does it come from? You start out with a brand new car, we will say, taking care to strain the gasoline through a chamois and examining the cylinder oil closely for any suspicion of water. You drive a few hundred miles and then remove a drain plug from your crankcase to get rid of sediment and—Presto! you have caught a pint or more of perfectly good water. There is the mystery!

A number of explanations of how and why the water gets into the crankcase have been advanced, and different drivers have observed all the precautions possible. Gasoline has been strained, lubricating oil analyzed, cylinders examined for cracks and leaks, the position of the carbureter intake investigated for the possibility of collecting rain or spray coming through the radiator, and even the garage attendant with his hose and sponge has been looked on with suspicion, but the next time the crankcase was drained, the water would be there as usual.

The explanation, of course, is very simple, once the process of combustion is thoroughly understood, because water is one of the products of combustion in the gas engine cylinder, and its presence is to be expected in every motor, though there are several reasons why certain motors will collect more of it than others.

Combustion Is Oxidation

In the first place, it must be understood that the "explosion" which occurs once every other revolution in each cylinder of a four-cycle engine, is nothing more or less than a rapid combustion of the gasoline vapor provided by the carbureter. From a chemical standpoint, combustion is merely an oxidizing process, by means of which the constituents of the gasoline are combined with the oxygen of the air to form new compounds and liberate a large amount of heat.

Gasoline is a mixture of a number of compounds of hydrogen and carbon, all of which have the general formula $CNH_2N + 2$. When burned with the proper amount of air, the hydrogen and carbon combine with the oxygen to form water (H_2O) and carbon dioxide (CO_2). Hence, water is always one of the products of combustion, and at the temperature of the explosion, exists in the cylinder in the form of superheated steam at high pressure.

Now, no matter how perfectly the piston rings fit the cylinders, or how tight their joints, there is always bound to be some slight leakage of the products of combustion past the rings and into the crankcase of the motor. As the superheated steam enters the crankcase it expands rapidly and cools down until it condenses into fine globules of water on the crankcase walls and eventually finds its way to the lowest point. The carbon dioxide, however, is a fixed gas, and simply passes out through the breather tubes unnoticed, but the water continues to collect as long as the motor runs.

The presence of water vapor in the exhaust gases may also be noticed in the white steam formed at the muffler tail pipe on a cold day, or in the constant drippings from the jackets of carbureters that are exhaust heated.

From the above it may easily be deduced that leaking or ill-fitting piston rings and scored cylinders will allow more gas to blow by, and consequently more water will condense in such motors. It is also true that new motors, in which the rings have not yet had time to become thoroughly lapped to the surface of the cylinder walls, will condense more water than those which have been well run in. It is equally evident that the more ring surface exposed to the pressure of the hot gases, the more chances there will be for slight leaks. This explains why water in the crankcase is more prevalent with six-cylinder motors than with four, and no doubt this trouble will be more apparent in the new eights and twelves than in the sixes, because with the bore-stroke ratio kept constant, doubling the number of cylinders for a motor of a given displacement increases the ring surface, and consequently the chance for leakage, by over 50 per cent.

Carbureter Adjustment Important

But the number of cylinders and the fit of the rings are not the only factors to deal with in considering the amount of water likely to condense in the crankcase. Strange as it may seem, the carbureter adjustment has fully as much or more effect on the quantity of water collected. In fact, it is to the adjustment of the carbureter that we must look for the only available remedy in existing motors. Too rich a mixture means an excessive amount of water in the crankcase just as surely as it means the formation of carbon in the cylinders, a smoky exhaust, and fouled spark plugs, and once this point is properly appreciated by engineers and service men, the presence of excessive amounts of water can be largely avoided, though it cannot be entirely eliminated.

Returning to the chemical theory of combustion, let us first consider the case of a motor running on a perfect mixture. For practical purposes we can use the formula for hexane (C_6H_{14}) as representing the proportions of hydrogen and carbon in ordinary 70 per cent gasoline. We will adjust our carbureter to burn, say 1 lb. of gasoline and give perfect combustion in all cylinders.

The atomic weight of hydrogen is 1, and that of carbon 12. One lb. of gasoline (C_6H_{14}) will therefore consist of 0.163 lb. of hydrogen and 0.837 lb. of carbon. The products of combustion of a perfect mixture, as we have seen, are water (H_2O) and carbon dioxide (CO_2), the oxygen for these compounds being obtained from the air. The other constituent of the air, nitrogen, is generally considered inert and does not take any part, chemically, in the combustion.

To convert our 0.163 lb. of hydrogen into water (H_2O) will require 1.304 lb. of oxygen (atomic weight 16), and to convert the 0.837 lb. of carbon into carbon dioxide (CO_2) will require 2.231 lb. of oxygen, making a total of 3.535 lb. of oxygen required for combustion. But since oxygen consti-

tutes only 23 per cent of the atmosphere and nitrogen 77 per cent, we will have to take 11.835 lb. of nitrogen into our cylinders along with the oxygen, which means that we will use 15.370 lb. of air with our lb. of gasoline, the resulting products of combustion being 1.467 lb. of water (H_2O), 3.068 lb. of carbon dioxide (CO_2) and 11.835 lb. of inert nitrogen. The water therefore forms 8.96 per cent of the products of combustion and this proportion of any leakage past the rings will condense in the crankcase.

Lean and Rich Mixtures

It will be observed that in our perfect combustion we used 1 lb. of gasoline to 15.370 lb. of air, but it is a well known fact that mixtures as rich as 1 to 7 or as lean as 1 to 32 will burn. Now suppose that instead of the perfect mixture we have been using we run our motor on a very rich mixture, say about 1 to 10. What are the results?

In the first place, the size of the carbureter, throttle opening, and speed of the motor will determine the amount of air taken in during a given length of time, and as we should endeavor to keep those conditions as nearly constant as possible, we will enrich our mixture by adding more gasoline to the 15.370 lb. of air used in the first case. As a result, it will be discovered that we have not enough air for complete combustion, and therefore will not obtain the same products as the result of the combustion.

Hydrogen, having a greater chemical affinity for oxygen than carbon, will take out enough oxygen to form water, regardless of the remaining reactions, and as we now have 0.245 lb. of hydrogen it will require 1.960 lb. of oxygen for its combustion, forming 2.205 lb. of water. This leaves only 1.575 lb. of oxygen remaining from the 3.535 lb. contained in our original 15.370 lb. of air, or an amount insufficient for the complete combustion of the carbon, which under these conditions will form the unstable compound carbon monoxide (CO). Combining the available 1.575 lb. of oxygen with carbon to form carbon monoxide (CO) requires 1.181 lb. of carbon, resulting in 2.756 lb. of carbon monoxide (CO) and leaving 0.075 lb. of free carbon, which will either collect on the cylinder walls and piston head or be blown out of the exhaust in the form of a dense black smoke.

In this second combustion we have used 1.5 lb. of gasoline to 15.370 lb. of air, the resulting products being 2.205 lb. of water (H_2O), 2.756 lb. of carbon monoxide (CO), 0.075 lb. of free carbon (C) and 11.835 lb. of inert nitrogen. The water now forms 13.06 per cent of the total, and will be apparent in that proportion in the leakage to the crankcase.

In other words, we have increased the amount of gasoline in our mixture by 50 per cent and the amount of water in the crankcase by nearly 70 per cent.

Incidentally, the rich mixture has further handicapped our motor by leaving a generous deposit of free carbon in the cylinders to cause knocks and overheating, and materially cut down the amount of power by an incomplete combustion.

From the above, it will be seen that water is one of the natural products of combustion in the gasoline motor, and that its presence in the crankcase under certain conditions cannot be entirely eliminated, but that properly fitted piston rings and a proper carbureter adjustment will reduce it to the minimum. In the eight- and twelve-cylinder motors with their largely increased ring surface in proportion to their piston displacement, engineers may yet find it necessary to provide some means for trapping and removing the water before it can collect in the lubricating system.

"The Car That Stays Young"

(*Continued from page* 1107)

lot of talk of keeping the springs lubricated, but *they* do not wear out; but what of the shackle-bolts? Why doesn't some kind person get up some easy and efficient way of taking care of them? Even in cheap cars it seems to me that the spring-eyes could be fitted with bronze bushings and hard shackle-bolts used, so that the replacement of the bushings would be all that would ever be necessary.

The best sort of lubricant for the different parts is not taught as it should be. Mr. C. W. Stratford is the first to give it attention for the public [in S. A. E. paper]. Graphite is not used as much as it should be. I drove an old * * * * 30,000 miles without adjusting the main bearings of the motor, because I used Oildag in my motor oil. Ninety per cent of the people never wash out the crankcase.

Proper care, and even great care, is the price we must pay for the "car that stays young."

W. M. ROBERTSON, M.D., B.Sc.

Warren, Pa., Dec. 10, 1915.

In this letter the names of the cars to which Dr. Robertson refers have been omitted. But if real test data on materials or design details had been offered care would have been taken to identify them completely.—M. C. K.

The Palace of Motoria

THE accompanying illustration gives an idea of the plan of decoration to be used in transforming the Grand Central Palace into the Palace of Motoria for the New York show which is to open at 2 p. m., Dec. 31. Motoria is the goddess who watches over the destinies of the automobile industry and, visualized in statuary, has been a part of the decoration at a number of automobile shows of the past. The goddess stands with hands outstretched upon a steering wheel with her draperies blowing in the breeze.

The Palace will be decorated with 25,000 yd. of maroon velvet festooned in blue and gold, and on the main floor the columns which form the central court are to be treated with blue hangings draped from the bays between the tops of the columns and gathered near the base. The hangings will be edged in gold braid and fringed.

The upper cornice surmounting the columns forming the railing of the second floor will be decorated with a mass of flowers, while the columns on this floor will be treated in Renaissance figures and pergola effects.

Illustrating the decoration scheme for the central court at Grand Central Palace for the New York automobile show

ACCESSORIES

Left—American top for Fords. Right—Heiser valve tester

American Top for Fords

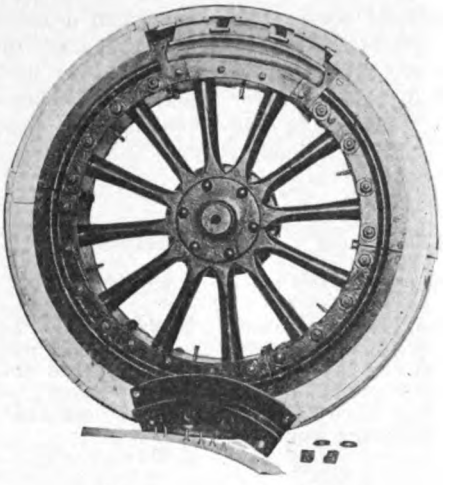
A NEW design convertible top for Fords has been added to the line of the American Top Co., which has three salient features, according to the maker. It is weather-proof and embodies the advantages of the convertible detachable top but weighs much less; it includes a standard one-man type of touring top with Jiffy curtains; and it includes a rain-vision ventilating windshield with cowl, making it adaptable to all Ford models.

It may be installed in about 2 hr. and permanently takes the place of an ordinary top, the mounting of the glass sides for winter use requiring only about 30 min. These glass sides are set in enameled steel frames with heavy tape insertions between glass and frame on both sides, making a noiseless, firm setting. The glass is fastened to the doors by a one-piece steel flange that connects directly with the door and may be quickly screwed into position. With the door glass is included a door lock by means of which the regular Ford lock can be opened from the outside. Doors are all equipped with anti-rattle rubber inserts and fit tightly. The glass partition between the two doors fits firmly to the top rail and at the bottom by a metal flange, and is again attached firmly to the top, the contact being made between two heavy cloth folds so that there is no friction or chance for squeak or rattle. Top material is long-grain English effect artificial leather.

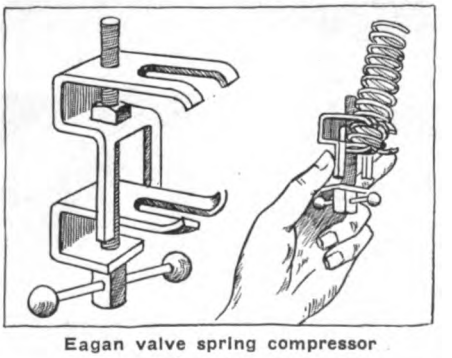
Including windshield, cowl, glass sides and one-man type top with Jiffy curtains, the price is $55. Daly & Co., Detroit, Mich., have exclusive sales rights. —American Top Co., Jackson, Mich.

Heiser Valve Tester

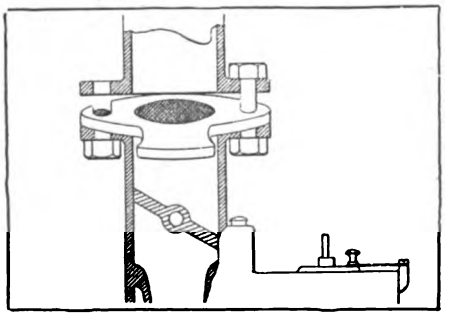
This device is a little reservoir with a funnel at the top and a drain cock at the bottom and in the body an opening which is clamped against the valve port, after the manifolds have been removed, by the same means that are used to clamp the manifolds in place. Gasoline or water is poured into the tester when the valve under test is seated, and leakage past either valve or stem indicates the need of attention. The device can be applied to any valve port not more than 2 in. in diameter. Price, $2.—Heiser Special Tool Co., Kingston, Mo.



Cannes pneumatic wheel



Eagan valve spring compressor



Joswich intake manifold screen

Cannes Pneumatic Wheel

This is a new type of pneumatic wheel which has recently been patented. The wheel has its pneumatic part embodied in the wheel itself and forms an inseparable part of it. The resiliency is obtained, as in the present tires, by inner tubes inclosed in metallic casings. Instead of one casing per wheel, there are six segmental ones absolutely independent of each other and each containing its own inner tube. The segmental casing is formed by metallic side plates bolted to the rim and a metallic shoe sliding between these plates. The shoe is covered with solid rubber at the outside and is prevented from leaving the casing by the plates' flanges. The segmental feature of the tire has the advantage of keeping the radius of the wheel always constant and therefore the centrifugal force is also constant. It is claimed there is no increase of stresses in the rim, neither is there required any additional effort of the engine to overcome the increase of the centrifugal force.

The wheel-tire is puncture-proof and should an inner tube wear out its replacement by a new one is simple and can be made without having to jack up the car.—E. Cannes, New York City.

Joswich Vaporizing Screen

This is a gasket designed for insertion between the manifold and the carbureter, containing a wire gauze screen for breaking up solid particles of gasoline from the carbureter. The gasket has slots instead of bolt holes, so that to insert it the bolts are loosened, not removed, and the device slipped in. To remove it for cleaning the process is reversed. The screen is said to prevent the passage of flame down the pipe when the motor backfires. Price $3.—F. Joswich Mfg. Co., St. Paul, Minn.

Ieco Steer Warm for Winter

For winter driving the Ieco Steer Warm grips are intended to displace cumbersome gloves which tend to lessen the firmness of control of the steering wheel. The operation is electrical, depending upon a resistance coil which consumes but a small amount of current to furnish the necessary warmth to the hands. The device consists of two leather-covered grips, one for each hand which

can be laced upon the steering wheels at any points convenient for driving. The resistance wires are arranged between two copper plates in such a way that the heat is readily led to the hand. After a certain heat is attained the Steer Warms become no hotter but maintain an even temperature. For Ford cars there is a specially-designed pair which are so made that the electric headlights can be used at the same time as the heater.

One of the advantages claimed for the Steer Warms, besides the comfort obtained, is the fact that with only a light pair of gauntlets, one is enabled to grip the wheel tightly on the coldest day, thus giving good control of the car on icy surfaces. The price for Ford cars is $5 and for other makes $7.50.—Interstate Electric Co., New Orleans, La.

Eagan Valve Spring Compressor

The Eagan valve spring compressor is designed for Fords or other small cars. It is made of sheet steel, hardened, and has forked arms, one of which is placed under the spring cup and the other as high as it will go in the convolutions of the spring. By operating the screw handle at the bottom the spring is easily compressed until the pin and cup can be removed. Price, 60 cents.—Fred. Gabriel Auto Supply Co., Brooklyn, N. Y.

A. B. Neutral Lever Lock

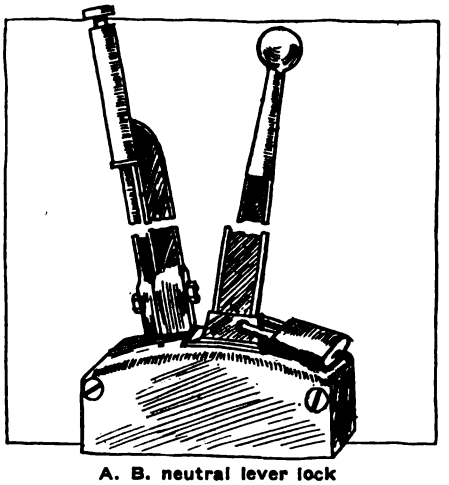
A plate with an upstanding flange which fits around the gear lever like a collar has in it two holes. A hole is drilled in the shank of the lever in line with the two holes in the collar, and all three holes are in line when the lever is in neutral. A Yale padlock, supplied with the device, is slipped through the three holes, holding the lever in neutral. This arrangement permits the car to be moved by pushing, which is not only convenient but is necessary in an emergency when there is no time to unlock the lock or when there is no key at hand. Price, $1.50.—A. & B. Specialty Co., Milwaukee, Wis.

Peerless Battery Box Black

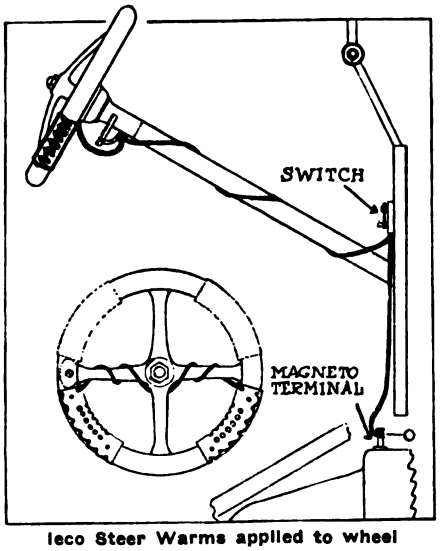
This is a solid-covering black enamel-like paint which resists the action of acid and is especially useful for battery boxes, cases and any part where the acid is likely to come in contact with the wood or metal. It saves having the wood cases replaced and the metal battery boxes from being eaten away. The maker states that this product has been tested out for over a year and that one test board coated with it was submerged for three weeks in strong acid without any effect on the finish.—Columbus Varnish Co., Columbus, Ohio.

Lyon Adjustable Bumper

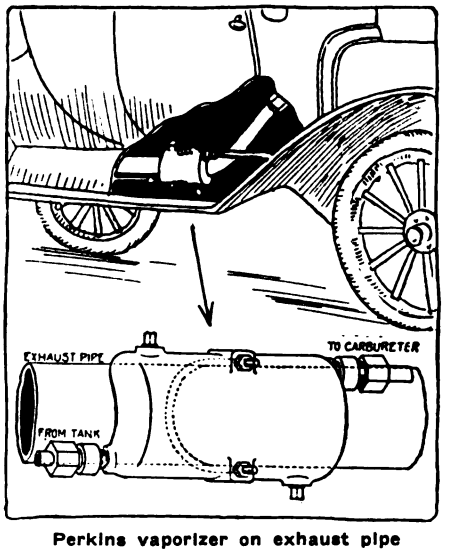
This bumper is made in two sections overlapping at the front and held together by clips, the adjustment for width being made by increasing or decreasing the amount of overlap. The amount of projection forward is regulated by moving the bumper backward or forward on the frame. The angle is also separately adjustable. Spring-tempered steel is the material used and clips and brackets are provided to fit practically all cars on the market. The Ford type sells for $6 when finished in black enamel with nickeled or brass clips and for $8 when nickel or brass plated with black clips.—Metal Stamping Co., Long Island City, N. Y.



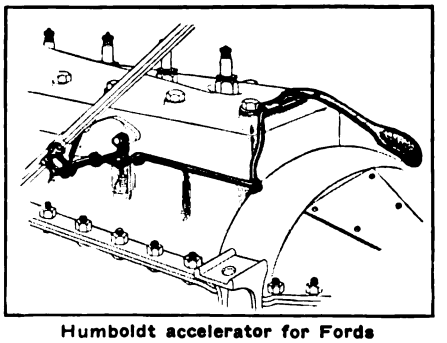
A. B. neutral lever lock



Ieco Steer Warms applied to wheel



Perkins vaporizer on exhaust pipe



Humboldt accelerator for Fords

Perkins Fuel Vaporizer

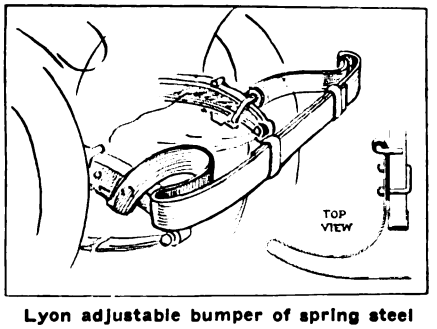
The Perkins vaporizer is a small casting with a chamber through which the gasoline passes on its way to the carbureter, the casting being clamped to the exhaust pipe and let in on the fuel line between tank and carbureter. The gasoline reaches the carbureter at a high temperature and is easily vaporized without the use of hot air. It is also filtered in passing through the casting. Solderless connections are used and the makers claim that the device, which can be installed in ½ hr., effects a considerable saving in fuel. The vaporizer sells for $3.—United States Agency, Inc., Boston, Mass.

Humboldt Accelerator for Fords

This device employs a pedal pivoted on the rear end of the Ford engine which actuates the throttle through an arm and connecting rod, permitting foot control of speed. The pedal, which is of hard rubber baked enamel finish, does not interfere in any way with the removal of the floorboards. Price, $1.—Humboldt Machine & Stamping Co., Long Island City, N. Y.

Hilton Hammock for Babies

To provide a secure resting place for baby while on automobile tours the Hilton hammock has been designed to clip to the robe rail and safely hold the little one with all the comforts of home and without the necessity of taking up some of the ordinary passenger space. The hammocks are designed to fit any make of car and are provided with sun and windshield. On the under side of the hammock are pockets for milk bottles, etc., and plenty of space is provided for articles of clothing.—Hilton Hammock Co., San Francisco, Cal.



Lyon adjustable bumper of spring steel

The FORVM

CLAIMS THAT BALL BEARINGS ARE BEST FOR TRANSMISSIONS—ARGUING THE ADVANTAGES OF CONE CLUTCHES AS COMPARED WITH DISK

Ball Bearings Lead

By J. J. Jennings,
[*New Departure Mfg. Co.*]

EDITOR THE AUTOMOBILE:—In discussing ball bearings in gearsets in your issue for Nov. 18, one of your writers made a statement with reference to ball bearings as compared with roller bearings with which we cannot agree.

In broadly judging a country-wide trend of design, we must consider cause with effect as designers have to allow practical necessity to temper their ideal. If, for instance, they aim for quietness alone in the gearbox and to attain this, use plain bearings throughout at the expense of long life and efficiency, they are risking the car reputation by losing the confidence of the car owner. If we aim at quietness alone, we might have mufflers the size of gas tanks and gears of rubber.

Plain Bearings Originally Used

Let us review the history of gearbox design as to bearings: Originally plain bearings were used at great expense of fitting and scraping in, but they absorbed too much power through friction, which also caused wear, so that when ball bearings became practical, they also became at once popular. As other noises became less, the hum of the gearbox became more pronounced. As car prices dropped, high grade bearing cost became less attractive. Then was the transmission engineer confronted by the question of how much to sacrifice efficiency and life to quietness and price.

His decision was the natural one; to reduce cost where loads were least. Hence, the loss of countershaft and pocket bearing positions by ball bearings in many moderate-priced car gearboxes, but where car quality has been maintained, the ball bearing is still in use even in the least loaded positions and since no objectionable noise would be tolerated in these higher grade cars, it is evident that the blame for being noisy was largely thrust on the ball bearing by carelessness in surrounding parts, rough gears, poor shaft alignment and resonant boxes.

We take exception, therefore, to the statement that ball bearings are losing popularity due to their noisiness or that plain bearings or roller bearings are likely to supplant them through equal efficiency, greater quietness and less cost. The ball bearing still holds important gearbox positions in the great majority of cars of any price.

Clutches and Gear Gates

By Marshall P. Slade

EDITOR THE AUTOMOBILE:—In your article on Gearsets, published Nov. 18 occurs the sentence "Where the cone clutch fails is in making a quick shift from high to intermediate, for it cannot be speeded up without a double pedal action, which very few drivers ever learn to perform."

In my experience the cone clutch is quite free from the objection mentioned, while the disk clutch makes gearshifting extremely difficult. I have three cars with cone clutches and find that gearshifting either up or down gives absolutely no trouble whatever. One of the cars has the transmission on the rear axle and therefore the clutch is directly connected to the universal joint and the propeller shaft—a very considerable weight. The other two cars have the gearbox back of the clutch, with a universal joint between. The thrust collars on all of these cars are ball bearing, so that the clutch and parts connected thereto revolve very freely. There are no clutch brakes on any of these cars.

I find that if the clutch is disengaged when the engine is running at a speed corresponding to 25 m.p.h. it continues to spin for 4 or 5 sec.—a considerable time. This is what facilitates gearshifting from high to intermediate—the shift that is the most important of all. Suppose I start up a long steep hill at a speed of 25 m.p.h. When the speed drops to 18-20 m.p.h. I throw out the clutch, pause about 1 sec., and shift into intermediate without the slightest chatter of the gears. During that pause of one second the clutch continues to spin at almost its original speed, while the car rapidly slows down. When the shift is made, therefore, the gears are running at approximately the same speed and there is not the slightest trouble in making the change.

I have also a 1916 model car fitted with a multiple-disk clutch. The gearshift on this car is most troublesome. I find that when the clutch is disengaged it stops almost instantly, due to its light weight and the friction of the thrust collar. The consequence is that with this car it is impossible to change gears quietly when going at a speed of over 12 m.p.h., without recourse to the double pedal action, which you say very few drivers ever learn to perform, and which I say it is outrageous to expect them to perform.

The cone clutch, as originally made, was troublesome to keep in smooth working order, but with cork inserts or springs to permit easy engagement this trouble has been done away with. In my opinion the engineers have been working on the wrong track in striving for lightness in a clutch. What is wanted is a clutch which will continue to spin when disengaged. Theoretically this should make shifting from first to intermediate or from intermediate to high difficult, but as a matter of fact this is not the case. It certainly is not the case with any of the old Stoddard-Dayton cars.

In these days when everything possible seems to be done to make easy the running of a car, it is a great pity that the matter of gearshifting should have taken such a decided step backwards. It does not seem possible that a complicated multiple-disk clutch can be built more cheaply than a cone clutch. Why then, with its manifest disadvantages to the driver, do so many engineers use it?

There is another subject treated in your issue of Nov. 18, namely, gear gates. It seems to me that those manufacturers who have not adopted the standard shift are very short-sighted.

The S. A. E. Program

WORKING on the basis that a vigorous 1-day meeting is better than a 3-day meeting, in which the attendance is bound to be poor at any one session owing to the impossibility for all members to visit all the periods, the winter program of the Society of Automobile Engineers should bring valuable results.

Each year sees the work of the standards committee more rapidly accepted by the manufacturer, and the interest in this phase of the work and its importance makes it desirable that a day be set apart during the winter session in which the members of the standards committee can discuss the important phases of this work. It is realized, however, that the entire membership of the society cannot intelligently discuss the highly specialized topics which are often brought to a point in standards committee work. This absence of general interest in discussing the report of a division of the standards committee is often apt to cut into the attendance, as only those who are interested in the topic will remain.

Now that the standards are accepted by mail ballot, it is not necessary to insert standards committee reports between interesting papers in order to have a quorum for voting. The result is that with the standards committee work concentrated in one day, leaving an entirely separate day for the president's address and the professional session, the attendance at the reading of these papers should be much higher, and the chances for even better discussions than heretofore are increased on account of the hoped-for attendance increase.

So far as announced at present, the program of the S. A. E. winter meeting covers a field of wide interest and is one which cannot fail to interest those directly or indirectly concerned with the manufacture of automobiles and accessories. Every promise is made for a short but highly valuable technical session, from which S. A. E. members and associates are not justified in being absent if such absence is avoidable.

Carbureter Evolution

WHILE developments of a mechanical nature have taken place in the carbureter field during the past 12 months, little if anything new, in the basic principles of operation, has been given to the public. Mechanically the carbureter makers have been exceptionally busy altering mechanical details and, in some instances, quite rearranging the components of the instruments to change them from vertical-outlet models to side-outlet ones. This has called for a rearrangement of parts, but not any alteration in basic principles.

The rapidly increasing demand for side-outlet models has resulted in still another mechanical change, namely, the more general use of the hot-air jacket in preference to the water jacket, due to the fact that the waterjacket was necessary to provide the heat needed to prevent condensation in the manifold. With the side-outlet model the manifold has disappeared, and there is no demand for the additional heat, rather the hot-air pipe seems to be entirely adequate.

The demand for more rapid acceleration has been one of the loads imposed on the carbureter designer during the year, and while it has been met by the addition of or duplication of certain parts, there has not been any alteration in first principles. The means used will unquestionably take a place in carbureter design, until more simple extensions of basic principles can perform the desired functions.

The demands of production are exhibiting themselves in the forms of simplified mechanical designs and alterations to make machining and other shop operations easier and fewer. It is creditable to the carbureter fraternity that in these days of vastly increased car production the old-line carbureter makers have been able to keep pace with production and have given instruments of such satisfaction that the car makers have not been compelled to begin manufacture in their own shops.

What is needed is a better classification of carbureter types, perhaps a standardized system of nomenclature having regard for the basic principles on which different types are built. THE AUTOMOBILE has outlined a more or less incomplete system in this issue, a work which could be continued to advantage. The Society of Automobile Engineers, with its international reputation for standardizing activities, has a field of endeavor in this work.

Baker-R. & L. and Owen Merge

New Baker-R. &. L. Co. to Build Owen Magnetic Cars —Continues Electrics

NEW YORK CITY, Dec. 13—A consolidation of the Owen Magnetic Co., this city, manufacturer of the Owen Magnetic car, and the Baker-R. & L. Co., Cleveland, Ohio, has been effected. The new concern will be known as the Baker-R. & L. Co., but the cars to be manufactured will be known as the Owen Magnetic, which will be built in two models. The Baker factory in Cleveland will be given over to the manufacture of Owen Magnetic cars. The R. & L. factory at Cleveland will be used for the manufacture of bodies for the Owen Magnetic and in addition will continue the manufacture of electric cars, which the Baker-R. & L. Co. has been producing.

Capital to Be $5,000,000

The capital of the Baker-R. & L. Co. will be increased from $2,000,000 to $5,000,000. R. M. Owen, who is president of the Owen Magnetic Co., in this city, will be vice-president and director of sales. The General Electric Co., which recently obtained a considerable interest in the Owen Magnetic or Entz patents, will have directors on the board of the Baker-R. & L. Co. because of its interests in the electric transmission used in the Owen Magnetic cars.

Anson W. Burchard, vice-president of the General Electric Co., D. C. Durland and Richard H. Swartout have been elected to the board of directors of the new company, representing the General Electric interests.

The present Owen factory in this city will be continued for development purposes as well as serving as a service department. The assets of the Owen Magnetic Co., however, have all been acquired by the Baker-R. & L. organization.

Six Cylinders 3½ by 5

It has been known for some months that the Baker-R. & L. Co. was producing a gasoline-electric car built under the Entz patents, which are the basic ones in the Owen Magnetic design. This car is a smaller one than the present Owen Magnetic which has been on the market during the past year. The smaller Owen Magnetic will use a six-cylinder motor 3½ by 5 in. bore and stroke with 126-in. wheelbase. The car is claimed to turn in a circle with a diameter of 38 ft. This new car is specially designed to meet the needs of town-car work and is well suited for inside drive types such as sedans, etc. This chassis was developed with a view to meeting the requirements of those owners at present using electric cars.

The Fort Wayne factory of the General Electric is already tooled up to take care of the manufacture of electric units for these two models of Owen Magnetic cars, as well as to manufacture units for other concerns that may be licensed under the Entz patents to manufacture magnetic cars.

Manufacturers Protest New Export Declarations and Procedure

DETROIT, MICH., Dec. 10—Under the auspices of the Board of Commerce, a meeting was held to-day, at which a large number of representatives of many concerns doing an export business were present to protest against the enforcement of the new export declarations and procedure promulgated by the Department of Commerce, and which were to go into effect Feb. 1.

Exporters here claim that the statistical information the government requires could be obtained in a much more simple way and at much less inconvenience, expense, loss of time and business, than the method suggested by the government. It was proposed, and those present approved the idea, to suggest that an advisory board be selected, all the members to be experienced in the practical conduct of export business, and that this board work in co-operation with the government in getting up regulations as to how to procure the information desired by the government.

Among those attending the meeting were: Charles Denby, Hupp Motor Car Corp.; C. F. Carew, Saxon Motor Car Corp.; James Archer, Willys-Overland Co.; H. M. Robbins, Dodge Bros.; Joseph Drake, Hupp Motor Car Corp.; M. J. Breitenbeck, Detroit Steel Products Co.; P. H. Lynahan, American Blower Co.; W. L. Hoagland, chairman of the foreign trade committee of the Detroit Board of Commerce.

Moon Six-Thirty at $1,195

ST. LOUIS, MO., Dec. 9.—The Moon Motor Car Co., this city, has announced the 1916 six-thirty at $1,195, completely equipped.

In many respects the car resembles the six-forty seven-passenger selling at $1,475. The wheelbase, however, is shorter, being 118 in. The 3¼ by 4½ Continental-Moon unit power plant is block cast, with removable cylinder heads. The tires are 33 by 4 and are demountable, with an extra rim on rear.

The new model has a tumble-home type body with convex side and embodying streamline design. Other features of the body are: Deep cowl and instrument board, wide tonneau doors, 22-in., with concealed hinges and concealed locks and 44-in. leg room.

Fisk Buys Federal Rubber Co.

Gets Control After B. C. Dowse Disposes of Interests —H. T. Dunn New Head

MILWAUKEE, WIS., Dec. 13—Rumors of long standing that the Fisk rubber interests of Chicopee Falls, Mass., were negotiating for control of the Federal Rubber Mfg. Co. of Milwaukee, were confirmed Saturday night, Dec. 11, when official announcement was made that B. C. Dowse, president and general manager of the Federal had disposed of his interests and is succeeded as executive by H. T. Dunn, Toledo, Ohio.

It is stated that the Federal company will continue as a separate and distinct organization under its present name, and the change is simply one of ownership.

The board of directors will be at once increased from five to nine members, who are: H. T. Dunn and J. E. Kepperley, Toledo; H. G. Fisk, E. H. Broadwell, G. A. Ludington and E. M. Bogardus, Springfield, Mass., and B. H. Pratt, Herbert A. Githens and Richard Ward, Milwaukee.

Officers have been elected as follows: President, H. T. Dunn; vice-president and general manager, B. H. Pratt; assistant general manager, H. A. Githens; treasurer, H. G. Fisk; secretary and assistant treasurer, Richard C. Ward; comptroller, E. M. Bogardus.

The Federal company operates a large tire and commercial rubber plant at Cudahy, and employs in excess of 2000 workmen. It was established about five years ago, shortly after the consolidation of the G. & J. factories at Indianapolis with the United States Tire Co. Messrs. Dowse, Githens and Ward were formerly associated with the G. & J. During the last eighteen months the capacity of the Cudahy works have been increased more than 50 per cent and much new construction is under way and projected for 1916.

There will be no material changes in the present organization of the Federal company, according to the announcement.

Mr. Dowse intends to maintain his residence in Milwaukee, although he is not ready to discuss his plans for the future at this time.

Schooley Kearns Truck V-P

BEAVERTOWN, PA., Dec. 10—S. W. Schooley has become associated with the Kearns Motor Truck Co., this city, in the capacity of vice-president and sales manager. He was formerly special factory representative for the Atterbury Truck Co.

Many Congressmen Protest Tax

Will Fight Bill to Tax Gasoline and Horsepower if Presented

WASHINGTON, D. C., Dec. 11—A hornet's nest has been stirred up by President Woodrow Wilson in his message to Congress advocating a tax on automobiles and gasoline. To show how some members of Congress stand on the proposition THE AUTOMOBILE correspondent has secured the following expressions of opinion from Congressional leaders:

"I believe it unjust to suggest the taxation of automobiles, thus putting a burden on a great industry now bringing millions into the country. I shall make a vigorous fight on the proposal," said Senator Townsend, of Michigan. Senator Townsend is one of the Senate leaders and wields much influence in the upper body of Congress.

Representative Steele, an Iowa Democrat, says he is absolutely opposed to the proposition of taxing automobiles and gasoline. "All our farmers own automobiles and they will never stand for such a tax," he declared.

"You can depend on it that no automobile or gasoline tax will be levied by this Congress," says Congressman Miller, a Republican representative of Minnesota.

Congressman Humphrey, a Republican of Washington, said he was against all direct taxes. "There is no necessity for such a tax except in war times. I oppose automobile and gasoline taxes," he announced.

"Count me against gasoline and automobile taxes," said Congressman Tavvener, a Democratic representative from Illinois.

Congressman Sloan, a Republican representative from Nebraska, claims that gasoline and automobile taxes would be extremely unpopular in his State. "Half our farmers own machines," he added.

The matter will not come before Congress until the new year, as Congress is about to adjourn for the holiday season.

65,000 Cars and Motor Trucks on French Battle Lines

NEW YORK CITY, Dec. 13—There are 65,000 motor vehicles, including both passenger cars and motor trucks, supplying the French Army in France, according to Charles Ryer, who returned to this country from France on the Anchor liner Cameronia.

$300,000 Company to Make Electric Steel Castings

MILWAUKEE, WIS., Dec. 11—The demand for electric steel castings from numerous industries, notably manufacturers of automobiles and trucks, has induced several large steel foundrymen of Milwaukee to install electric furnaces and the organization of a new company of considerable size. The Gerlinger Steel Casting Co. of Milwaukee has recently installed an electric furnace producing 6 tons in 24 hr., this being one of the largest installations in the Middle West. The new company is the Electric Steel Casting Co., capital stock, $300,000, organized by L. G. Smith, former manager, and F. G. Wetter, former purchasing agent of the Prime Steel Co., Milwaukee. This concern is arranging to build what will be one of the first foundries in America designed exclusively for electric furnace work. The structure will be 80 by 500 ft. in size and equipped with two 3-ton electric furnaces. It will be ready to make castings about April 15, 1916. Officers of the new company are: President, L. G. Smith; vice-president, Chauncey W. Yockey; secretary and purchasing agent, F. G. Wetter; treasurer, C. F. Taylor.

Goodyear Elects Two New Vice-Presidents

AKRON, OHIO, Dec. 10—The Goodyear Tire & Rubber Co. at its annual meeting last week elected two new vice-presidents. Secretary G. M. Stadelman, who has been sales manager throughout the Goodyear upbuilding, was made a vice-president. He continues as sales manager. P. W. Litchfield, a factory manager, was also elected a vice-president. He will continue in charge of the factory operations. The company now has three vice-presidents, C. W. Seiberling, formerly vice-president, being re-elected.

A. F. Osterloh was elected secretary, stepping into the place from that of assistant secretary. He is also assistant sales manager.

The other Goodyear officers for 1916 are: President, F. A. Seiberling; Treasurer, F. H. Adams; Assistant Secretary and Assistant Treasurer, W. E. Palmer; and Second Assistant Treasurer, H. J. Blackburn.

In his statement to the stockholders, Mr. Seiberling said that the company had made over 2,000,000 tires in the year just closed.

Canadian Goodyear Tire Co. Issues New Preferred Stock

AKRON, OHIO, Dec. 9—The Goodyear Tire & Rubber Co. of Canada has issued $850,000 7 per cent preferred stock. The price is par and accrued dividend. The proceeds of the issue will enable the Canadian company to repay advances made by the Goodyear Tire & Rubber Co. of Akron, which owns all of the common stock of the Canadian company except small amounts purchased by employees of the latter. The Akron company has invested about $1,700,000 in its Canadian subsidiary, which was formed to overcome a high restrictive tariff.

The new issue of Goodyear of Canada preferred is redeemable after Jan. 1, 1919, at 110 and accrued dividends. Net earnings have been running about four times the dividend requirements, including the stock to be sold. Net sales for the year ended Sept. 30 were $2,370,914 and net income $323,874. After all charges there was a surplus of $235,135.

Canadian Ford Capital $10,000,000

600% Stock Dividend—Seven Shares of New for One of Old

DETROIT, MICH., Dec. 14—The capital stock of the Ford Motor Co. of Canada, Ltd., was increased to-day from $1,000,000 to $10,000,000. A 600 per cent stock dividend will be distributed, stockholders receiving seven shares of the new stock for every share of old stock they hold, which will make the total outstanding capital $7,000,000.

G. M. Board Meeting First Week of Jan.

NEW YORK CITY, Dec. 10—The next meeting of the board of directors of the General Motors Co. will be held during the first week of January, and dividend action on the common stock is expected at that time. The executive committee will meet within a week.

Bucyrus Rubber Elects Directors

BUCYRUS, OHIO, Dec. 9—The annual meeting of the stockholders of the Bucyrus Rubber Co., this city, was held here recently, at which the following nine directors were elected: P. J. Carroll, Jacob Colter, W. A. Blicke, George Donnenwirth, A. B. McVay, A. G. Stoltz, H. A. Paxton, Col. C. W. Fisher and M. R. Lewis.

Fahrig Exports Bearing Metal

NEW YORK CITY, Dec. 10—The Fahrig Metal Co., this city, sole manufacturer of Fahrig anti-friction metal, a special process tin base alloy, composed of 10 per cent copper and 90 per cent tin, is shipping this metal to France for the bearings of the Lorraine de Dietrich motors. The French company has adopted this material for its regular motors as well as its aeronautical motors.

Beck, of Hayes Wheel, Promoted

JACKSON, MICH., Dec. 9—Charles L. Beck, who has been general foreman of the Hayes Wheel Co., has been appointed assistant general manager of this concern's new plant in Anderson, Ind., where from 600 to 700 men will be employed when the works will be in full operation. His successor here is Henry Flick, who is assistant manager of the local plant and has been in the wheel business for the last thirty years.

Oregon Has 23,581 Cars

PORTLAND, ORE., Dec. 11—The total count of registered automobiles in the State of Oregon for 1915 is 23,581, as compared with 16,347 for 1914.

Gasoline Continues Rise

Recent Advances Make It from 40 to 60% Higher Than Last Summer

NEW YORK CITY, Dec. 11—The Standard Oil Co. of New York yesterday advanced the price of gasoline in this city 1 cent a gal., making the tank wagon basis 20 cents a gal. It is expected that the advance of 1 cent a gallon in price of gasoline will be followed by the posting of a 1-cent advance by all Standard Oil and independent companies throughout the eastern territory. Prices were advanced 1 cent a gal. at all stations in South Carolina and Louisiana.

The Standard Oil Co. of Kentucky has advanced the price 1 cent a gal., effective Dec. 13, making tank wagon basis 18 cents.

New England prices have been advanced 1 cent by the Standard Oil Co. to 21 cents a gal. in all the states with the exception of Connecticut which remains at 20 cents. Owners in Massachusetts are wondering what the outcome will be of the higher prices asked for gasoline. Within the past six months there has been a 36 per cent increase in its cost, and since January last it has jumped more than 60 per cent. The Standard Oil Co., the Gulf Refining Co. and the Texas Co. are united in that state on the price. This will mean 25 to 26 cents a gal. to the automobile owners.

Toronto gasoline is now quoting at 25 cents. As there are over 80,000 automobiles in Canada, and each car consumes on an average 400 gal. per year, this will mean a cost to the owners of Canada of nearly $3,200,000 more annually to operate their cars.

The advance made by Texas Co. on Dec. 11 in Chicago, has been met by the Standard Oil Co. of Indiana, which has advanced its prices 1 cent, tank wagon basis. The price at Chicago is now 15½ cents.

The Atlantic Refining Co. in Philadelphia has raised its price 1 cent to 19 cents a gal., tank wagon basis.

A 2-cent rise has been made in Mississippi and a 1-cent rise in Atlanta, Ga. Tank wagon basis is now 18.5 cents in Mississippi and 21 cents in Atlanta.

Gasoline prices in Portland, Ore., are now quoting at 13½ cents, and the retail prices range from 14 to 15½ cents, according to the margin of profit demanded by the respective dealers.

Gasoline in Kansas City, tank wagon basis, has been advanced 1 cent a gallon. The Standard Oil price is now 13.8 cents and independents 14.8 cents. An advance to 20 cents a gallon this winter is predicted there.

The price of gasoline at filling stations has been advanced to 14.9 cents a gallon by both the Standard Oil Co. and independents.

The Atlantic Refining Co. has advanced the price, tank wagon basis, 1 cent to 20 cents a gallon.

The advance follows an increase of 10 cents in the price of crude oil in Oklahoma and Kansas oil fields, now selling at $1.10 per barrel.

—

Rittman Talks in Detroit on Gasoline Process

DETROIT, MICH., Dec. 11—Dr. Walter F. Rittman of the United States Bureau of Mines spoke to-night at the Board of Commerce on the subject of gasoline and explained his patented process.

The Rittman process and methods were described in detail in THE AUTOMOBILE for March 25.

Some of the reasons given by Mr. Rittman for the shortage of gasoline are as follows: The tremendous increase in sales of automobiles in this country, it being stated by the lecturer that more than the production of automobiles in American factories averages 3000 a day now. A second important reason given is that the export business in oil now averages 250,000,000 gal. a year. The third big reason for the shortage, according to Mr. Rittman, is the fact that the Cushing oil fields in Oklahoma, which a year ago produced 300,000 barrels of oil a day, or even more, are gradually drying out.

—

New Truck Company in Detroit

DETROIT, MICH., Dec. 13—A new truck concern is being formed here, and G. E. Porter, who was chief engineer of the J. C. Wilson Co., is to be one of the organizers. A plant has been secured at Howell, Mich.

—

W. McK. White with Lozier

DETROIT, MICH., Dec. 11—William McK. White, formerly with the Dayton Motor Car Co., Dayton, Ohio, has been appointed sales manager of the Lozier Motor Co.

—

McBeth Westcott Advertising Mgr.

RICHMOND, IND., Dec. 10—R. S. McBeth has been appointed advertising and publicity manager of the Westcott Motor Car Co., this city.

112,000 Cars in Bay State

One Car to 32 People—One Licensed Operator to Each 27—1742 Dealers

BOSTON, MASS., Dec. 11—The fiscal year for the Massachusetts Highway Commission closed Dec. 1, and the figures show that the automobile registration receipts ran up close to $1,250,000; that there is one car to each thirty-two people in the Bay State and one in every twenty-seven people is licensed to operate a motor car. Statistics show that there has been a 33 per cent increase in the number of machines registered; a 35 per cent gain in the number of drivers licensed and a 30 per cent addition to the amount of money turned in to the State from registrations.

There are now just about 112,000 motor vehicles registered in the Bay State. These are divided into some 90,673 passenger cars; 11,960 commercial vehicles and some 9000 cars belonging to manufacturers and dealers. A year ago the figures showed about 85,500 cars in all, including 69,010 passenger vehicles, 8236 trucks and about 7800 cars belonging to the trade. The trucks alone show a gain of about 45 per cent.

Last year there were 1518 makers and dealers licensed and this year the figures show 1742, or a jump of 224. And it must be remembered that the Highway Commission is pretty strict now as to allowing any people to assume the rôle of dealers and so get registered unless they are doing a bona fide business.

133,935 Licensed Operators

There are now 133,935 people authorized to operate cars in Massachusetts, which, based upon population, gives one out of every twenty-seven people the right to drive cars.

The biggest gain has been in the number of new licenses issued, for a year ago 26,858 original licenses were given out while the number this year has jumped to 44,656. The renewals show a gain of 21 per cent, or from 72,674 to 89,279. The fees have run up to $1,205,420.19. This is the first time that the motor receipts have reached above the $1,000,000

Massachusetts Registration Statistics Compared

	1904	1914	1915	One Year Gain
Motor vehicles	*4,889	**77,246	***102,633	25,387
Motorcycles	533	8,161	9,520	1,359
Makers and dealers	102	1,518	1,742	224
Licenses, operators and chauffeurs	6,869	26,858	44,656	17,798
Renewals, operators and chauffeurs	None	72,674	89,279	16,605
Examinations	None	7,497	10,523	3,026
Receipts	$24,490.50	$925,964.75	†$1,205,420.19	$279,455.44

*Registered. About 7000 unregistered.
**Including 8236 commercial vehicles.
***Including 11,960 commercial vehicles.
†Does not include fines which will total about $50,000.

mark. When the fines are computed and added it will make the total about $1,250,000, so the gain will be more than 30 per cent, the total receipts a year ago being $925,964.75.

4899 Cars in 1905

If one looks back a decade and notes the figures it shows a wonderful growth for in 1905 there were but 4899 cars registered with 102 dealers and manufacturers. The private operators numbered 3736 and the chauffeurs 3133. At that time the annual registration law was not in force and it was estimated that there were about 12,000 cars in the State. The yearly receipts totaled $24,490.50. Comparative figures appear in the tabulation on page 1116.

—

American Wagon to Make Farm Truck Bodies

DIXON, ILL., Dec. 9—The American Wagon Co. of Dixon will soon commence the manufacture of a convertible farm wagon body which also will be available for the chassis of a motor truck. Plans and specifications are now under discussion, and as soon as the models are produced which accord with the ideas of the company, production will commence upon an extensive scale. The decline in the demand for farm wagons forces the company to adopt the new side line.

—

Box Co. to Make Trucks

SHEBOYGAN, WIS., Dec. 11—The R. L. Frome Mfg. Co., Howard's Grove, Sheboygan County, Wis., a large producer of boxes and other packages and containers, has decided to engage in the manufacture of motor trucks. A large addition is now being made to the plant to accommodate the new truck shops. Details of the new truck will be disclosed within a short time. Experimental work has been under way for more than a year. The truck will be a light delivery type, employing worm-gear drive.

—

Beech Creek To Make Truck

BEECH CREEK, PA., Dec. 13—A new four-wheel-driven, four-wheel-steered truck is to be manufactured by the Beech Creek Truck & Auto Co., of this city, the first model of which was recently tried out here. The feature of the new truck is that both front and rear axles are pivoted to the frame at their center points by means of large ball-and-socket joints. These permit the entire axles to turn when rounding a corner, allowing the wheels to give a straight pull on the axle.

Wis. to Buy 30,000 Cars in 1916

—

80,000 Registered for 1915 and 110,000 Total Estimated for 1916

MADISON, WIS., Dec. 13—Wisconsin will absorb 30,000 cars during 1916, according to the estimate made by the office of the Secretary of State, who is in charge of registrations. The secretary plans to issue 110,000 licenses to private owners next year, based on a registration of approximately 80,000 for 1915.

Interesting statistics on Wisconsin registrations have been compiled by A. J. Cobban, registry clerk, Secretary of State's office. The figures show that during 1913, Wisconsin absorbed 10,068 new cars; in 1914, 18,514 new cars, and during the year now closing, 26,631 new cars. This goes to show that the annual gain over the previous year has been uniform, being in the neighborhood of 8000. While it would appear inconsistent to estimate a gain for 1916 of only 3400 compared with 1915, in the face of 8000 gains for three successive years, Mr. Cobban explains that the car market necessarily becomes more restricted year after year and the percentage of gain declines by the same token.

It is interesting to note that while the number of dealers who registered in 1914 was 191 less than the 1913 registry, a gain of 381 is shown for 1915.

The Secretary of State is figuring on issuing 1600 dealers' licenses next year, which is only seventeen more than the 1915 registry, but as has often been proved, the early estimates are generally far below the actual registration.

A comparative tabulation of registrations for the four years ending in December, 1915, appears herewith.

—

Car Sales Good in Manitoba

WINNIPEG, MAN., Dec. 8—Probably no figures could better indicate the state of Winnipeg's prosperity in a year of what has been termed financial depression than those in the municipal commissioner's office in the Parliament Buildings relating to automobiles. Statistics show up remarkably in comparison with former years and demonstrate that the automobile business is, if anything, busier than ever. The Province of Manitoba shows a record increase in the number of cars, for over 2000 new automobiles have been purchased during 1915 and the revenue of the Province has been increased in a corresponding proportion.

Manitoba is receiving this year upwards of $100,000 from the automobile business alone. Licenses have been granted to 9073 automobiles up to the end of September and it is anticipated that fully 500 more applications will be shown when the returns for the last 3 months of the year are tabulated at the end of December.

The straight license fee of $10 makes a total of $90,730 for the motor cars already registered. In addition licenses have been granted to 1144 chauffeurs at $5 per head, making a total of $5,720. Only 7000 licenses for automobiles were granted in the Province of Manitoba last year, showing that from April 30 up to the end of September 1915, only 6 months in all, 2073 cars have been purchased. Some most striking features have been compiled by the department with a view of showing the distribution of cars throughout the Province and also with a view to showing the number of makes of cars in use in Manitoba. The census of makes of cars operating in Manitoba during the past year numbered 174. During the present year the various numbers given the departmental census of makes of cars has been vastly increased and the increase is largely in the country where the farmers have been able to purchase cars by reason of the increased crops and prices and the general increase of prosperity.

—

1916 Tractor Tests in August at Bloomington

CHICAGO, ILL., Dec. 10—At a meeting of representatives of the leading tractor companies of the Middle West, held in Chicago, it was voted to accept the offer of Bloomington, Ill., for the tractor demonstration of 1916, to take place in August. Owing to the great expense in putting on these demonstrations, it was decided to hold but one in each State annually.

—

Velie To Add 1200-Pounder

MOLINE, ILL., Dec. 10—A 1200-lb. truck is to be added to the line of heavier Velie trucks, made by the Velie Motor Vehicle Co., Inc., this city, it will be ready sometime in the coming spring.

—

Republic Internal-Gear 5-Tonner

DETROIT, MICH., Dec. 10—A 5-ton internal-gear-driven truck is to be brought out by the Republic Motor Truck Co., Alma, Mich.

—

Iowa a New Truck

OTTUMWA, IOWA, Dec. 13—The Iowa Motor Truck Co. was recently formed in this city for the manufacture of 1- and 1½-ton trucks of the internal-gear-driven type. The truck will be known as the Iowa and will be sold in the Middle West.

Wisconsin Registration Statistics Compared

Class of License	Annual Fee	1912	1913	1914	1915
Automobiles	$5	24,578	34,646	53,160	79,791

500 at Anti-Glare Device Test

Small Bulb for Dimming Claimed Not to Meet Mass. Law.

BOSTON, MASS., Dec. 9—The Massachusetts Automobile Club last night conducted an educational test on anti-glare devices before 500 motorists for the purpose of observing whether the different non-glare devices really eliminate the glare or not. The tests were conducted with the sanction of the Massachusetts Highway Commission, which has the power of regulating these devices, but Col. Sohier, chairman of the commission, has refused to make any official statement as to whether or not any particular devices meet the requirements of the law. The tests were conducted in a closed room 140 ft. long and of width sufficient to test the devices. The floor was painted black to represent an oiled roadway and a stand was erected at one end on which the headlights were mounted at the ordinary height above the ground. At each side of the stand at an angle of 45 deg. or 10 ft. on the side and 10 ft. in front were two wax figures to represent pedestrians. Just 50 ft. in front of the light stands was a crossbar 3½ ft. high. At the extreme end of the imitation roadway stood another figure supposed to be a pedestrian. These conditions were intended to represent as nearly as possible the law requirements, in that they will not glare or dazzle 3½ ft. above the ground or 50 ft. ahead, but will clearly show up objects 150 ft. ahead and standing at either side of the road.

No Official Results

No official results were given but the sentiment seemed general among all the spectators that the present-day lights with a small bulb, that is, the dimmer arrangement, will not satisfactorily meet the requirements of the Massachusetts law.

The club intends to retain its testing place for some months so that manufacturers of other devices will have an opportunity of making tests whenever desired.

Testing the Devices

In the tests some of the non-glare devices would pick up the side objects but were not strong enough to make the objects at 150 ft. clear. In other cases the devices gave sufficient light at 150 ft., but were glaring 3½ ft. above the ground at the 50-ft. line. In several cases where the lens was frosted all over the glare was eliminated but there was not sufficient light to show objects 150 ft. distant.

Some of the dimming devices tested by the means described were:

Aderente Non-Blinding Co., Jersey City, N. J.
Opalite Deflector, New York.
Legalite Lens, Boston, Mass.
J. M. Non-Blinding Lens, New York City.
Haskins Lens, New York.
Reliable Sales Co. Lens.
Perrin No Glare.
Osgood Auto Light Deflector.
Greenwood Silvered bulb.
Lancaster Lens frosted.
Jones Lens.
Gray & Davis Frosted Bulb.
Gray & Davis frosted top and bottom with a clear surface slit horizontally.
Lancaster lens all frosted.
Lancaster half frosted from top.
Haskins lens all frosted.
Haskins open-eye lens.
Solar Eclipse lamp.

—

Rough Ozark Section of Mo. Buys Cars

KANSAS CITY, MO., Dec. 10—The Ozark section of Missouri, rough and hilly, the most backward section of the State, has started to purchase automobiles. The total for the State now is 76,257, an increase from 54,000 from the registration of a year ago.

Greene County, in the center of the Ozark section with Springfield as its county seat now boasts a registration of 1041 cars and, outside of the cities of St. Louis and Kansas City, stands fourth in the State ranking. The registration in the other Ozark counties, none of which has any cities in excess of 2000 or 3000 population is as follows:

Barry 252; Barton, 379; Camden, 37; Carter, 1; Cedar, 139; Christian, 138; Dade, 177; Dallas, 71; Douglas, 18; Hickory, 48; Howell, 145; Laclede, 94; Lawrence, 415; Oregon, 49; Ozark, 10; Polk, 177; Pulaski, 52; Shannon, 9; Stone, 46; Taney, 10; Texas, 65; Webster, 83, and Wright, 79.

Many of these counties are not touched by railroads and practically none of them have ever improved their roads. The highways through most of them follow the ridges or hollows, filled with stones and ruts. The entire district is one abounding in fish and game and is but little settled.

St. Louis leads, in the State registration with a total of 16,362 cars. Kansas City is second with 9289. The registration fees this year have amounted to $322,383, a record for Missouri.

—

New Era Capital $200,000

JOLIET, ILL., Dec. 11—The capital stock of the New Era Engineering Co. of Joliet, has been increased to $200,000. A foreign department office has been opened at 44 Whitehall Street, New York City, J. B. Crockett being placed in charge. Orders have been received for $1,500,000 worth of cars. J. P. Buckley of Detroit, has been elected vice-president and factory manager. The company was organized in April, 1915, and now has a semi-monthly payroll of $1,300.

Revival in Mexican Trade

Large Field for Trucks—Large Demand for Cars Expected

EAGLE PASS, TEX., Dec. 10—That the automobile trade with Mexico is on the eve of a big revival is shown by the movement of this class of traffic through the Eagle Pass and Laredo gateways during the last few days. During his recent visit to the border First Chief Venustiano Carranza purchased six car loads of new automobiles, and the shipment passed through here a few days ago destined to different parts of Mexico. For his personal use, and the use by his staff officers General Carranza placed orders in San Antonio for six up-to-date seven-passenger, eight-cylinder cars and three four-cylinder touring cars. The former order included seat cover equipment, bumpers and Silvertow cord tires. The cash price paid for the nine cars was $15,000.

With the return of normal business conditions in Mexico automobile dealers in all Texas border towns expect an unprecedented rush of orders for cars.

—

1,000,000 Model T Fords

DETROIT, MICH., Dec. 10—At 1:55:30 this afternoon car No. 1,000,000 of the model T Ford was completed at the Ford Motor Co. main plant. The first model T was made in 1908. Including other models, the company has made a total of approximately 1,080,000 Ford cars, which have been made and sold up to this afternoon. Ford officials estimate that 750,000 of the 1,000,000 model T cars are in operation in the United States.

Based on the average value of the model T roadster, touring car and town car of the last five years, the value of the model T cars made to date is over $668,000,000.

—

Ford Motor Co. Buys 20 Acres of Ground in Detroit

DETROIT, MICH., Dec. 10—Vice-President Frank L. Klingensmith of the Ford Motor Co. confirmed to-day the purchase by the Ford company of property aggregating about 20 acres of ground on Woodward Avenue and adjoining the big plant to the north.

Negotiations had been pending for several months and the deal is said to involve between $500,000 and $1,000,000, the exact figures not being made public. The property includes land of the Braun Lumber Co., the H. W. Harding Lumber Co., the United Fuel & Supply Co. and

the St. Francis Home of Orphan Boys.

For the present, it is said, that only provisions will be made for larger railroad switching facilities and to embellish the northern approach to the Ford plant.

With the newly acquired property the Ford company has a frontage of about 1490 ft. on Woodward Avenue, which does not include property now being used as recreation grounds.

—

Harrow Tractor Co. Organized with $300,000 Capital

DETROIT, MICH., Dec. 8—The A. T. Harrow Tractor Co. has been formed and incorporated, its capital stock being $300,000 and its officers and incorporators A. T. Harrow, president; H. M. Sweet, vice-president and E. A. Cobo, secretary-treasurer. This new concern has taken over the Michigan Tractor Co., which was recently organized by the same parties interested in the Harrow company.

The company is now endeavoring to find a factory either in Detroit or vicinity in which to start making its tractor, which was invented by Mr. Sweet, and which is to sell at $950 without the plowing outfit and at $1,100 with this accessory. The temporary headquarters of the concern are at 12 Jefferson Avenue, East.

—

To Test Michigan Law

DETROIT, MICH., Dec. 11—As there has been a good deal of controversy about the new Michigan automobile tax law, which goes into effect Jan. 1, it being claimed that the law is unconstitutional, a test case will be taken to the courts. Pending a decision, it has been announced by Secretary of Police, George Walters, that motorists may continue to use their cars with their present or 1915 license number. If they care to, they may secure the 1916 license plate and pay their tax according to the new law, and in case the latter is declared void, they will receive the difference in excess over the present taxation.

—

Another Injunction for Prest-O-Lite

LOUISVILLE, KY., Dec. 10—A preliminary injunction has been issued here in favor of the Prest-O-Lite Co., Inc., Indianapolis, Ind., in its suit against the Sun-Lite Gas Co., Thomas F. Hackett, C. A. Tucker and J. J. Moran and Margaret Moran, charging illegal refilling of Prest-O-Lite tanks. The injunction compels the refillers to destroy the identity of the Prest-O-Lite cylinder, to convert it into a properly branded Sun-Lite tank and then forbids the fraudulent substitution of such a tank upon a Prest-O-Lite user.

Thropp Patent Suit Dismissed

—

New Testimony Fails to Change Decision in Litigation vs. U. S. Tire

NEW YORK CITY, Dec. 10—The suit of the De Laski & Thropp Circular Woven Tire Co. against the United States Tire Co. was dismissed by Judge Hand this week. This case was an effort on the part of the De Laski & Thropp company to secure the upholding of its tire core patent by means of new testimony, following a decision of the Circuit Court of Appeals holding the patent invalid because anticipated.

The patent in question covers molds used in the manufacture of tires by practically the entire industry, and if upheld would give a practical monopoly to the owner which would permit the exaction of large sums.

Judge Hand agrees with the decision of the Circuit Court of Appeals that the patent was anticipated, referring to the use of tire molds by the Goodrich company, and points out that the Fisk cold press of 1903 and 1904 antedates Thropp's press, the date of invention of which the testimony sought to carry back from Feb. 1, 1905, to January, 1904. The opinion also states: "I have no hesitation in finding that the Fisk mold antedated Thropp's 1904 mold. I do not, of course, mean that the Fisk mold was itself an anticipation of the patent, but if Thropp may carry back to January, 1904, then he is met by an apparatus as near to his invention as that by which he would carry it back."

—

Lee Tire & Rubber Corp. Formed—To Increase Output

CONSHOHOCKEN, PA., Dec. 10—The formation of the Lee Tire & Rubber Corp., this city, has completed the refinancing of the Lee Tire & Rubber Co., which has provided for a large increase in its output. The new company has 100,000 shares issued of an authorized amount of 150,000 shares, no par value. This stock will be controlled and managed by the same officers that have controlled the old company. The output is to be increased from the present rate of 200,000 tires a year to at least 400,000. Of the 100,000 outstanding shares, 67,000 shares are being offered at $50 a share, and the 33,000 shares are being retained by officers and interests identified with the company. All of the property, assets, and business of the old company are taken over.

The officers selected for the new company are: President, A. A. Garthwaite; vice-president, J. J. Watson, Jr.; secretary, Samuel Wright; treasurer, H. C. Coleman.

The new board of directors of the company are as follows: S. B. Fleming, president of the International Agricultural Corp.; A. A. Carthwaite, president of the Lee Tire & Rubber Corp.; J. J. Johnson, president of Johnson & Johnson, New Brunswick, N. J.; S. H. Miller, vice-president of the Chase National Bank; G. M. P. Murphy, vice-president of the Guaranty Trust Co.; J. W. Prentiss of Hornblower & Weeks; J. J. Watson, Jr., vice-president of International Agricultural Co., and Joseph Wayne, Jr., president of Girard National Bank, Philadelphia.

The statement of earnings for the ten months ended Oct. 31, last, follows:

Net sales		$2,794,025
Cost of sales after depreciation		1,991,691
Gross profits on sales		802,334
Profit on materials sold		1,100
Total profits		803,434
Selling, administration and general expenses		364,018
Balance		439,416
Add: Discount on purchases	$14,740	
Income from properties	3,758	18,498
Balance for interest		457,914
Interest paid		45,439
Surplus		$412,475

The balance sheet of the company, with the new financing accomplished, is as follows:

Assets

Cash	$127,240
Accounts and notes received	334,436
Inventories	963,701
Total current assets	$1,435,378
Deferred debts	8,558
Plant and equipment	1,094,987
Patents, trade marks, etc.	400,300
Total	$2,939,524

Liabilities

Current liabilities	$117,758
Reserves	188,175
Stock 100,000 shares in par value	2,638,591
Total	$2,939,524

Jameson To Take Two Years' Leave of Absence

TOLEDO, OHIO, Dec. 10—For several months C. S. Jameson, vice-president and director of the Willys-Overland Co., this city, has been in ill health and has finally decided to relieve himself of all commercial responsibility and obtain a much needed rest. That he may carry out this intention he has resigned as an officer and director of the Willys-Overland Co. to take a two years' leave of absence. Mr. Jameson leaves shortly for Florida where he will spend the winter.

—

Premier Cushion Spring Co. Formed

DETROIT, MICH., Dec. 8—The Premier Cushion Spring Co. has been incorporated, its capital stock being $25,000. The incorporators and officers are William D. McCullough, president; William A. Falls, vice-president and Joseph A. Schulte, secretary-treasurer. The first two members were formerly with the Detroit Wire Spring Co. and Mr. Schulte is manager of the local Cadillac branch.

Hupp Gains 97% in November

1915 Production 50% Over 1914 to the End of That Month

DETROIT, MICH., Dec. 9—Production and sales of the Hupp Motor Car Co. during November were 97 per cent greater than in November, 1914, and show an increase of 47 per cent over the record of last October. Taking the production for the 1915 season to the end of November, the increase in production has been 50 per cent as compared with the same period of 1914. While the material market, according to the Hupp officials, is still a cause for holding back production, it is not quite as serious as it was during the summer and fall months. Complaints now coming are rather owing to slow deliveries and this is due to a shortage of railroad freight cars, thousands of which are now tied up in the East.

—

Steel Higher

NEW YORK CITY, Dec. 14—Automobile material prices were steady last week. Bessemer and open-hearth steel each went up $1 a ton to $30 and $31 respectively. These metals have seen a steady rise, the price in June last being $19. Fine up-river Para fluctuated throughout the week and closed yesterday at 71 cents. The recent rise in price of rubber, it is believed, will cause a rise in tire prices. Prices, however, in the rest of the materials that are included in the structure of tires, have made higher advances proportionately than rubber, and it is stated that these will have a greater influence on a rise in tire prices than will rubber, of which the manufacturers are well supplied with.

Gasoline in this city has risen 1 cent to 20 cents a gal. to garage men. Oil men are predicting that Pennsylvania crude oil will go to $2.50 a barrel before many months. This is of interest in connection with the prospect of a higher price of gasoline, as Pennsylvania petroleum is generally credited with carrying the highest content of gasoline. Pennsylvania crude is at present quoting at $2.10 a barrel, while that from Kansas is selling at $1.10, a rise of 10 cents taking place to-day.

The undertone in copper continued firm throughout the week. Prices remained steady at 19½ cents in both electrolytic and lake. Aluminum remained constant at 56 cents. The Virgin quality, which is 99 per cent pure is held at 58 cents. Lead was firm though lower at $5.20 per 100 lb.

—

Consolidated Car Stock Par at $10 per Share

DETROIT, MICH., Dec. 9—As reported briefly in THE AUTOMOBILE for Dec. 2, the Consolidated Car Co., this city, which makes the Abbott-Detroit, has increased its capital stock to $500,000. This stock will be sold at par, $10 a share, not through brokers, but by the members of the company. The former capitalization of the company was $200,000 and it is intended to sell $200,000 of the new stock and hold the balance of $100,000 in reserve. It is said that about $135,000 worth of the stock has been thus far subscribed for. Of the new model six-44 brought out recently, it is planned to build 2000 the first year.

—

Overland Meeting Jan. 14 to Consider Increasing Capital

TOLEDO, OHIO, Dec. 13—A special meeting of stockholders of the Willys-Overland company, will be held Jan. 14, in this city, to consider and take action upon a proposal to increase the authorized capital stock of the company to $75,000,000, consisting of $50,000,000 common and $25,000,000 new preferred stock. Action will also be taken in regard to a proposal to make this preferred stock redeemable and convertible into common stock.

Motor Stocks Soar

General Motors Common and Preferred Rise 48 and 13 Points Respectively

NEW YORK CITY, Dec. 14—Notwithstanding the sluggishness and backwardness of the rest of the market during the past week, automobile and accessory stocks as a group have continued on their upward movement. There is a certain element in Wall Street that believes the best speculative mediums of the future will be the automobile and accessory stocks. They base this theory on the large growth of the automobile industry and prospects of still greater expansion.

High Marks Made

The speculative boom at present in automobile stocks under the leadership of General Motors, saw new high marks made last week. General Motors common and preferred both rose substantially, the former 48 points and the latter 13 points. The announcement that there will be a directors' meeting next month at which action will be taken in regard to a common stock dividend seemed to have a strong effect on all the stocks. A comparison of the prices of the four leading automobile stocks, General Motors, Chevrolet, Studebaker and Willys-Overland, on Saturday with those on Monday, will show the sensational rises that have been taking place in these stocks lately: General Motors, 474 on Saturday and 558 on Monday, gain 84; Chevrolet, 125 on Saturday and 155 on Monday, gain 30; Studebaker, 150⅞ on Saturday and 173½ on Monday, gain 22⅝; and Willys-Overland, 235 on Saturday and 255 on Monday, gain 20. Incidentally, Chevrolet stock will shortly be added to the list of motor shares on the exchange. The stock was offered to the public at 85 by a banking syndicate some time ago.

A number of important gains were made in other stocks, Ajax-Grieb common rose 25 points and reached the 400 mark. Its preferred closed at 105 with a 4 point gain. Goodyear common rose 4 points and its preferred 3 points. The first and second preferred of Kelly-Springfield rose 1 and ¼ points, respectively. Packard common rose 5 points. Stewart-Warner common rose 1 point.

G. M. C. Common High

General Motors common featured the Detroit Exchange with a 57½ point rise, the stock reaching 520. Its preferred rose 11½ points, reaching 120. Packard common rose 9 points. Studebaker reached the 164 mark with a 14-point gain. In the inactive stocks there was

a 400-point gain in Canadian Ford stock, which closed at 2400.

During November 49,375 shares of stock were sold on the Detroit Stock Exchange and of this number 12,465 were Reo Motor Truck Co.'s shares and 10,566 were Reo Motor Car Co.'s shares. The price of the shares of the truck company varied from 20¾ to 25¼ and the shares of the Reo car company varied in price from 40½ to 55. The par value of these shares is 10.

The next largest sales of motor stocks was that of 1746 Maxwell common, at from 68¼ to 80½, 1295 shares of General Motors common were sold, at from 370 to 478. Other sales for the month were: 500 shares of Packard common and Studebaker preferred, 40 Packard preferred and 215 Studebaker common; 128 shares of Paige-Detroit, 35 shares of General Motors preferred; 240 shares of Chalmers common and 60 preferred; 471 shares of Continental Motor Mfg. common and 20 preferred.

Weier-Smith Truck Raises Capital

BIRMINGHAM, MICH., Dec. 6—The capital stock of the Weier-Smith Truck Co., has been increased from $30,000 to $50,000. This company, which started in business in 1914, will soon bring out a new model of its four-wheel-drive trucks, of 1½-ton capacity.

—

Michigan Fender Capital $60,000

YPSILANTI, MICH., Dec. 9—The capital stock of the Michigan Crown Fender Co. has been increased from $20,000 to $60,000.

New Premier Co. Is Organized

—

Premier Motor Car Co., with $2,500,000 Capital, to Continue Car

INDIANAPOLIS, IND., Dec. 10—Following the purchase of the Premier Motor Mfg. Co.'s plant by a syndicate as announced in THE AUTOMOBILE for Dec. 2, a new corporation is being formed which will be known as the Premier Motor Car Co. It will have a capitalization of $2,500,000 and will continue the manufacture of Premier cars. A deal has been completed by which the new company becomes the owner of the T. B. Laycock Co. plant, and all the machinery and other material at the old Premier plant will be moved to the Laycock factory. A manufacturing concern which has been occupying a part of the plant will move out to make way for the new Premier company.

The new Premier Motor Car Co. is composed of a syndicate of manufacturers and bankers from Joliet, Ill., Indianapolis and Detroit. The prime movers in the enterprise are: J. C. Flowers, of the Gerlach-Barklow Co., Joliet; E. W. Steinhart, Indianapolis; C. F. Jensen, president of the Vanguard Mfg. Co., Detroit; F. W. Woodruff, vice-president of the First National Bank and the Woodruff Trust Co., Joliet; George Woodruff, president of the First National Bank of Joliet and president of the Illinois Bankers' Assn.; T. R. Gerlach, vice-president of the Gerlach-Barklow Co., Joliet and H. L. Thompson, secretary of the Gerlach-Barklow Co., Joliet.

It is understood that other interests in Joliet, New York, Chicago and elsewhere are also interested in the enterprise. Mr. Flowers is slated for president and general manager of the new company and he, with the others named, will constitute the board of directors.

The Laycock plant consists of a main building 900 by 300 ft. with a 137 by 70-ft. three-story administration building and a modern power plant, all being located on a 43-acre tract inside the city limits overlooking Brookside park and the Indianapolis parkway. The buildings are of brick, steel and concrete and an automatic fire-sprinkling system is a feature. It is stated that 3500 men will be employed in the plant and that several large new buildings will be erected. The appraised value of the Laycock real estate, plant and equipment is approximately $1,000,000 and it is said that there will be no mortgages or debts of any kind against the company.

—

Dividends Declared

Reo Motor Car Co., quarterly, 2½ per cent on common, payable Jan. 10.

Gray & Davis, quarterly, 1¾ per cent on preferred, payable Jan. 1, to stock of Dec. 22, 1915.

J. I. Case T. M. Co., quarterly, 1¾ per cent on preferred, payable Jan. 1 to stock of Dec. 13, 1915.

Maxwell Motor Co.; 14¼ per cent on first preferred stock, payable in non-interest bearing warrants which have privilege of conversion into preferred stock at par. Warrants distributed Dec. 31 to stock of Dec. 29.

Militia To Have Cars

War Dept. in Conference with Automobile Reserve Corps Accepts Its Plans

WASHINGTON, D. C., Dec. 11—The Automobile Reserve Corps movement, promoted by *Motor Print* magazine, received recognition by the War Department to-day. The plan of organization of an Automobile Reserve Corps Company was described by Lieut. Col. Chauncey B. Baker, the army transportation expert, in a conference to which had been invited G. T. Bindbeutel, editor of *Motor Print*, and H. D. Brandyce, editor of the Automobile Blue Book. The conference was at the direction of Brig. Gen. A. L. Mills, Chief, Division of Militia Affairs.

It is said that a number of cities can now proceed with the organization of an Automobile Reserve Corps which will be acceptable to the government. The formation of a volunteer motor car company has been given thorough study by Colonel Baker, whose report, not ready for publication until approved by the general staff, covers many pages of typewritten matter.

Twenty-seven Cars per Company

The plan calls for twenty-seven cars to each company and twenty-eight drivers, one an emergency driver. These drivers are described as chauffeurs to distinguish them from wagon train drivers. A chauffeur will have the rank of sergeant. Each motor company will be under the command of a first class sergeant with the title of car master. There will be three assistant car masters, sergeants; one machinist, sergeant; one helper, private; one cook; one watchman, private; one trumpeter, private. Each company is also to have one wrecking car and five motorcycles.

In the report of the study of an Automobile Reserve Corps Company by Colonel Baker is a full statement of the duties of the chauffeur. This is so minute in its details as to specify the time when grease cups are to be turned, when brakes and tires are to be tested, when the storage battery is to be given attention—in fact, a program has been drawn up which would convert an ordinary motorist into a very cautious, well trained driver in a short time. One of the principal provisions, which is emphasized by strong language and many paragraphs of repetition, is against over-loading.

There would be one or more automobile companies to a regular army division consisting, for instance, of nine regiments of infantry, one regiment of cavalry, two regiments of field artillery, one battalion of engineers, one battalion of the signal corps and the hospital and ambulance equipment.

Accompanying an army in campaign will also be a complete field repair shop. These shops will be in charge of officers who have spent some time in the leading American automobile factories. It is understood that a great many officers are now being so trained. Just how many, Colonel Baker would not say, although he admitted that the plan would be given a fairly extensive trial.

During the conference a sergeant reported to Colonel Baker, advising that he had finished his three months' course with the White Co. in Cleveland. Colonel Baker asked him for recommendations. The sergeant said:

"The experience was very valuable. I think, however, that we should spend six months instead of three months in these factories. I was kept on a job in the White plant until I had mastered the process. Then I moved to another department. While I am completely instructed as to the construction of a car, I am sure that there would have been more benefits if I had had just twice as much time."

In the event that the Automobile Reserve Corps is not fully organized all over this nation, the government has a substitute plan for the chartering of cars and trucks from automobile factories and large concerns having many cars and trucks in service. This plan embraces the enlistment of experienced drivers. A form of contract has been drawn up, by the terms of which the lessee of the automobile or truck would receive so many dollars a day for the hire of the car and so much extra depending on mileage. These figures are in Colonel Baker's report but cannot be given out for the present. In the contract the value of the car is stipulated and the government agrees to keep the truck in first class condition and, in the event of an accident, to reimburse the lessee for the full value as agreed.

Truck Company Organization.

The organization of a truck company, already in the military regulations, is similar to the car company. There is the same number of vehicles and chauffeurs and car masters; and the same ranking, excepting that two machinists are named who are corporals. In addition, the regulations require no trumpeter but specify two oilers which, according to Colonel Baker, have been found to be unnecessary and probably will be discontinued at the next change of the regulation.

The motor companies in the Automobile Reserve Corps are principally intended for the transportation of troops. It will be left to the automobile truck companies to transport ammunition, food and supplies of clothing and incidentals.

"That is, the trucks will deliver to the wagon train, which will in every case deliver to the army on the firing line," said Colonel Baker. "Ordinarily an automobile truck should not approach closer than a one and one-half day journey what we call the line of kitchens. Occasionally when the army is on the march the trucks may come as near as a half day distant. But armies, you know, spread out over corn fields and swamps and hills and off roads, where a heavily laden truck cannot proceed with the same success as a horse-drawn wagon."

Colonel Baker said that the use of automobiles of all descriptions for the transportation of troops was proved with vehemence when the Germans were marching on Paris in 1914. He said that it was only by the use of motor cars that General Gallieni was able to dispatch troops from Paris so swiftly to certain points as to thwart the advance of the invaders. Colonel Baker said that the great value of the Automobile Reserve Corps would be in concentrating and mobilizing troops—in the event of war, moving great masses of troops to new positions over night.

Militia Lacks Transports

Brigadier General Mills, in a statement to Mr. Bindbeutel just before the conference to-day, said:

"It is encouraging to know that you have been able to get promising responses in your work, and I can assure you all possible encouragement will be extended to you by this office. Inasmuch as the transportation facilities of the organized militia are now in great part lacking, so far as divisional trains are concerned, the War Department will be very glad to see the States organize and maintain their proper components. Of course, the organization of such units is entirely a matter to be taken up by the States concerned; such organizations being part of the organized militia would participate in federal assistance just as is the case with infantry or other units."

Preparedness Meeting for Met. S. A. E.

NEW YORK CITY, Dec. 9.—The Metropolitan section of the Society of Automobile Engineers will hold its December meeting on Dec. 16 at the Automobile Club of America, where a paper will be read by Capt. Gordon Johnson, Eleventh Cavalry, U. S. A., on What the S. A. E. Can Do for the U. S. Army.

New Troy Trailer Out

TROY, OHIO, Dec. 10—A new four-wheeled trailer of 1250 lb. capacity to sell at $125, has just been brought out by the Troy Wagon Works Co., this city. This is the lighest Troy trailer made. It has a 70-in. wheelbase, standard 56-in. tread and is mounted on solid tires.

54 New Show Exhibitors

80 Car Exhibitors for N. Y. and 86 for Chicago—307 Accessory Firms

NEW YORK, Dec. 13—Six additional car exhibitors for the National Shows at New York and Chicago and forty-eight new exhibitors of accessories were allotted space during the past week, making the list of complete car makers for the New York Show eighty and for the Chicago exhibition eighty-six, while the accessory exhibitors total 307, nearly all of whom will be present at both shows. There will be seven makers of electric cars at each show.

The new car exhibitors are S. J. R. Motor Co., Boston, Mass., maker of the S. J. R. car; the Lescina Auto Co., Newark, N. J., the Lescina car; both exhibiting at the Palace. At Chicago, the Princess Motor Car Co., Detroit, Mich.; Walker Motor Vehicle Co., Chicago, and the Gadabout Co., New York City, are to be added, while the Champion Auto Co., Chicago, will exhibit the Champion car at both shows.

Society day at the New York Show is to be Wednesday, Jan. 5, but contrary to the custom of previous years, no double admission will be charged. The show will open at 2 p. m. Friday, Dec. 31, and at 10 a. m. daily thereafter. The Chicago show will open at 2 p. m. Jan. 22 and at 10 a. m. daily thereafter. The closing hour in each case is 10.30 p. m.

Exhibits for the fourth floor at the Palace may be received as early as 8 a. m. Tuesday, Dec. 28. The receiving room will be closed at noon on the opening day and at 10 a. m. on Monday, no cars, boxes or crates being permitted to enter after noon of the opening day. Shipments will be received at New York on Thursday morning and at Chicago on Friday morning preceding the opening day. At Chicago no cars will be admitted after Sunday following the opening day.

The new accessory exhibitors are as follows:

New York and Chicago

American Chauffeur Pub. Co. Cincinnati, Ohio
Champion Auto Equipment Co. Chicago, Ill.
Burd High Compression Co. Rockford, Ill.
Clear Vision Cleaner Co. New York City
Efficiency Oil Corp. St. Louis, Mo.

Three Detroit Show Buildings

DETROIT, MICH., Dec. 13—The fifteenth annual Detroit automobile show which will be held Jan. 15 to 22, will be quartered in three large buildings, forming part of the Riverside summer gardens, and located at East Jefferson Avenue and the Belle Isle bridge. They will provide about 60,000 sq. ft. of floorspace and will be decorated appropriately.

—

Fifty Exhibitors for Cleveland

CLEVELAND, OHIO, Dec. 10—All the display space at the Cleveland automobile show, to be held at the Wigmore coliseum Jan. 8 to 15, has been taken. In all there will be fifty exhibitors.

—

25 Wintons Cover 303,919.3 Miles Without Repairs

CLEVELAND, OHIO, Dec. 14—The chauffeurs of twenty-five Winton cars drove 303,919.3 miles without any expense for repairs in the eighth annual chauffeurs' contest of the Winton company. The average repair expense for the nearly 2,000,000 miles in these eight contests is 19¼ cents per 1000 miles. Thirty-five hundred dollars was awarded. Mileages were restricted to a maximum of 12,500. Twenty drivers covered this distance. A special prize to owners for a best record by a model 21-A was won by H. J. Browning of Tarrytown, N. Y., who will receive a new Winton for the one he is driving. The leaders among the winners are tabulated herewith.

—

Kelly-Springfield Tire May Move to Springfield

AKRON, OHIO, Dec. 9.—The Kelly-Springfield Tire Co. may move its Akron plant to a new one in Springfield, Ohio, according to plans of the company. Though up to the present time no suitable location has been obtained in that city the officials of the concern have been negotiating for the purchase of land there, upon which to erect new factory buildings.

—

Rumely Properties Sold

SOUTH BEND, IND., Dec. 11—The properties of the M. Rumely Co. and the Rumely Products Co., totaling $32,000,000, were sold at receiver's sale Dec. 9, at the main offices of the M. Rumely Co., in Laporte, Ind., by F. P. Mount, receiver and special master, acting under instructions from Judge A. B. Anderson of the Federal Court at Indianapolis. The purchasers were the Advance-Rumely Co. and the Advance Thresher Co.

—

S. G. V. Creditors Meeting Dec. 21

PHILADELPHIA, PA., Dec. 11—Stephen M. Meredith of Reading, Pa., has been appointed by the Berks County Court as master in the equity proceedings of the S. G. V. Co., against itself, in the distribution of the balance in the hands of R. E. Graham, receiver. Creditors are advised to meet the master in the Court House on Dec. 21.

Chicago Feature Race 300 Miles

Speedway Directors Follow Hoosier Track's Example—Prizes Reduced to $30,000

CHICAGO, ILL., Dec. 15—There will be no 500-mile race on the Chicago speedway during the season of 1916, the directors of the local track following the example of the Indianapolis promoters and reducing the distance of their feature event to 300 miles.

They also have adopted a policy of financial conservatism and conservation of gate receipts and have cut the prize money from $54,000 to $30,000. It is probable that the winner will receive $12,000 or 40 per cent of the total.

Chicago's 300-mile race will be held June 19 and the entry blanks will be sent out immediately. The entry fee will be $100 but this will be refunded provided the car reports for the elimination trials.

Amateur Race May 20

May 20 is the date decided on for the amateur drivers' race and entry blanks will be mailed as soon as the contest board of the American Automobile Association confirms the special set of rules.

A. C. A. Tests Car Heater

NEW YORK CITY, Dec. 15—The Four-in-One automobile heater made by the Continental Auto Heater Co., New York City, was tested yesterday by the technical committee of the Automobile Club of America. The heater draws gas from the exhaust pipe of the motor and the test was for the purpose of determining whether or not there was any loss of power due to the installing of the device. According to the officials of the A. C. A. there was less back pressure with the device attached than without it, showing conclusively that the application of the Four-in-One heater would cause no loss of power.

$10,000 Addition for Crow

SOUTH BEND, IND., Dec. 11.—Owing to the fast increasing demand for Crow cars, the Crow Motor Car Co., Elkhart, Ind., has found it necessary to increase the capacity of the plant and the construction of a large addition has been commenced. It is expected the addition will be completed by the first of the year and the output of the plant will have been increased to 350 finished cars a month. The new extension will be 45 by 240 ft. and cost approximately $10,000. The main part of the new building will be utilized as the body department. The arrangement will allow for the rough lumber to be unloaded from the cars at one end and be worked through to the finished body at the other. At present the plant is turning out a complete automobile almost every working hour. The December production will be 150 cars, and orders have been received which will keep the concern busy during practically the entire automobile season of 1916. The gross business of the Crow company the past year was approximately $2,000,000. With the completion of the addition it is expected to double the production of the present plant.

Non-Stop Maxwell Covers 7647.6 Miles to Dec. 7

LOS ANGELES, CAL., Dec. 7—With a total of 7647.6 miles covered since noon, Nov. 22, the Maxwell 25 which is making an attempt to establish a new world's non-motor-stop record is now on the second half of the record run.

A puncture made one tire change necessary but there has been no other stop except for oil, gas and water at the regular control where the supplies taken on have been recorded by the observer on duty and in most cases by the one to go on the next eight-hour shift.

The present non-motor-stop record is 12,404.9 miles, made in San Francisco more than 2 years ago.

American Brass Gives $35,000 Christmas Present

KENOSHA, WIS., Dec. 10—As an appreciation of the co-operation given by its 1900 employees in making 1915 the most prosperous year the concern has ever experienced, the American Brass Co., Kenosha, Wis., on Dec. 7, made a Christmas present to each employee, the whole amounting to $35,000.

Champion Plug Convention Dec. 27-30

TOLEDO, OHIO, Dec. 14—The annual convention of salesmen affiliated with the Champion Spark Plug Co., will be held in Toledo, Dec. 27, 28, 29 and 30.

The main purpose of the meeting is to bring the selling staff together so that they can go over the advertising and selling plans for the coming year. Last year the Champion company made and sold 6,000,000 spark plugs while the plans for the coming year call for a production of 12,000,000.

Overland Service Station in Boston

BOSTON, MASS., Dec. 15—The Willys-Overland Co. will erect a three-story service station in this city at Brookline Avenue and Butler Street, for Overland and Willys-Knight owners. The building, which will be 105 by 260 ft. will give 81,900 sq. ft. of floorspace.

Iowa Maxwell Dealers Meet

DES MOINES, IOWA, Dec. 10—Iowa dealers for the Maxwell Motor Co. assembled in Des Moines on Dec. 8, to discuss trade conditions and make plans for the 1916 selling campaign. The partial payment plan for selling Maxwell cars was outlined by F. L. Buckbee, factory representative from Detroit and addresses were made also by E. M. Lubeck of Chicago, district sales manager; C. R. Newby of Detroit, factory sales representative; and W. L. Giffens of the Maxwell Auto Sales Co., Chicago.

U. S. Tire Convention Opens

DETROIT, MICH., Dec. 14—About 350 members of the sales organization of the United States Tire Co. are here from all over the country to take part in the annual convention starting to-day. They will be addressed by the officers of the company on many subjects dealing with the tire business and part of the time will be spent in going through the local plant.

Chalmers Warehouse in Des Moines

DETROIT, MICH., Dec. 10—The Chalmers Motor Co. will establish a large factory warehouse in Des Moines, Iowa, to enable its Iowa dealers to be supplied quicker and at less transportation charges, of the cars they need. J. H. W. Mackle, who was Chalmers district manager for the Central States, will be in charge of the warehouse and the work of distribution. His offices are temporarily at 411 Hubbell Building. The Iowa Auto & Supply Co. remains the Chalmers distributor in Des Moines.

DES MOINES, IOWA, Dec. 10—Chalmers Day for Iowa was celebrated in Des Moines on Dec. 9, with Chalmers dealers and distributors from every section of the State to the number of over 200 in attendance. Business sessions were held during the day with a luncheon party at noon and a dinner at night.

Michigan Firestone Dealers Meet

DETROIT, MICH., Dec. 11—Firestone tire dealers from Michigan met here this week at a business convention, at which officials of the Firestone Tire & Rubber Co., Akron, Ohio, were present. At the banquet given the dealers, Secretary S. G. Corkhuss announced that owing to the great increase in business in Michigan, a new and much larger branch house will be built here. At the convention the new Firestone tire with black tread and red side walls was shown the dealers for the first time.

Continental Contract for Splitdorf

NEWARK, N. J., Dec. 10—The Splitdorf Electrical Co., this city, has secured a contract from the Continental Motor Mfg. Co., Detroit, Mich., for Dixie-40 magnetos, cables and switches. All Continental motors used for show purposes or submitted to manufacturers as samples will be Dixie equipped and so filled on orders unless working specifications call for other ignition.

Plant for Tubeless Tire—The Tubeless Tire and Rubber Co., recently organized, will establish a plant at Millersburg, Ohio.

Parts Plant for Columbus—Dore Ogden, manufacturer of automobile parts, will construct a plant at Columbus, Ind.

Mason Tire to Build—The Mason Tire and Rubber Co. is planning a factory at Akron, Ohio, the estimated cost of which is $60,000.

Faultless Rubber Adds—The Faultless Rubber Co., Ashland, Ohio, has awarded contracts for an addition to its plant, which will cost about $10,000.

Wheel Co. for Montana—The Montana Improved Wheel Co., Bozeman, Mont., will erect a plant for the manufacture of a spring wheel for automobiles.

Apple Top Co. to Build—The Apple Auto Top Co., Dayton, Ohio, has had plans prepared for a brick building, 100 by 150 ft., four stories, to take the place of its plant recently destroyed by fire.

Cleveland Automatic Machine Adds—The Cleveland Automatic Machine Co., Cleveland, Ohio, has bought from the Pontiac Improvement Co. and the Kurtzner Radiator Co. the radiator company's property at 2225 Ashland Road. The deal represents between $50,000 and $100,000.

Columbia Truck to Build—The contract for the plant of the Columbia Motor Truck & Trailer Co., Pontiac, Mich., has been let. It will be a one-story structure, 60 by 250 ft. The company, which moved here from Kalamazoo, is reported to have sufficient orders on its books to keep it running for the next six months.

Perfection Coil Spring Adds—Pending the erection next spring of a new plant, 140 by 140 ft., the Perfection Coil Spring Co., Jackson, Mich., is adding to its present factory a building 150 by 36 ft., to be used as a stock room and for plating purposes. Although this concern started in business less than two years ago it has been growing exceptionally fast and must make provisions to double its production.

Salisbury Co. Makes Improvements—The Salisbury Wheel and Mfg. Co., Jamestown, N. Y., has erected a new office building to provide room for its front axle department, moved there from Greenville, Pa. The new office building is three stories high and is 30 by 50 ft. in size. By March, 1916, it is expected that additional factory buildings, providing 30,000 sq. ft. more of floorspace, will be completed. With this increased space the production will be brought up to 150 full sets of automobile wheels and axles per 9-hr. day, an increase of 50 per cent over the present capacity of 100 sets per day. The number of employees of the company is 400.

Continental Adds Another Building—Work is progressing upon the various additions to the plant of the Continental Motor Mfg. Co., Muskegon, Mich. It has just been decided to put up another new building, one story high, 50 by 150 ft., adjacent to the new drop forge plant, to be used for storage of materials. The new drop forge plant is expected to be ready within the next two weeks, as far as the building is concerned, but the six steam drop forge hammers, weighing from 1500 to 5000 lbs. each, are not expected here from the East for about six weeks, for which 6-ft. concrete foundation bases are being put up. The new motor storage and carpenter building is ready, having been completed in fifty-one days. A 150-ft. subway, 7 to 15 ft. in height and 11 ft. wide, of concrete, will be ready in ten days. It connects the new lake front building with the office and machine building.

The Automobile Calendar

Dec. 11-18	New Castle, Pa., Show, Skating Rink on Nechannock Avenue.
Dec. 31-Jan. 8	New York City, Sixteenth Annual National Automobile Show; Grand Central Palace; National Automobile Chamber of Commerce.

Oct. 14	Chicago Track Race.

The Week in the Industry

Culver Makes Change—C. R. Culver, for many years a prominent figure with the Knox Automobile Co., is now vice-president and general manager of the Stoddard Motor Car Co., Springfield, Mass., handlers of the Pierce-Arrow line.

Cottingham Makes Ford Change—H. R. Cottingham, former sales manager of the Ford Motor Co. of Canada in Montreal, has been appointed manager of the Saskatoon branch of the same company, and has left to take up his new duties.

Causer Resigns—E. T. Causer, factory superintendent of the Mitchell-Lewis Motor Co., Racine, Wis., for the last three and one-half years, has resigned to accept the position of works manager of the R. D. Nuttall Co., Pittsburgh, Pa., gears, couplings, etc. Mr. Causer assumes his new duties at once.

—

Dealer

N. Y. Auburn Moves—F. W. Wright, Inc., general Eastern distributor for the Auburn car, has opened a new retail salesroom at 1874 Broadway, New York City.

Savage Tire in Vancouver—The Western Oil & Supply Co. has been appointed distributor for British Columbia for Savage tires, and a depot has been opened at 427 Hill Street, Vancouver, B. C.

Louisville Items—The Louisville Double Tread Tire Co. has opened an office and shop at 542 South Third Street. H. N. Cohen is president.

The Cherokee Motors Co., a new concern, has opened an office and salesroom at 305 West Walnut Street. A garage will be maintained at 712 Baxter Avenue. The company handles the Maxwell.

New Waco Wholesale Supply Co.—The Spencer-Carroll Co., Waco, Tex., will open a wholesale supply house, Feb. 1, succeeding the Stamford Motor Co., Stamford, Tex., which has operated a wholesale accessory business in connection with the Ford dealership. The latter will be dropped. J. O. Hughes, now manager of the Stamford Motor Co., will be active manager of the new company. Harry Knight, now connected with the Stamford Motor Co. as traveling salesman, will not travel for the new concern, but will have complete charge of the service end of the business. He was connected with the Electric Appliance Co., Dallas, as traveling salesman, and left it to affiliate with the Stamford Motor Co. about six months ago.

Motor Men in New Roles

Thompson Heads Mors Chain Branch—The Mors Chain Co.'s Detroit branch has opened a showroom and offices at 1003 Woodward Avenue. F. E. Thompson is the local manager.

Evans Maxwell Superintendent—J. F. Evans has been appointed superintendent of the service department maintained by the Maxwell Motor Co., at its plant on Oakland Avenue, Detroit.

Grasser Assistant Hupp Mgr.—Walter Grasser is now assistant manager of the Grasser Motor Co., Detroit and Toledo, distributor for the Hupmobile in Michigan and northwestern Ohio.

Wilson King Rep.—H. L. Wilson has been appointed factory district representative by the King Motor Car Co., his headquarters being Dallas, Tex. He was formerly connected with the King-Dort Sales Co., Detroit distributor for the King and Dort.

Two Chalmers District Mgrs.—C. L. Logan, until recently manager of the Cuyahoga Sales Co., Cleveland, Ohio, has been appointed a district manager by the Chalmers Motor Co. He will be in charge of the territory in West Virginia, Ohio and Kentucky.

H. L. Pelton has been appointed district manager of the Chalmers Motor Co. in the East, with the State of New York as his territory.

Kenyon Hupp Service Mgr.—J. L. Kenyon has been appointed service manager of the Hupp Motor Car Co., Detroit. He was formerly in the same capacity with the Cadillac Motor Car Co. M. E. Houser has succeeded J. L. Kenyon as service manager of the Cadillac company.

Falk Chalmers Rep.—J. H. Falk has become a special representative for the Chalmers Motor Co., with headquarters in Detroit.

DeWitt Makes Change—Frank DeWitt, manager of the Detroit office of the Electric Products Co., Cleveland, during the past two years, has been appointed director of sales of the American Distributing Co. of Detroit. R. C. Enos was elected vice-president and general manager of the American Distributing Co. at a recent meeting of the stockholders of the Detroit corporation.

Riley Resigns—N. S. Riley, for four years head of the Kansas City, Mo., branch of the Studebaker Corp. and president of the Kansas City Automobile Dealers' Assn., has resigned from both positions. His resignation will take effect Jan. 1. Mr. Riley will be succeeded as head of the dealers' association by W. A. Brace, president of the Hudson-Brace Motor Co., who formerly was vice-president. George A. Bond of the Bond Motor Co. becomes vice-president to succeed Mr. Brace.

Henshaw Makes Worcester Changes—The Henshaw Motor Co. of Boston, Mass., Eastern Massachusetts agent for the Dodge Brothers car, has leased the building at 256 Pleasant and 3 Newbury Streets, Worcester, Mass., to be used for stock and service purposes, the company retaining its present salesrooms at 27 Foster Street. This is the second time the company has been forced to expand in Worcester. New men have been added to the organization, among them F. W. Bailey, former secretary to the general manager at Gray & Davis factory; G. R. Green, former owner of the Commonwealth garage, who are on the sales force; J. J. Glennon, mechanical expert of the King Motor Car Co of New England, who becomes service chief, and E. W. Jacocks, an insurance official who is now chief accountant.

—

Dealer

Philadelphia Fisk Adds—The Fisk Tire & Rubber Co., 258 North Broad Street, Philadelphia, Pa., is having plans prepared for a three-story brick service building, 20 by 30 ft.

Philadelphia Packard Enlarges Territory—Manager L. J. Eastman, of the Packard Motor Car Co. of Philadelphia, announces the opening of additional tributary offices in the local territory at Wilmington, Del., Lancaster, Pa., and Williamsport, Pa. Announcement has also been made of the appointment of L. S. Jullien as territorial manager for the Pennsylvania district exclusive of Philadelphia.

Minneapolis Trade Items—The Willard Storage Battery Co., Minneapolis, Minn., has bought three lots at Harmon Place and Tenth Street and will erect a Northwestern headquarters.

Harvey E. Mack Co., representing Dodge Bros., and the B. F. Goodrich Co., is erecting a three-story building at Harmon Place and Thirteenth Street. It will remove from Hennepin Avenue. The Goodrich company will have 56 by 150 ft. and the Mack Co. 50 by 100 ft.

VOL. XXXIII NEW YORK—THURSDAY, DECEMBER 23, 1915—CHICAGO No. 26

The AUTOMOBILE

1915

A Master Moulder in Fashioning The Industry

¶ The Year in Review, Showing Those Dominating Tendencies of the Year, Those Industry-Building Forces That Are Impelling the Automobile Industry and Those Rewards That Are the Fruits of Judicious Investigation, Shrewd Planning and Bold Operation

THE year 1915 will, in the perspective of decades, be recorded as an epoch-making year in the automobile industry, a year unprecedented in the breadth of evolutionary movements as well as in the variety of them; epoch-making from a production viewpoint, with a possible output of 892,000 automobiles being manufactured in the calendar year, this including cars and trucks; epoch-making to the engineer as witnessing the introduction of the twelve-cylinder motor, confirming the engineering judgment that led to the introduction of the eight a year ago and establishing the permanency of the high-speed motor with its light-weight parts. Epoch-making in the general expanse of factory facilities and equipment in that over $15,000,000 was expended in factory additions, and added equipment, this during the year when many industries were not working at capacity, due to depression attendant on belligerent conditions in Europe; epoch-making because of the unprecedented demand at home for automobiles and motor trucks, a demand in which lies the reason for the phenomenal growth, although many would attribute it to war requirements of a mushroom nature, which unquestionably had their influence. Epoch-making because of the exceptionally large increases in capitalization of many large companies and the re-financing of them on a scale hitherto adopted by the few; epoch-making to the wage earner, due to a wider extension of profit-sharing principles, assuming the form of division of profits with employees, higher wage scales, shorter hours, and improved sanitary factory conditions; and epoch-making in that the metal markets have reached new levels, due to shortage of raw stocks, occasioned by the increased demand on the market from other industries that were directly influenced by the war.

Important Patent Decisions

AFTER having been reared in an atmosphere of patent litigation, the automobile industry, through its governing body, the National Automobile Chamber of Commerce, Inc., has made a herculean effort to do its part in solving the patent problem which has been so disturbing from the day when the Selden patent was first placed in court. To do this, the national organization adopted a cross-licensing plan by which owners of patents agreed to extend shop rights on these to other members of the association who reciprocated. Sixty-nine companies controlling over 900 patents agreed; an

action which augurs well in solving the patent problem.

Several patents have been adjudicated during the year, among these being the Conrad patent controlled by the Hess-Bright people, and referring to annular ball bearings with a continuous metal rim on which the balls between the two races bear. This patent was declared valid and the Hess-Bright company has already licensed several companies under the patent.

The electric horn patents, known as the Hutchinson patents, controlled by Lovell-McConnell, were declared invalid, the court holding not only that the claims were invalid, but that those claims covering special details were not infringed by the Sparton horn, the defendant in the suit.

A patent which was speedily adjudicated during the year was that known as the two-speed axle, owned by the Austin Automobile Co., and alleged to be infringed by the Cadillac Motor Car Co. The court held the Austin patent on a two-speed axle valid, and infringed by Cadillac. Cadillac was enjoined from making or selling new cars with that type of axle, but permitted to use, repair and sell its cars using the axle.

Another patent adjudicated was the Hanlon adjustable windshield, using a double glass, which can be placed at an angle, forming a roof to keep rain or sleet from the vertical pane. This patent alleged infringed by Rauch & Lang and the National Automobile Chamber of Commerce, was declared valid and infringed. Some manufacturers have taken out royalties and the majority of N. A. C. C. members infringing have ceased its manufacture.

An important patent, which has been in the courts for years, affecting the tire industry, was that relating to the use of metal cores in tire manufacture and known as the Thropp patent. The courts have recently ruled the patent invalid, holding that it was anticipated in that different tire concerns were using the metal mold in 1903 and 1904, thus constituting anticipations.

The Lindsay Auto Parts Co.'s patents on floating rear axle construction were declared valid. The Winton Co. was the defendant, having used this construction four years ago, but since discontinued it.

Litigation has proceeded throughout the year on the Kardo patents in the suit against Studebaker, the matter being still in the courts. Certain decisions in connection with these patents have been handed down. One patent in question referred to ball bearing steering knuckle construction, the defendant being the representative of the Chalmers Motor Co. The court held the patent was void for want of patentable novelty and invention. Another Kardo case, with respect to differential construction and brought against the Reo company, was dismissed by the court on the ground that the Kardo Co. was not lawfully organized under Ohio statutes.

An important patent adjudication was that of the Perlman patent covering a form of demountable rim which is generally in use. The Standard Welding Co. was defendant. The court decided the patent valid and infringed, and gave Perlman exclusive rights under it.

Several other patents are still in the courts, among them being the carbureter patents controlled by Stromberg.

What is known as the Motometer patent granted to Harrison H. Boyce has been declared valid, the court holding that in the patents cited as prior to the Boyce one there were no anticipations.

Exports Approximate $115,000,000

EXPORTS of automobiles, motor trucks, and parts for the calendar year, ending Dec. 31, 1915, will approximate $115,000,000 as compared with $28,000,000 for the calendar year ending Dec. 31, 1914, this representing a four-fold increase. The number of trucks exported for the first ten months of the year aggregate 20,514, which is a new high water mark. Passenger car exports reached the total of 32,965 cars. While much of the export business was due to war orders, particularly in the motor truck field, the figures have been heavily increased by the added export of parts in which are included motor truck and automobile tires, these parts totaling over $12,000,000, approximately four times what they were during the previous calendar year.

American exports have increased heavily during the first ten months through countries other than those engaged in the European war, a notable example being Australia, where for the first time the American car exports exceeded in value those from Great Britain, according to official figures of the Australian Government.

Three Controlling Factors

Three controlling factors have entered into the export business during the past year. For the first time in its history England placed an import duty of 33 1/3 per cent on cars and parts entering the United Kingdom, tires being excluded from this arrangement. This duty in contrast with Britain's free trade principles will show its effect. The duty took effect Oct. 1 and it has not been possible to judge its influence as yet. France is to-day talking of an import duty of 45 per cent which, if enforced, will practically quadruple import duties. Should France enact such a measure, it will mean a heavy revenue to these countries on post-war business, which the American manufacturer will, of course, have partially to pay.

Still a third factor is the rubber embargo by which the United States is prevented from exporting rubber goods of any nature to any European countries excepting the Allies. This arrangement was effected in February, and under it the American tire manufacturers have secured all the necessary supply of crude rubber, all of which is consigned to the British Consul General of New York for distribution. Under the terms of the embargo rubber goods cannot be exported to neutral European nations or the belligerent enemies of the Allies.

Export business with South America has not de-

veloped as anticipated, due to the enormous increase of demands at home for cars and poor shipping facilities to South America, Australia and other places. All told, 1915 cannot be considered as a healthy export year from the American manufacturers' viewpoint, this notwithstanding the fact that exports to Europe have quadrupled. This has been due much more to Europe coming and buying the goods than to Americans developing the market.

Unprecedented Factory Financing

THE closing year has witnessed more factory financing and more combinations of interests than have been experienced since the formative days of the General Motors, the United States Motors and U. S. Tire. General Electric has been the big outside organization that has become a factor, having during the past twelve months secured large interests in what were five individual concerns at the start of the year. It first secured greater interests in the Peerless and General Vehicle companies, in which it previously held interests, and merged these in the Peerless Motor and Truck Corp. Since then it has secured a considerable interest in the Entz electric transmission by purchasing an interest in the Owen Magnetic Co., building cars with this transmission, and thereby securing control of the Entz patents. Following this came a merger of the Owen Co. with Baker-R. & L. which concern will build the Owen cars, the General Electric securing its representatives on the board of directors of the manufacturing concern.

The second outstanding financial development has been the refinancing of the White Co. by New York and Philadelphia interests, increasing the capital to $16,000,000, and thus bringing new influences into the organization, which is changed in name to the White Automobile Co.

A third far-reaching financial development was the recent entry of money representing the Swift packing interests in Chicago into the Briscoe organization, which has already resulted in the concern purchasing outside factories, including that of the Lewis Spring and Axle Co. and some other plants. The outcome of this new capital and the Swift influence can be looked upon as particularly conspicuous.

A fourth large financing deal is definitely reported to be under way in Indiana in which several Hoosier automobile and parts makers are uniting, the ostensible object being to insure an adequate supply of car components, among the concerns mentioned being Cole, Auburn, Inter-State, Westcott, Peru Auto Parts and Parker Auto Parts Co.

Great Increases of Capital

In addition to these large merging and extending interests there have been many instances where outside capital has been brought into organization and capitalization doubled, all preferably for reasons of increased production. Then again other large organizations have heavily added to their capitalization to care for the natural growth. In a word, it has been a year of great financing, a fact which indicates that money came easy to the automobile companies, the enormous advertising of certain automobile war stocks and others not in the war column being largely responsible. Some of the more conspicuous increases in capital stock are as follows:

Overland has authorized the increase of common stock from $25,000,000 to $50,000,000 and has authorized the issue of $15,000,000 of 7 per cent preferred. Ford has increased from $2,000,000 to $100,000,000, only one-half of which can be issued under the Michigan laws. Chevrolet increased from $2,500,000 to $20,000,000. The capitalization of the Hupp company has been increased from $1,000,000 to $6,500,000 and the company has recently purchased a new plant for axle manufacture.

The Saxon company, an organization less than two years old, has increased from $350,000 to $6,000,000. Chandler, also a relatively new organization, has increased from $425,000 to $10,000,000, and is rapidly expanding its factory. Simplex has taken over the Crane interests, and increased its capital from $1,500,000 to $5,000,000. Franklin has increased from $900,000 to $2,000,000.

With automobile concerns increasing as these figures indicate, there must naturally be corresponding increases in some of the accessory lines, the past year being a very busy one, chiefly with the manufacturers of parts and tires. One of the leading activities has been the recent purchase of the Federal Rubber Co. by the Fisk company, the latter having added $500,000 preferred. The Federal capitalization was increased in January $1,000,000. Republic increased its preferred stock by a $3,000,000 issue, and Ajax has within the last week increased its capital from $118,500 to $5,000,000. There have been many other increases in the rubber field, including $1,000,000 added to the capital of the Hood Co.

Capital increase among the makers of component parts was led by the Continental Motor Mfg. Co., increasing from $500,000 to $2,900,000. Gray & Davis increased from $1,750,000 to $2,000,000, and the Hayes Wheel company from $300,000 to $1,000,000. Perfection Spring raised from $1,500,000 to $2,500,000.

Huge Stock and Cash Dividends

With such enormous financing propositions recorded during the year it is not surprising to read of some fabulous stock dividends as well as extra cash dividends, a few of which will suffice to show the earnings in some of the larger organizations. Ford divided $48,000,000 in stock dividends and rebated $15,000,000 to car purchasers. Chandler distributed a stock dividend of 77½ per cent, making a total of 100 per cent for the year. Haynes doubled its capital and declared 100 per cent stock dividend. General Motors paid its first dividend of 50 per cent. Continental Motor declared a stock dividend of 100 per cent; Hayes Wheel, 166 per cent; Canadian Ford Co., 600 per cent, and Fire-

stone tires 16 per cent. Republic truck 100 per cent.

Unprecedented Factory Activity

THE past year has been one of unequaled activity in the building of new factories, adding additions to existing plants and installing with machinery equipment. Approximately $15,000,000 has been spent in this work, this sum being a conservative estimate on a vote representing perhaps 70 per cent of the more active element of the industry. Car, truck, accessories and parts makers have all shared in this building activity.

Approximately 12,000,000 sq. ft. of floorspace has been added, the car makers alone adding 6,000,000 sq. ft. and truck makers 500,000 sq. ft. Tire makers, who have profited by increased protection and war orders, have added over 2,000,000 sq. ft. Some of the other accessory manufacturers who have made great increases are those building axles, gears, motors, carbureters, starters and springs.

Of the total of approximately $15,000,000 spent in buildings and equipment, over half has gone into new buildings and the remainder into new machinery. The past year has been a record one in the development of automatic machinery designed to increase production and reduce cost. This machinery has been demanded by the enormous production increases and has been made possible by the standardization of parts and the general simplification of design. Automobile manufacturers now recognize that a part must be designed for engineering requirements, but also to meet the requirements of production, and this influence has been felt more during the past year than ever before.

S. A. E. Pushes Standardization

THE Society of Automobile Engineers, the national engineering organization of the industry, has not only sustained but greatly increased the interest of the industry in its work, particularly that of standardizing vehicle parts and specifications of metals. This standardization work has been in progress for several years, but only during the past season have the manufacturers had an opportunity of appreciating the advantages of standardization. In the steel field the adoption of standard specifications for different steels has practically offset what would otherwise have been a quite considerable increase in steel prices during the past year.

Two influences have been started to assist this standardization work during the year, one being the opening of a Detroit office for the benefit of the standardization work, and the other a new mode of procedure in voting on standards by mail, a movement which has very perceptibly broadened and made more representative the balloting of different standards.

The society early in the year moved to the Engineering Building, 29 W. Thirty-ninth Street, New York City, a building occupied by allied engineering associations, and an ideal home for the society. In addition to a slightly increased membership during the year the society has grown by forming two sections, the Mid-West in Chicago and the Pennsylvania section in Philadelphia. These, added to the Metropolitan section in New York, and other sections in Detroit, Indianapolis and Cleveland, give a total of six, all of which have been active during the year. The section meetings in Detroit and Indianapolis have been particularly conspicuous by their enormously increased attendance, attributable to the subjects being very pertinent on current engineering topics, such as eight and twelve-cylinder motors, aluminum pistons, and other equally pertinent subjects. The discussions provoked have been remarkable for their interest and value.

Great Engineering Development

THE past year has been prolific in engineering development, those who believed that the automobile chassis had reached or approached the ultimate design being entirely upset. It was expected that the European war closing the doors to the engineering laboratories of the Old World would have its effect, but instead of a dearth there has been greater engineering activity displayed than ever before in the industry. This new wave began a year ago with the introduction of the eight-cylinder motor, then an experiment, but which has now taken a permanent place in the industry universally accorded it. Closely following this came the twelve-cylinder V-type motor, announced during the past year, and which has already been adopted by five concerns, and is now in the production stages. Both of these movements are distinctly American. Although both types of motors originated in Europe, yet it remained for America to develop them to the practical stage where confidence was strong enough to make them stock equipment in a single-model program.

Chassis Are Simpler

The year has been one of simplification in automobile chassis design due largely to the fact that there have been few, if any, upheavals occasioned by adding unexpected accessories, such as were precipitated three years ago when the starter movement was launched a few months before the automobile shows and completely upset production in many factories. To-day electric starting and lighting are corporate parts of the chassis and are not after-thought attachments. This was realized nearly eighteen months ago, so that to-day the engine starter and electric generator are as integral portions of the car as axles or gearbox.

The simplification of design has extended to other portions of the chassis, notably the brake connections, where there is commendable improvement. Motor simplification has resulted from the more general use of the side-outlet carbureter by which the intake manifold is eliminated, this being made possible by the increased use of vacuum-gasoline feed, permitting of placing the carbureter high on the side of the motor chassis. The more general use of block cylinder castings and designing the gearbox as a unit with the motor have aided in this work.

A conspicuous movement of the year has been the increased attention given the double sleeve valve type of motor built under Knight patents. Heretofore this type of chassis has commanded above the average figure, but for 1916 the Knight-motored chassis has been brought to the $1,000 zone and now there are three different concerns manufacturing these cars to sell between $1,000 and $1,500. The taking up of this motor for production purposes by Willys-Overland will doubtless do much to popularize it with the medium-priced car buyer.

The advent of the eight-cylinder and twelve-cylinder motors, with their necessarily small diameter cylinders, has given impetus to the development of the high-speed motor. The Cadillac eight, the pioneer V type, must be considered the first high-speed American motor, and its practical life has been largely responsible for the development of this type of motor. Higher crankshaft speeds have been largely assisted by reduced weight of pistons, and in this connection the use of aluminum alloys for this work has been definitely accepted by the engineering fraternity. No longer is the practical use of the aluminum piston questioned. Aluminum has made further progress in that it is now being used for cylinder castings as well.

State Laws Little Changed

Little new has developed in the way of State laws with the exception of the Michigan law, which requires a registration fee at the rate of 25 cents per horsepower and 25 cents per hundredweight of car. New Jersey required the carrying of mirror-scopes on commercial vehicles, a regulation which has not worked out satisfactorily, as truck vibration is too great for these devices. Maryland obtained a decision declaring that non-resident motorists must take out licenses when using the Maryland highways, the measure working particular hardship against motorists of the District of Columbia. The Illinois wheel-tax was declared illegal, but motorists agreed to continue it as the money so collected goes for road maintenance.

The year has been a particularly active one with police departments in large cities enforcing speed ordinances with rather injudicious sway. There has been too much of arresting on the letter of the law and not the spirit. New York has started imposing fines for electric dash lights which are said to violate the anti-glare ordinance.

One of the most important decisions of the year, as applying to speeding, was that in which a New York motorist was fined for speeding 30 m.p.h., a violation of the state law which specified 30 m.p.h. with reasonable safety, in the country. The motorist established the fact that he was driving with reasonable safety in the open country and on a clear road. The judge so ruled and refunded his fine which had been previously imposed. This decision is of particular importance as the clause "with reasonable safety" is incorporated in many of the state statutes and where it is not so included should be.

The National Automobile Chamber of Commerce, Inc., the controlling body of the industry, has done valiant service during the year, as already mentioned, in coping with patent litigation. Its membership is now ninety-eight, having increased fourteen since Jan. 1, a growth of approximately 16 per cent. In addition to a truck convention which it held, the chamber has been establishing service organizations in different cities, which should prove of special value to the industry.

The national organization of parts and accessory makers is known as the Motor and Accessory Manufacturers. At present it has 240 members, representing the major accessory and parts industries in the country. This association has continued its valuable credit service to its members and has extended this in some respects.

A Banner Contest Year

THERE has never been a more active year in automobile contests than 1915. It marked the entry of the specially-built speedway on a large scale, six specially constructed speedways having been constructed during the year, which, added to the three previous ones, gave a total of nine tracks. On these nine tracks was a program of events scarcely considered possible a year ago, and for which the prize money actually distributed in cash totaled $282,000. Never before has automobile racing in this country, or abroad, or any other place in the civilized world, received such reward. Over $3,000,000 in cash was expended during the year in building the chain of speedways and improving the existing ones. New York led in the expenditure, exceeding the $1,000,000 mark, followed by Chicago, Minneapolis, Omaha, Des Moines and Providence.

As a reward for these enormous investments and prize moneys, America witnessed for the first time contests won at speeds well over 100 m.p.h. and saw individual performances that came close to capturing world's speed records. The highest speed record remains in the Old World, on the Brooklands speedway, but it is expected to come to America as soon as speedy enough cars have been developed, as America has one or two speedways credited with being the fastest in the world.

During the year, manufacturers have availed themselves of these new speedways by making numerous certified trials, a movement which it is hoped will gain headway during the coming season.

Heavy Automobile Registrations

THE past summer saw the total of automobile registration exceed the 2,000,000 mark. The tables compiled from state returns by THE AUTOMOBILE showed 2,070,000 registered up to July 1. It is a conservative estimate that registrations to date approach 2,400,000. New York leads all other states in registration, having 231,713 cars registered in November. California, which held second place for several years, is now fifth, with Ohio, Illinois, and Pennsylvania leading. Iowa is in sixth place, with a total of 140,000. Approximately 10 per cent of all the cars registered in the country are registered in New York State.

S. A. E. Influence Spreads During 1915

New Sections, New Divisions and New Standards Are Features of Society's Increased Activities

FOR the Society of Automobile Engineers, the year 1915 will be a memorable one for its accomplishment along all three lines of activity—professional, standardization and social. W. H. Van DerVoort, president of the Moline Automobile Co., was elected president of the S. A. E. on Jan. 6, and under his leadership the year has been one of general progress. High spots of the past twelve months have been the adoption of fourteen new standards, the formation of new divisions for silent chains and for international co-operation, with the view of obtaining some world-wide standards, the formation of S. A. E. sections in Chicago and Philadelphia, the appointment of two members to the naval advisory board and other activities of the year, while the discussion in the general and section meetings of a wide range of useful and instructive topics must not be overlooked.

Standards Committee Work

Two activities which have received much attention from the S. A. E. during the year are the work of the standards committee and that of the various sections. The notable points in the work of the standards committee, which this year has been under the direction of K. W. Zimmerschied, of the General Motors Co., have been concerned in carrying through work which has been under advisement for a long period. Among the most important standards of the year are: the new iron and steel list, vertical carbureter flange, standard tire sizes, electric vehicle ratings and nomenclature for spring parts adopted during the January and June meetings. Considerable progress has also been made by the electric vehicle, ball and roller bearings, truck standards, chain and lock washer divisions.

The Summer Session

The summer meeting of 1915 was held on the waters of the Great Lakes, the members cruising through the 30,000 islands of Georgian Bay in the Steamship Noronic. The vessel touched at Midland, Ont., and smaller steamers carried the party through the narrow island channel to Parry Sound. The trip covered four days, from June 13 to June 17. This summer meeting was characterized by excellent attendance and was particularly noticeable for the fact that men vitally concerned with the subjects under discussion took part in the debates. The feature of the meeting was the discussion on the eight and twelve-cylinder motors.

The Detroit, Indiana and Metropolitan sections have had monthly meetings throughout the winter, spring and fall, and as a result the work of the sections has received a forward impulse which cannot fail to be of considerable value to the parent organization. The fine attendance at the Detroit meetings has been the section feature of the year. Some of the papers which have been on the program of the Detroit section during the year have been on the subject of scientific chassis design, reasons for the twelve-cylinder motor and aluminum alloy pistons. Attendance at these meetings has run up well around the 300 mark.

The Indiana section has discussed the eight- and twelve-cylinder motor also, from various angles and, in fact; has had two meetings devoted to the subject, one in February when the eight and twelve were discussed regarding their basic principles, and then again in November, when C. S. Crawford, chief engineer of the Cole company, talked on the eight-cylinder motor in answer to the arguments for the twelve presented by J. G. Vincent, vice-president of engineering of the Packard company.

Activities in the Metropolitan section during the year have embraced a complete winter, spring and fall program, and reports of research committees of the section have been particularly important. The gas-electric research committee gave a preliminary report in February and another progress report in November.

Mid-West Section Established

In October a section of the society was established in Chicago which has been named the Mid-West Section and embraces all the territory of which Chicago is the natural metropolis. The following month, in November, a section was established in Philadelphia known as the Pennsylvania Section and this will take in parts of New Jersey, Delaware, and a considerable portion of Pennsylvania.

In carrying out the business of the Standards Committee it has been found advisable to leave the final decision as to whether or not a proposal should become a standard up to as many of the society as feel themselves capable of passing on the questions. For this reason standards are now accepted by mail vote and after a standards proposal or recommendation has been passed upon at a general meeting the ballots are sent to the membership at large, thus securing the maximum number of votes.

The Winter Meeting

One of the points brought out at the summer session was regarding the advisability of having the winter meeting extend over but one day. On reconsideration of this it has been thought advisable to have the standards committee meeting on a separate day in order to leave the one day of the session open to nothing but the president's address and professional work. This plan will be attempted with a view toward increasing the attendance at the winter session, where the business of the show is very apt to cut into the available membership unless the work can be concentrated in such a manner that the S. A. E. members in New York at the time of the show will be able to arrange their business so as to be able to attend the meeting.

In May the Society of Automobile Engineers changed its headquarters from the Rubber Building, at Columbus Circle, New York City, to the Engineering Societies Building, which is devoted entirely to engineering organizations. In connection with the new building, there is a library on engineering subjects which is open to the members of the Society and also better meeting facilities than were provided in the Rubber Building, which was intended primarily for offices.

A permanent location has also been established in Detroit. This Detroit office is primarily to aid in the standards work and a recorder for the standards committee is established there to attend to the clerical work of the organization. In carrying out their duties, members of the standards committee now receive mileage allowance and in place of the semi-annual meetings, the standards committee now manages to hold a session quarterly. These meetings are held about mid-way between the two semi-annual general meetings and also in connection with the latter. During the past year the standards committee met in Detroit in April and at Chicago at the time of the founding of the Mid-West section in October.

Membership Total Now 1783

In point of membership the society is again being favored by an upward trend. During 1914 there was a revision of the membership list which resulted in fewer names being upon the list. January 1, 1915, there were 1746 members of the S. A. E. On December 20, 1915, there were 1783. The membership of the sections is also increasing and the rule which permits of section associates who are not members of the parent body, has been taken advantage of by some of the sections, thus establishing a wider circle than the total figure would indicate.

1915—A Record Year for Speedways

Six New Speedways Opened—Races Won at Over 100 M. P. H.—Many Certified Trials—Few Accidents—End of Long Races

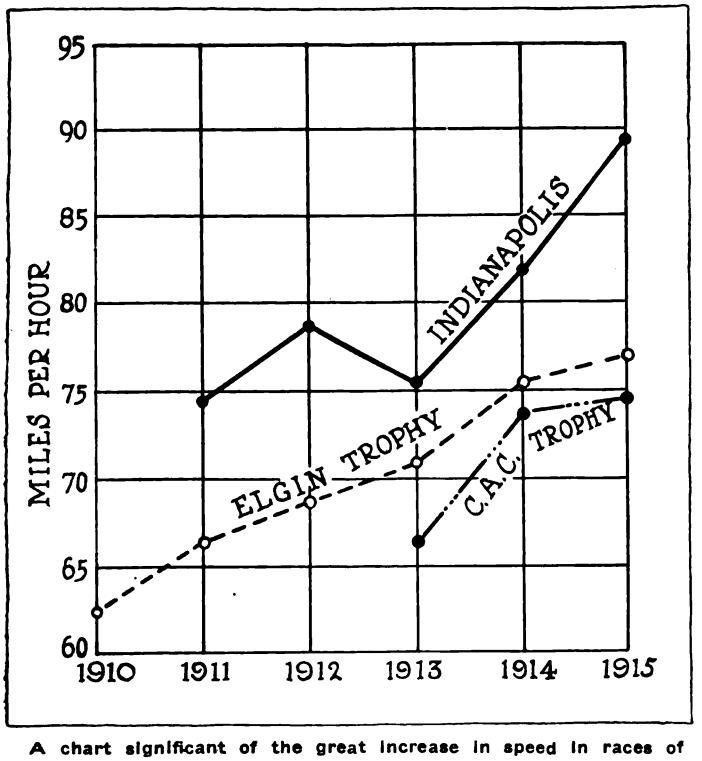
THE year 1915 has been epoch making in automobile contests largely due to the opening of three new motor speedways, in New York City, Chicago, and Minneapolis, all three with scientifically banked tracks making speeds of 100 m.p.h. not only possible in long-distance races but making it possible to establish world record marks in America as soon as faster cars can be made. Indianapolis has been relegated into about seventh place as a speed track, the new speed order being New York, Chicago, Minneapolis, Tacoma, Omaha, Des Moines, Indianapolis and Sioux City.

Nineteen hundred and fifteen has witnessed the passing of the 500-mile race and also the $50,000 purse, and for 1916 the 300-mile event for $30,000 will be the highwater mark.

The 1915 season was the greatest duel between American and European cars the world ever witnessed, Stutz and Duesenberg valiantly upholding America against superior numbers of Peugeot cars supported by Delages, Mercedes and Sunbeams. Although Resta, with the Peugeot, was perhaps the most spectacular figure in road and speedway events the palm of victory in both went to Stutz with its new valve-in-the-head design of racing motor.

For the first time in history the world has seen a race of 350 miles won at over 100 m.p.h. and on three different occasions has seen 100-mile events won at well over that figure, the fastest being 105.30 m.p.h., as against 82.47 in 1914.

An innovation were the 100-mile invitation races, one in Chicago and one in New York. Both events were won by Resta in a Peugeot in record time. The first event was made in 58:42.2 or 101.86 m.p.h., while the second event's time was 56:55.71 or 105.39 m.p.h., just 26 sec. behind the world's record created at the Brooklands track.



A chart significant of the great increase in speed in races of the past year. This is a comparison of the only three big events run over the same course and for the same distance each year, giving a fair basis of comparison

In the fourteen speedway events, the average speed of each winner was raised from 76.48 m.p.h. in 1914 to 87.23 m.p.h., and the average of each car that finished from 72.57 m.p.h. to 81.32 m.p.h.

Officially, only five new records were made in 1915, namely those made by Burman in a Peugeot on the 1-mile circular dirt track at Bakersfield, Cal., Jan. 3, for 10, 15, 20, 25 and 50 miles. New speedway marks were made from ½ to 500 miles. The Brooklands records of 200, 300, 400, and 500 miles were also broken, the new times being respectively, 1:56:21.40, 2:55:32.23, 4:04:49, and 5:07:26.

One dominating conclusion from the 1915 racing results is that one reason for the increased speed was the correct banking on the new board speedways. Then again the use of aluminum pistons, bigger valves and better steel, and fewer tire troubles, contributed greatly toward the attainment of new speed records.

The Drivers' Share

The drivers in 1915 were offered in the fourteen speedway events purse money totaling $282,000. Ten drivers, out of a field of fifty-six competing, divided $217,900. Resta earned $37,750; Anderson, $37,000; Cooper, $31,750; De Palma, $24,600, and Rickenbacher, $24,000. The rest of the drivers mentioned received purses ranging from $19,000 down to $10,000. The remaining $52,800 was split between twenty-five drivers.

Though the number of sanctioned contests in 1915 was smaller than in 1914, there being ninety-eight as against 120 granted by the Contest Board of the A. A. A., more class races were seen than in former years. Twenty-three major caliber events were held as against seventeen in 1914. There was a falling off in dirt track events, which numbered only fifty-nine as against eighty-eight in 1914. Certified trials and fuel economy tests were fewer with only six as against twelve in 1914. The number of road races was twelve as against ten in 1914. Four hillclimbs were held, at Uniontown, Newport, Ind., Utica, and Spokane, as against two in 1914 at Uniontown and Atlanta.

Road Racing Gains in West

Road racing in 1915 was especially prominent in the Middle West and on the Pacific Coast where several important 300-mile events were held. Most of the road racing in the early part of 1915 was on the Western Coast where such events as the 305-mile Point Loma race was held Jan. 9, the winner being Cooper in a Stutz who averaged 65.05 m.p.h. The Grand Prize race, a 400-mile event held at the Panama-Pacific Exposition, was won by Resta in a Peugeot at 57.5 m.p.h. The 300-mile Vanderbilt, held on the Exposition course, was also won by Resta at 67.2 m.p.h. The closing of the road racing season on the Coast was the 300-mile Venice, Cal., event won by Oldfield in a Maxwell at 68.8 m.p.h.

High Marks at Elgin

New records were established for the 301-mile Elgin and C. A. C. trophy road races. The Elgin Aug. 21 race was won

(*Continued on page* 1138)

Industry Adds 11,142,508 Sq. Ft. in 1915

Partial Returns Show Large Expansion in All Branches of Manufacture—Additions and New Equipment Represent $13,060,345

DURING the year 1915, companies actively engaged in the various branches of the automobile industry increased the capacity of their manufacturing plants by the addition 11,142,508 sq. ft., at a cost of approximately $10,000,000 to $15,000,000 and added new machine equipment, etc., representing $500,000 to $10,000,000 these estimates being very conservative. The returns received by THE AUTOMOBILE in response to letters inquiring as to the factory enlargements made throughout the industry, while by no means complete, show a total increase in area of 11,142,508 sq. ft. for the year in all branches of the industry, the cost of additions, also frequently not available, being $8,251,755. New equipment worth $4,770,590 was purchased during the past twelve months, making the total expenditure for greater factory facilities by those companies of the automobile and allied industries given in the accompanying tabulation $12,886,345.

To give an idea of the tremendous extent of this expansion throughout the industry, using the incomplete statistics available as a basis, if the total floorspace added in the past year represented but one huge single-story structure 100 ft. wide instead of hundreds of buildings, it would be 20.9 miles long. As an illustration of the magnitude of the sum expended for a part of this great manufacturing area, if this amount,—$8,251,755,—were in silver dollars piled one on top of another, the column would be 16 miles high. Also, since the amount expended for new machine equipment in the past twelve months is given as $4,770,590, this amount, if added to the other pile would make its height well over 26 miles. If the total amount expended were in silver dollars placed end to end it would cover 3710 miles, or several hundred miles farther than from New York to San Francisco.

Of the total additions, the passenger car and truck manufacturers are responsible for 6,144,044 sq. ft., costing about $4,496,650 and for new equipment worth $1,413,600, the total spent of which records are available being $5,892,250. Car makers added 5,645,840 sq. ft., at an outlay of $4,299,350 and new fittings worth $1,360,100, the total expense being $5,659,450.

Tire makers made big increases of space, the total being 2,053,160. Increase of equipment by gear makers cost $1,140,000, and correspondingly large amounts were expended in other branches of the industry.

Car Plants Add 11,142,508 Sq. Ft.

Of sixty-one companies manufacturing passenger cars and representing the leading producers, thirty-one have made additions to their factories, ranging from 15,000 to nearly 2,000,000 sq. ft., and five have occupied or arranged to move into entirely new factories during the past year. The cost of these additions averages from $4,500 to almost $2,000,000.

Nearly all these concerns have expended considerable sums for increased factory equipment, varying between $1,500 and nearly $700,000. Four of the largest companies which are working on broad schemes of factory expansion, the plans for which have already been announced. To give an idea of some of the building activity which has characterized the past twelve months in the automobile manufacturing field, we may cite some of the leading firms that have made extensive additions.

Willys-Overland has added 1,765,840 sq. ft. and has announced plans for increasing its working force by the addition of 10,000 men in the near future. Packard has carried out its plan of quantity production and concentration on the new twin-six, increasing its available manufacturing space 742,000 sq. ft., at a cost of $706,350. Reo has added 435,600 ft. and Dodge 416,000, including a new office building. This has been a big year for Franklin, three new buildings having been constructed containing 275,000 sq. ft. costing approximately $500,000. Hudson additions of 201,600 sq. ft. cost approximately $1,000,000 and the company has expended $500,000 for new equipment.

Metz has had a good year, expansion of its factory to the extent of 160,000 sq. ft. being required, the cost of the facilities thus provided being about $300,000. Briscoe added 150,000 sq. ft. to its plant and in addition has purchased the plant of the Lewis Spring & Axle Co., as well as securing still greater facilities by merging the Argo concern and the Jackson Motor Parts Co. The Lewis Spring & Axle Co. has secured the plant formerly occupied by the Flanders interest at Chelsea, Mich. Haynes secured increased space to the extent of 150,000 sq. ft. at a cost of $90,000, new equipment totalling $150,000 for the year.

Studebaker added over 150,000 sq. ft. and plans for expansion are under way requiring the outlay of approximately $1,000,000.

Maxwell increased its plant by 45,000 sq. ft., the additional space being secured at a cost of $55,000, but the company has spent no less than $373,000 on new equipment. Marmon expanded its factory to the extent of 37,500 sq. ft., the new equipment totalling $35,000.

Of the companies occupying new factories or arranging to do so during the past year, the most recent is the new Premier organization which has purchased the Laycock plant in Indianapolis, valued at $1,000,000; this comprising a main building 300 by 900 ft., a three-story structure 70 by 137 and a modern power plant. Empire's new factory gives the company 140,000 ft. of manufacturing space.

The adoption and development of the assembly plant system, which has been used to great advantage by Ford has been more marked during the past year than ever before. Ford has planned an assembly plant for Oklahoma City to contain 180,000 sq. ft. and to cost $500,000, and another for Washington, D. C. to contain 137,790 sq. ft. and to cost $400,000. The company has also bought an 80-acre tract of land near Newark and is said to be planning the construction of a large Eastern plant. Another land purchase by Ford was in Detroit, the object being reported as either the enlargement or the embellishment of the main factory. Two other companies who are building assembly plants are Chevrolet and Overland. Some of the cities chosen as sites by one or the other of these companies being New York, St. Louis, St. Paul, Kansas City and Dallas.

Truck Makers Add 498,204 Sq. Ft.

Thirteen representative truck manufacturing concerns have made additions to their factories during the year and twelve have made extensive purchases of new equipment. Three have occupied or are building new factories. Reo leads in expansion, having added 166,750 sq. ft. and Republic has increased its facilities by 92,300 ft. at an outlay of $50,000, and has also expended $10,000 on new equipment. Harwood-

Automobile Chronology for 1915

Industrial—Financial—Registrations—Miscellaneous

Industrial

January

1—Dort Co., Flint, Mich. incorporates for $500,000.
2—Pratt & Whitney buys Pope main works in Hartford, Conn., for $300,000.
6—Consolidated Car Co. buys Abbott for $500,000.
7—Used car reports of Chicago Automobile Trade Assn. nationalized.
11—Stevens-Duryea stops manufacturing. Plant taken over by Westinghouse.
11—Packard announces six worm-drive trucks.
12—Goodyear to take over Motz tire sales Feb. 1.
13—Ross & Young Machine Co., Detroit, to make eight-cylinder Ross car.
18—Willys sells Gramm and Garford interests.

February

1—Tire makers cut tire prices about 25 per cent.
3—Briscoe leases Cutting factory.
15—American Steel Foundries, Chicago, enter automobile field.
22—King gives employees 7½ per cent salary bonus.
23—Detroit Starter Co. builds Ward Leonard system starter.
26—Delion Tire & Rubber Co. opens Trenton plant.
27—Gasoline down to 10½ cents in Milwaukee.

March

4—Marion Motor Car Co. moves to Jackson, Mich.
6—Timken-Detroit Axle Co. buys Metal Product plant in Detroit.
10—Garford Motor Truck Co., Lima, Ohio, starts work.
13—Massnick-Phipps, Perkins motor maker, gets Wahl Motor Co. plant in Detroit.
19—Champion Spark Plug inaugurates profit-sharing plan.
22—Chevrolet buys second Tarrytown plant.
25—New Ford four-story assembly plant in Indianapolis.
29—Houk company buys American Spoke Co. plant in Detroit.

April

2—Ford buys 56.7 acres of land opposite Highland Park plant.
5—National Gauge & Equipment replaces Hans Motor Equipment Co.
22—Standard Steel Car Co., Butler, Pa., to build eight-cylinder cars.
26—Master Carbureter buys Air Compressor plant in Detroit.

May

1—Somerville Special Agency, Detroit, to make starter. First starters for Ford cars.
3—Kelly-Springfield Tire to share profits over $1,000,000.
6—Speedwell plant sold for $150,000 at receivers' sale to W. M. Pattison Supply Co. Assets sold to Puritan Machine Co.
13—Stevens-Duryea plants purchased by Westinghouse for $1,000,000.
14—Columbus Buggy assets sold—to supply parts.
15—J. W. Lyons disposes of Lyons-Atlas interests.
17—Monarch Motor Car Co. reorganized.
20—Leece-Neville buys a two- and three-story plant in Cleveland.
25—Lozier's Plattsburg plant sold for $200,000.

June

1—Ford reduces prices on parts from 10 to 25 per cent.
1—S. G. V. plant in Reading, Pa., sold for $55,600. Parts moved to Newark, N. J.
1—Winton changes name to Winton Co.
4—Colby plant in Mason City, Iowa, sold for $32,800 at receiver's sale.
4—U. S. L. reorganizes. United States Light & Heat Co. of New York formed with $8,000,000 capital.
5—Prest-O-Lite buys Pumpelly battery plant and enters electric lighting and battery field.
7—Baker and Rauch & Lang unite as Baker R. & L. Co. Capital increased from $1,000,000 to $2,500,000.
9—Torbenson Gear Co., Newark, N. J., buys Cleveland plant.
11—Fisher Body buys Universal truck plant for $120,000.
12—P. R. Mfg. Co., Detroit, buys Zephyr carbureter rights.
16—White gives 8-hr. day to 3800 men. Wages increased.
19—Bell Motor Car Co., York, Pa., plant starts production.
19—Knox Motors Associates formed to take care of sales and advertising of Knox products.
25—Overland raises wages 5 per cent.
28—Keeton plant sold for $45,000.

July

2—Tires may be shipped by parcels post.
3—Gasoline prices in Southwest unsettled. Costs 11 to 20 cents a gal. in Western Texas.
6—Michigan Buggy plant sold to States Motor Car Co., Toledo, for $60,000.
6—Studebaker insures employees.
7—Elgin National Watch to make Van speedometer.
7—Simplex takes over Crane Co. Will build Crane-Simplex 6 and 4.
10—Sternberg Truck changes name to Sterling.
12—Eight new Ford branches established, totaling forty-three with twenty-six assembling plants.
17—Briggs-Detroiter to continue. Detroiter Motor Car Co. formed.
17—Marion and Imperial to be marketed by Mutual Motors Co., Jackson, Mich.
19—National Rubber to move plant from Pottstown to Williamsburg, Pa.
19—Prest-O-Lite to make steel parts.
21—Pope's Westfield plant sold for $725,000.
28—Ford reduces car price $50.
31—Locomobile will share profits with workmen.
31—Autocar men given 10 per cent increase in wages.

August

2—Denby buys Briggs plant for $63,500.
2—International Motors raises wages 20 per cent.
6—Chevrolet takes over Mason stock. Twenty more acres added to Mason plant.
7—Vacuum Oil raises wages about 10 per cent.
11—Lyons-Atlas discontinues cars.
14—Hercules Motor Car Co. plant bid in for $20,800 at sheriff's sale.
16—100 Chalmers service men in annual convention at factory.
17—New Process Gear buys Monarch Typewriter plant.
21—Case has pension system.
30—Heinze Co. enters starter field with plant in Springfield, Ohio.
31—Walker Co. to sell electrics without batteries.

September

1—Hurlburt leases Mott Iron Works in New York City.
6—Miller Rubber starts free tire service.
8—15,141 carloads of automobiles shipped in August, against 8352 in 1914.
8—New York gasoline reaches 20 cents a gal., an advance of 4 cents in 4 weeks.
9—Packard grants bonus to employees in military system.
14—Prest-O-Lite buys Brown battery. Also purchases four special Maxwell racing cars.
20—Studebaker school for employees. Three-year commercial, mechanical and technical course with savings.

October

1—Champion Spark Plug Co. increases production from 35,000 to 50,000 spark plugs a day.
1—Chevrolet Motor Co. of Delaware formed, with capital of $20,000,000; 200,000 cars for 1917.
2—Canadian car sales gain 50 per cent; 7000 more cars sold than during 1914.
2—Post office contracts awarded for trucks. Ford, G. M. C., Buick, Kelly-Springfield, White and Packard get orders.
7—England imposes a 33⅓ per cent duty on cars and parts.
9—Norma Bearings now made in America.
11—1,006,835 Ford cars built up to Oct. 1.
12—Delco 1915 output will be 125,000 systems.
15—Stearns gives 10-hr. pay for 8-hr. work.
16—Goodrich to insure and pension employees.

November

1—Chevrolet cars to be assembled in McLaughlin carriage plant in Oshawa, Canada.
1—New York State automobile and accessory plants have 15,485 employees, twenty-six automobile and parts makers. Wages increased 10 per cent in September.
1—$1,000,000 building for Touraine Motor Co., Philadelphia. Company will lease six-story building.
3—Moline Plow Co., Moline, Ill., will continue making buggies as well as automobiles.
3—Peerless and General Vehicle companies sold. Peerless Truck & Motor Corp. formed to take over both.
4—De Tamble Motors plant equipment sold for taxes. Plant idle for 2 or 3 years.
5—October shipments consist of 15,972 carloads against 10,443 in 1914.
6—Acceptance Corp., New York City, will buy notes taken by truck dealers.
6—Mercer machinists receive 50-hr. week in place of 54-hr.
6—Argo Motor Co., Jackson, Mich., buys Standard Electric plant, which it has been occupying.
8—Guaranty Securities Co., Toledo, formed to finance time payments on Overland cars. Three kinds of discount facilities—special plan for farmers.
10—Walker-Weiss Axle Co., Flint, buys H. J. Martin forging plant in Indianapolis.
11—Yale & Towne Co., Stamford, Conn., increases wages 10 per cent.
12—Studebaker to build branches in Portland and Dallas.
15—Sun Motor Car Co., Buffalo, buys Sterling Motor plant in Elkhart, Ind.
15—Touraine Co., Philadelphia changes name to Vim Motor Truck Co. to make Vim delivery car.
16—Disco Electric Starter Corp. takes over company. New capital $250,000.
19—Chevrolet assembly plant for Dallas to cost $250,000.
20—Ford tractor to be made by Henry Ford & Son, Dearborn, Mich.
20—Parry Mfg. Co., Indianapolis, to build commercial bodies, tops and trailers.
20—Springfield Body Co. takes over business of Springfield Metal Body Co. Capital is $1,000,000. To operate plant in Detroit as well as in Springfield.
22—Hupp Motor Car Co. buys American gear plant in Jackson to use for making axles.
22—Sun Motor Car Co., Buffalo, moves to Elkhart, Ind., to plant formerly occupied by Sterling Motor Car Co.
23—Lavine Gear Co., Racine, is new name of Lavigne Co., reorganized and capacity to be doubled.
23—Standard Woven Fabric Co., Framingham, Mass., Multibestos maker buys former Walpole tire plant.
24—Hupp Motor Car Corp. chartered in Virginia with capital of $8,000,000.
25—Anderson Rolled-Gear plant taken over by Shaw-Kendall Engineering Co., Toledo, to make gears.
25—New Billings & Spencer Co. formed in Hartford.
26—Canadian Ford melon, 600 per cent dividend—capital increased from $1,000,000 to $10,000,000.
26—Ford plans Eastern plant. Buys 80-acre tract near Newark—begins work on three more Ford assembly plants in Milwaukee, Omaha and Oklahoma City.
26—Fostoria Light Car Co. takes over Storm Buggy Co.
30—General Electric buys interest in Owen Co. Entz Motor Patents Corp. is formed to control Entz electric patents.
30—Premier plant sold to syndicate for $125,000. To continue manufacture of Premier cars.
30—Two land deals in Cleveland. Baker R. & L. Co. to build new plant. Rollin White plans a tractor plant in Euclid.
30—U. S. Government proposes to raise a part of its extra revenue of $112,000,000 by placing tax of 1 cent a gal. on gasoline used, and also a tax on motor vehicles, according to horsepower.

December

1—Grinnell Electric Car Co., Detroit, discontinues manufacture of Grinnell electric.
2—Reliance Engineering Co., Lansing, takes over Seager Engine Works. Machinery of Reliance company moved to Seager plant, whose assets are estimated at $1,500,000.
3—Standard Truck Co. enters small truck field with 2-tonner selling at $2,000.
4—Niles Car & Mfg. Co., Niles, Ohio, manufacturer of interurban cars, will build trucks. Will turn out general delivery type.
4—Sparks-Withington buys Cleveland Radiator Co. plant, equipment and commercial good will. Equipment will be moved to old Sparks-Withington plant in Jackson where the manufacture of honeycomb radiators will be started.
4—Burd High Compression Ring Co., Rockford, Ill., moved into its new plant, capable of turning out 25,000 piston rings per day and employing 250 men.
4—Western Tire & Rubber Co., Kansas City, moves to Akron, where it is incorporated under name of General Tire & Rubber Co. with capital of $200,000.
7—Packard to build 12,000 cars in 1916, an increase of 4500 or 60 per cent over 1915.
7—Moline Plow Co., Columbus, buys manufacturing rights of Universal Cultiplow, produced by the Universal Tractor Mfg. Co., which discontinues.
8—Puritan Machine buys Cartercar parts business.
8—Briscoe and Argo buy Jackson Motor Parts Co. Machinery which was in plant formerly occupied by defunct Mason Motor Co., also has been bought and is now in Jackson plant.

Financial

January

1—Reo profits in 1914, $2,539,187. Built 13,516 cars.
5—Hood Rubber common increased $1,000,000.
9—Hudson sales for 5 months, $7,500,000.
23—Federal Rubber capital increased $1,000,000.
29—Republic Rubber approves $3,000,000 issue on preferred.
29—Goodrich 1914 profits $5,440,000.
29—Fisk 1914 profits $942,204.

February

2—Rolls-Royce profits $384,255, decrease of $71,500.
6—Gray & Davis 1914 sales amount to $4,000,000.
9—Republic truck dividend of 100 per cent.
9—Kelly-Springfield tire profits $1,215,143, gain of $939,194.
12—Fisk adds $500,000 preferred.
15—National Carbon's 1914 income $2,215,880.
23—Stewart-Warner earns 10 per cent on common.
24—Goodrich 1914 net sales $41,764,008.
25—Studebaker profits $4,441,966, a gain of 150.6 per cent.

March

5—U. S. Rubber's net profits $9,776,873.
5—Ford dividend of $48,000,000. Capital increased from $2,000,000 to $100,000,000. Henry Ford's profits $27,840,000.
7—Baker R. & L. capital increased from $1,000,000 to $2,500,000.
10—Goodrich reduces preferred $2,000,000.
13—Lozier gets $5,000,000 new capital.

April

1—Overland surplus for 6 months $2,853,864.
28—Ford to pay over $15,000,000 in rebates to car owners.

May

8—Packard's April sales $3,047,811.

June

16—Reo extra dividend of 12.5 per cent, a total of $450,000.

July

1—Chandler dividend of 77 1-2 per cent on common, making a total of 100 per cent on issue in 1 year.
3—U. S. Tire passes quarterly dividend of 1 1-2 per cent on common.
28—Goodrich 1915 profits $4,000,000. First 6 months show $1,348,922 gain.

August

3—Paige increases capital $750,000.
16—White increases stock $3,000,000 to pay 7 per cent. Former stock amounted to $500,000 preferred and $2,440,000 common. Preferred to be retired immediately at $115 per share plus accumulated dividends.
16—Haynes 100 per cent stock dividend. Capital increased from $600,000 to $1,200,000.

September

1—Firestone declares 4 per cent extra dividend, amounting to 16 per cent for the year. Net profits for year are $4,343,000, a gain of $2,800,000. Sales are $25,187,884, an increase of $5,937,774. Production is 7500 pneumatic tires and 1100 solids a day.
8—Reo pays extra dividend of 12 1-2 per cent.
9—Morton truck capital increased from $100,000 to $1,000,000.
14—Packards built in year number 4908, valued at $15,553,650.
18—General Motors declares 50 per cent dividend. Earned $4,926,322. Seventeen directors on new board.

October

1—Chevrolet capital increased from $2,500,000 to $20,000,000. Now Chevrolet Motor Co. of Del.
1—Hayes Wheel increases capital from $300,000 to $1,000,000. Stock dividend of 166 per cent of $500,000 to be declared.
4—G. M. voting trust dissolved.
4—Swinehart Tire earns 16 per cent on $800,000 stock. Gross earnings exceed $2,000,000 and net earnings pass $135,000.
8—Chevrolet Motor Co. of Mich. now. Current earnings at rate of $2,500,000 per annum or 12 1-2 per cent on stock.
9—Chalmers common listed on New York curb.
11—Perfection Spring raises capital from $1,500,000 to $2,500,000.
11—Disco raises capital from $40,000 to $100,000.
14—Ford surplus gains $10,308,738.59 in 10 months. $43,788,151.23 cash on hand, an increase of $16,346,682.44 over 1914. Total assets $88,535,840.41, an increase on $26,903,583.25 over 1914.
20—Continental Motor Mfg. Co., Detroit, declares 100 per cent dividend. Increases capital $500,000 to $2,900,000. Surplus of $1,200,000 or $500,000 more than 1914.
22—Packard surplus $3,713,747.22. Gains $1,915,926.80. Assets $21,814,153.71. 29,936 cars and trucks built.
23—Gray & Davis increases capital from $1,750,000 to $2,000,000.
26—Canadian Ford capital increased from $1,000,000 to $10,000,000. Dividend of 600 per cent.

November

1—Chandler stock increased from $425,000 to $10,000,000.
1—Maxwell to aid dealers' finances by using part of its surplus in deposits in different parts of country where its dealers are and enable latter to get loans from banks.
1—Studebaker to retire all serial notes amounting to $2,300,000. Company has no debts except current accounts. Working capital will be $22,050,000.
1—H. W. Ford, president of Saxon Motor Co. buys Hugh Chalmers stock and passes into control of company. $500,000 involved. Company will build 28,600 cars.
1—Canadian Ford profits $3,202,458.15. Gain of $1,179,962.09 over 1914. Cash on hand $2,609,997.65.
1—$3,000,000 company to build Lozier cars. Property bought by Associated Lozier Purchasers. Theodore Friedeberg elected president. Will keep property.
4—Chalmers common stock to pay $12 a share starting Jan. 1.
4—Continental Motor Mfg. Co., dividend of $416,000. Company increases capital $2,400,000 to $2,900,000.
5—Goodyear gross business to Oct. 31 totals $36,000,000, or $5,000,000 better than 1914. Over 2,000,000 tires made.
9—Peerless Truck & Motor Corp. earns 19 per cent on new $10,000,000 stock. Based on actual shipments of Peerless Motor Car Co. and General Vehicle Co. for calendar year.
10—Maxwell stockholders approve plan for paying back dividends.
13—Reo 10-months' surplus $3,661,802.20 or $1,969,720.20 over 1914—$2,390,951.60 cash on hand and in banks. Reo Truck assets gain $231,510.09 in 10 months.
13—Hyatt capital increased from $400,000 to $6,000,000 for plant enlargement.
13—United States & Heating Corp. gets working capital of $500,000 through sale of 50,000 shares of treasury stock.
16—Fifth Avenue Coach Co., New York City, earns $1,451,508.10 in year. Carries 14,050,471 passengers in 133 buses during year.
19—Hupp increases capital from $1,000,000 to $6,500,000, divided into $5,000,000 common stock and $1,500,000 preferred.
20—Saxon Motor Car Corp. succeeds company and increases capital from $350,000 to $6,000,000 common.
20—Autocar doubles capital to $2,000,000.
25—Simplex Automobile capital increased from $1,500,000 to $5,000,000.
30—Consolidated Car Co. capital increased from $250,000 to $500,000.
30—Kelly-Springfield Tire reduces common par value from $100 to $25.

December

4—Franklin to increase common to $2,000,000 from $900,000. Preferred stock, amounting to $600,000 is all in treasury of company.
4—Commerce Motor Car Co., Detroit, to increase capital from $100,000 to $200,000.
4—Denby Motor Truck Co. to increase stock from $250,000 to $750,000, of which $500,000 will be common and the balance preferred.
7—Goodyear earns 55 1-2 per cent on common. Sales amount to $36,490,652 and net income is $5,137,082. Assets are $14,500,000.

Registration

January

9—New York registrations 169,966 in 1914.

February

2—Canada has 61,599 car owners in 1914.
13—15,000 Pennsylvania farmers own cars.
15—Iowa has 106,087 cars in 1914.
15—Kentucky registrations number 20,000, an increase of 64 per cent.

March

1—New England gains 48,063 cars in 2 years; 142,497 cars and trucks in 1914, or 52 people per car.
25—United States has 1,754,570 cars in 1914, showing a gain of 500,695 over 1913. Increase of 1,077,570 in 4 years.

April

3—37,990 Michigan licenses in 2 months.
3—120,296 cars and trucks in Ohio.
8—Ontario has 34,000 cars.
17—New York State has 168,598 cars; 50,000 cars ahead of 1914.
21—California registration is 131,123.

June

11—144,750 cars and 1400 dealers in Ohio.
14—66,745 cars in Wisconsin, the 1914 registration being 53,161.

July

3—Canada has 77,339 cars, divided into 1155 trucks and 68,320 cars, with 1120 dealers.
15—Colorado has 21,826 cars and trucks, an increase of 5000.
17—Massachusetts registration is 83,868 cars and trucks, a gain of 27.5 per cent over 1914.
23—Oklahoma has 32,000 cars.

August

12—United States has 2,070,903 cars. Registrations for the first 6 months of 1915 show gain of 334,809. Output of 625,000 cars predicted.

September

14—New York State has 212,882 cars; 168,000 in Ohio; 166,886 in Illinois; 151,523 in Pennsylvania, and 150,232 in California.
16—Michigan registrations during the first 6 months are 91,683 cars and 2499 trucks. A gain of 20,000 over 1914 total.

October

2—Iowa has 140,168 cars; 36,000 more than 1914. Farmers big factor in 33 per cent gain.
8—Kansas has 2487 tractors.
8—Wisconsin has 78,169 cars, a gain of 25,008 over 1914 total.
9—Ohio has 176,428 cars. Nearly 50 per cent better than 1914 total.
9—New York State has 222,025 owners; 164,438 in 1914 up to Oct. 1; 1914 total was 170,171.
9—Iowa has 150,000 cars; 50,000 cars bought in 1 year. Cars average $800 to $900 in value.

November

1—Rhode Island has 14,017 cars. Fords number 4413 and Cadillacs 1070.
6—New York State has 227,467 cars; 57,296 more owners and dealers than in 1914. Chauffeurs number 77,675.

13—Iowa 3-year license law in force Jan. 1. Machines registered 4 years will be registered for ¼ regular fee.
20—Wisconsin has 79,759 cars, as against 53,161 in whole year of 1914; 26,600 new cars bought in 1915.

December

8—New York State up to Dec. 4 has 231,713 registrations, divided into 171,698 cars and 22,949 trucks. Dealers number 2194.

Miscellaneous

January

2—1200 London buses commandeered.

February

26—Germany cuts private car use 50 per cent to save in consumption of gasoline, rubber and oil.

March

6—London buses carry 734,000,000 in 1913.
6—Motor buses stopped in Berlin.

April

15—341,250 motor vehicles in United Kingdom.
15—New South Wales has 10,001 cars in 1914.
20—Italy to take over automobile plants.
26—War rushes French plants.
18—$4,467,453 for Paris Bus Co. from the French war department to compensate for vehicles requisitioned. No buses in Paris.

July

1—$108,191,774 for roads in 1914. Over 6000 miles of new roads added and over 35,500 improved during year 1914 in thirty-five States.
17—Only passenger cars allowed in Yellowstone Park. $5 fee for runabouts—$7.50 for five and $10 for seven-passenger cars.
24—France orders machinery declared.
26—Blue Book to add a volume. Will cover territory below Potomac and Ohio rivers—New index maps.
27—Lincoln highway route changed. Washington and Baltimore to be included.

August

1—Yellowstone Park opened to tourists.
6—Britons would protect motor trade by high duty.
8—English Ford sells 12,500 cars. War has not affected English business. Fifty per cent increase.
7—French car owners must pay taxes despite war.
28—Michelin French plant rushed. Produces 6000 tires a day.
28—$49,000,000 for rural delivery by U. S. post office department. $2,000,000 saving effected.

September

3—Cut accidents 54 per cent at Ford plant by teaching of English to workers.
18—Post office department authorizes 500 automobile rural routes. Cost per mile for automobile is $0.034.

October

1—Great Britain imposes 33 1/3 per cent import duty on automobiles and parts.
7—France to fix price of alcohol. Denatured product becomes government monopoly on Jan. 1, 1917.
9—Austria confiscates all tires.
9—Gasoline shortage in Paris. Fuel famine for first time since war began—Price, 42 cents.
11—Blaze Dixie highway trail. First official inspection tour from Chicago to Florida.
16—Spain has 10,548 cars, or one car to every 1896 persons.

November

1—Gasoline shortage in Paris threatens to stop taxicabs.
6—Community garage developed in Jackson County, Wis. Promoters to sell one share only to each automobile owner. Will provide service.
13—American motorists given 10 days to tour in Canada free by Customs Department at Ottawa.
30—Setback for U. S. cars in France. Agency negotiations affected by 33 to 45 per cent duty to be imposed.

RUBBER

January

1—Rubber imports from Para from Nov. 28 to Dec. 22 amounts 4,876,000 lb.
11—Great Britain agrees to permit rubber exports to U. S. from London via the British Consul General in New York.
23—Lusitania arrives with 200 tons of rubber with 1000 more on Menominee.

February

16—Rubber control committee appointed to handle situation in regard to certain agreements in the shipment of rubber from England to the United States.

March

1—Rubber imports from England in 1 month amounts to 4,859,200 lb.
13—Process for making synthetic rubber from crude oil discovered.
18—Rubber substitute made of coal tar, which is the chief ingredient.

July

27—No tires on cars for export to neutral countries.

August

27—South America ships 3,008,114 lb. rubber to the United States during the year, as against 1,035,396 in 1914.

October

6—Great Britain taxes 2 3/8 cents a pound on Ceylon rubber shipments from London to the United States.
23—142,000 tons of rubber predicted for 1915. United States to use 75,000.

November

6—No tire shortage in England. Manager of Goodyear Co. of Great Britain states business is tranquil.

1915—A Record Year for Speedways

(*Continued from page* 1133)

by Anderson in a Stutz with Cooper in a Stutz second. The winner averaged 77.256 m.p.h., as against 73.53 m.p.h. in 1914. The C. A. C. trophy, held the previous day, went to Cooper, with Anderson second, the winner's average being 74.979 m.p.h. as against 73.90 m.p.h. in 1914.

Two companies, prominent in the 1914 season as backers of racing teams, withdrew from racing in 1915. Stutz announced its indefinite withdrawal after the Sheepshead Bay speedway race, Oct. 14, and Maxwell, which had seven racers on the tracks up to July, 1915, was the other. Four of its cars were taken over by the Prest-O-Lite Co., which formed a company to race these cars on the speedways.

Racing in 1915 was fortunate in having few serious accidents. Only three deaths occurred at the important race meets and about two at the small track events. Harry Grant died Oct. 8 from burns suffered when his Maxwell took fire in practice. Joe Cooper in a Sebring was killed at the Des Moines speedway Aug. 8. Albert Johnson was killed when a Packard test car at the Indianapolis Speedway turned over from a blowout while going 86 m.p.h. Wm. Carlson was killed at Tacoma.

Fuel efficiency and economy tests in 1915 were gone into extensively by the automobile and accessory manufacturers. Four fuel and economy tests were attended by A. A. A. representatives, and a number of the automobile and accessory companies made unofficial tests with their products.

Under A. A. A. sanction Stromberg held a test Sept. 16 in Chicago with a Buick six which averaged 27.5 m.p.g. and in a speed test 56.2 m.p.h. In an acceleration test the car went from 0 to 30 m.p.h. in 11 1-5 sec. through first, second and third-speed gears. On high alone it accelerated from 5 to 25 m.p.h. in 12 2-5 sec.

Another official test was that of the Packard twin six in July at Chicago speedway when it made 50 miles in an economy run, averaging 13.3 m.p.g. In an acceleration test it went from 5 to 30 m.p.h. in 13.60 sec. and from 5 to 50 m.p.h. in 26.20 sec. In a speed test it went 10 miles at the rate of 72.9 m.p.h.

An Oakland touring car with a Marvel carbureter at Chicago on Jan. 27 made 13.1 m.p.g. in a fuel economy test. A roadster, also equipped with a Marvel carbureter, made 27.3 m.p.g.

A Buick equipped with Edwards carbureter averaged 28.9 m.p.g. and 58 m.p.h.

A number of unofficial tests were made in 1915. A Detroit electric made a 2065-mile run which cost $29. In a fuel economy test 137 Franklins averaged 32.1 m.p.g. An Owen Magnetic averaged 34.1 m.p.h. for 1935 miles in a trip from New York City to Indianapolis, averaging 12.8 m.p.g. A Chandler six completed a non-stop run across the United States, making 1889.5 miles from Mexico to Canada in six days. A Maxwell, driven by Ray McNamara, made Detroit to Indianapolis and return in 20:1. In a Maxwell efficiency run, Miss Eva Cunningham, the winner, drove 567 miles on 17 gal. of gasoline or 33.37 m.p.g. A Franklin in an oil consumption test traveled 1046 miles on 1 gal. and averaged 16.7 m.p.g. for gasoline consumption. E. C. Patterson in a Packard 3-38 touring car covered 1015 miles, Chicago to New York City, in 35:43, or 24.48 m.p.h.

The 1916 racing season will be opened on May 13 at the Sheepshead Bay Speedway. Next year's racing schedule is placed on a more systematic basis. With the exception of two clashing dates on July 4 at Minneapolis and Sioux City, the rest of the dates are arranged so as to fall, in a majority of cases, about two weeks apart. Sixteen dates, in all, have been allotted ten cities. Two spring races are scheduled, one at New York and the other at Indianapolis on May 30. Following these are two for June, one on the 17th at Chicago and the other at Des Moines on the 28th. Then come three for July, two for August, four in September, and two in October, the closing speedway event of the year being at Chicago on the 14th.

Industry Adds 11,142,508 Sq. Ft. in 1915

(*Concluded from page* 1134)

Barley has added 59,879 sq. ft. and has purchased $20,000 worth of new machinery, etc. Sterling has increased its space 36,500 ft. at a cost of $35,000 and Commerce and Gramm have each added 30,000 sq. ft., Gramm at an outlay of $30,000 and Commerce expending $35,000. Gramm also added $15,000 in new equipment during the year.

The three companies occupying or arranging to occupy new plants are: Federal, which will have 140,000 sq. ft. of space available about the first of the year; Vim, which is building a new factory in Philadelphia to contain 487,600 sq. ft. at a cost of $1,000,000; and Ware, which is preparing to occupy a new four-story plant of 200 ft. frontage which cost $51,000.

Expansion by Parts Makers

There has been a great deal of building activity among the axle manufacturers. Timken adding 200,000 sq. ft. at an outlay of $1,125,000; Walker-Weiss, 135,000 sq. ft. costing $50,000, and in addition $30,000 worth of new equipment; and Torbensen 40,000 ft. costing $100,000.

In the bearing field there has been almost unprecedented expansion, largely due to the stoppage of European bearing importation by the war. Nearly all the larger makers have made tremendous expansions, among whom might be mentioned New Departure, Hyatt, Hess-Bright, Timken, Gurney and Fafnir. S. K. F. is preparing to occupy a new plant containing approximately 348,480 ft.

Continental leads the motor manufacturers in expansion made during the past year, adding 300,000 sq. ft. at an outlay of $200,000 and expending $300,000 for new machinery, etc. Rutenber added 46,560 ft. at a cost of $27,355 and bought $73,115 worth of new equipment, while Waukesha increased its facilities 40,000 sq. ft. by the expenditure of $39,000 and added new factory fittings costing $35,000.

Huge Expansions by Tire Companies

A review of the tire field shows that the past year will apparently come close to being a record for the manufacturers, many of them having been forced to make very large expansions of their factory facilities. Goodrich and Goodyear made the largest additions, the total combined space of these running well over 1,000,000 sq. ft., while the cost represented an outlay of somewhere in the neighborhood of $1,500,000 to $2,000,000. Firestone and Fisk added 435,600 and 348,489 sq. ft. respectively, while Miller added 130,680 sq. ft. and Continental 85,000, the latter at an expenditure of $130,000.

The purchase of the Federal company at Milwaukee by the Fisk interests as reported in THE AUTOMOBILE last week will greatly increase the capacity of the organization.

Gear Makers Increase Equipment

The gear manufacturers have made a number of large additions to their factories, but the main feature of factory expansion in this field during the past twelve months was the increase in equipment. For instance Brown-Lipe-Chapin added 80,000 sq. ft. at a cost of $120,000, and purchased new machinery, etc., to the value of $500,000; New Process increased its space 140,000 ft., spending $240,000 on new equipment; Warner Mfg. Co. spent $200,000 for equipment and the T. W. Warner Co. expended $100,000 for the same purpose. Covert spent $10,000 also adding 17,500 sq. ft. to its plant at a cost of $35,000. Gemmer added 30,000 ft. and Detroit 12,000 at an outlay of $30,000, also spending $90,000 for new equipment. Timken-David-Brown is making an addition and purchasing sufficient equipment to enable the plant to quadruple its present production.

The same conditions prevail among the spring manufacturers as in the gear field, though perhaps in a more limited degree, Perfection has added 54,525 sq. ft. at a cost of $110,000 and has bought new equipment worth $109,000; Hess has added 45,000 at an outlay of $60,000 with $5,000 worth of new machinery, etc., and Tuthill has installed new equipment to the extent of $2,700.

Magneto Factories Enlarged

Factory additions have been the rule among the larger companies manufacturing magnetos, Bosch increasing its space 60,000 sq. ft. at an outlay of $125,000, and spending $50,000 for new machinery, etc.; Splitdorf adding 100,000 sq. ft., and purchasing the Sumter concern for $1,000,000; Simms increasing its space 9420 at a cost of $15,000 and expanding $100,000 on new equipment; and Eisemann adding 30,000 sq. ft. and buying machinery, etc., worth $40,000.

Activity in the way of new factory buildings has not been so marked in the carbureter field. Rayfield's addition was 12,000 sq. ft. at a cost of $30,000, with $25,000 worth of new machinery; Kingston's increase was 12,123 ft. costing $4,500 and $5,000 worth of equipment; and Breeze added 6000 ft. at a cost of $15,750, expending $12,000 for new equipment. Holtzer-Cabot has a new factory giving 150,000 sq. ft. of floorspace, while Master's new plant, which cost $50,000, provides 26,624 ft. and new equipment represents $35,000.

Casting and Forging Companies Expand

A number of the casting companies have made additions to their plants and equipment. General Aluminum & Brass Mfg. Co., has added 50,000 sq. ft. at a cost of $40,000, with $60,000 worth of new equipment. Harley added 30,000 sq. ft. at an outlay of $50,000. The Metal Products plant of the Timken-Detroit Axle Co. has made additions to its main plant and heat-treating department and has doubled its output in the past six months. National Bronze & Aluminum Foundry has added 15,000 ft. at a cost of $15,000; Atlas Brass Foundry 3360 ft. at a cost of $4,500 with $1,500 new equipment.

In the Accessory Field

In the radiator field, Fedders has increased his facilities 110,000 sq. ft. at an outlay of $100,000, spending $60,000 more for new equipment. McCord has added 19,500 sq. ft. to the main factory in Detroit and acquired two new factories, one at Wyandotte, Mich., containing 22,000 sq. ft. and to be used for gasket and stamping business and the other, for radiator manufacture, in Detroit and containing 65,000 sq. ft., the total additions for the year being 106,500 ft.

Of the wheel makers Salisbury has increased its plant by 30,000 ft. at an outlay of $25,000, spending $115,000 for equipment, a feature of the additions being the new office building.

Stewart-Warner Speedometer Corp. has added 275,000 ft. while the VanSicklen company has a 48,000-ft. new factory and has spent $80,000 for new equipment.

Of the spark plug makers, Champion Spark Plug Co. of Toledo, has added $160,000 worth of new equipment while the Champion Ignition Co., Flint, Mich., has increased its space by 12,172 ft. at a cost of $20,000 with new equipment worth $29,800. Gibson-Hollister has occupied a new factory 100 by 200 and has made an addition 40 by 100 costing $7,500, new machinery, etc., representing $8,375 being purchased during the year. Pittsfield Spark Coil Co. has occupied a new factory of 12,000 sq. ft.

Two manufacturers of brake lining have made considerable expansion during the past year. The Standard Woven Fabric Co. has occupied its new $300,000 plant containing 200,000 sq. ft. and has purchased new machinery equipment worth $150,000. The Royal Equipment Co. has added 35,000 sq. ft. at a cost of $110,000 and has spent $50,000 for new machinery.

New Marmon Is Unique Car

Remarkable Acceleration Obtained by Light Construction —Aluminum Motor, Special Frame, New Type Springs, Novel Body Construction—A Really Scientific Car

THE year 1915 has been one of new things throughout the whole automobile industry, never before have there been so many interesting new cars announced than during the past twelve months, and of the long list none will rank higher in interest than the new Marmon.

Possessed of years of experience in the manufacture of the largest and most powerful class of costly car, the Marmon company has now turned its attention to making a vehicle that will out-perform any it has made before and at the same time weigh vastly less. The new car is in every sense a luxury machine, yet it is 1000 lb. lighter than the great majority of automobiles in its class.

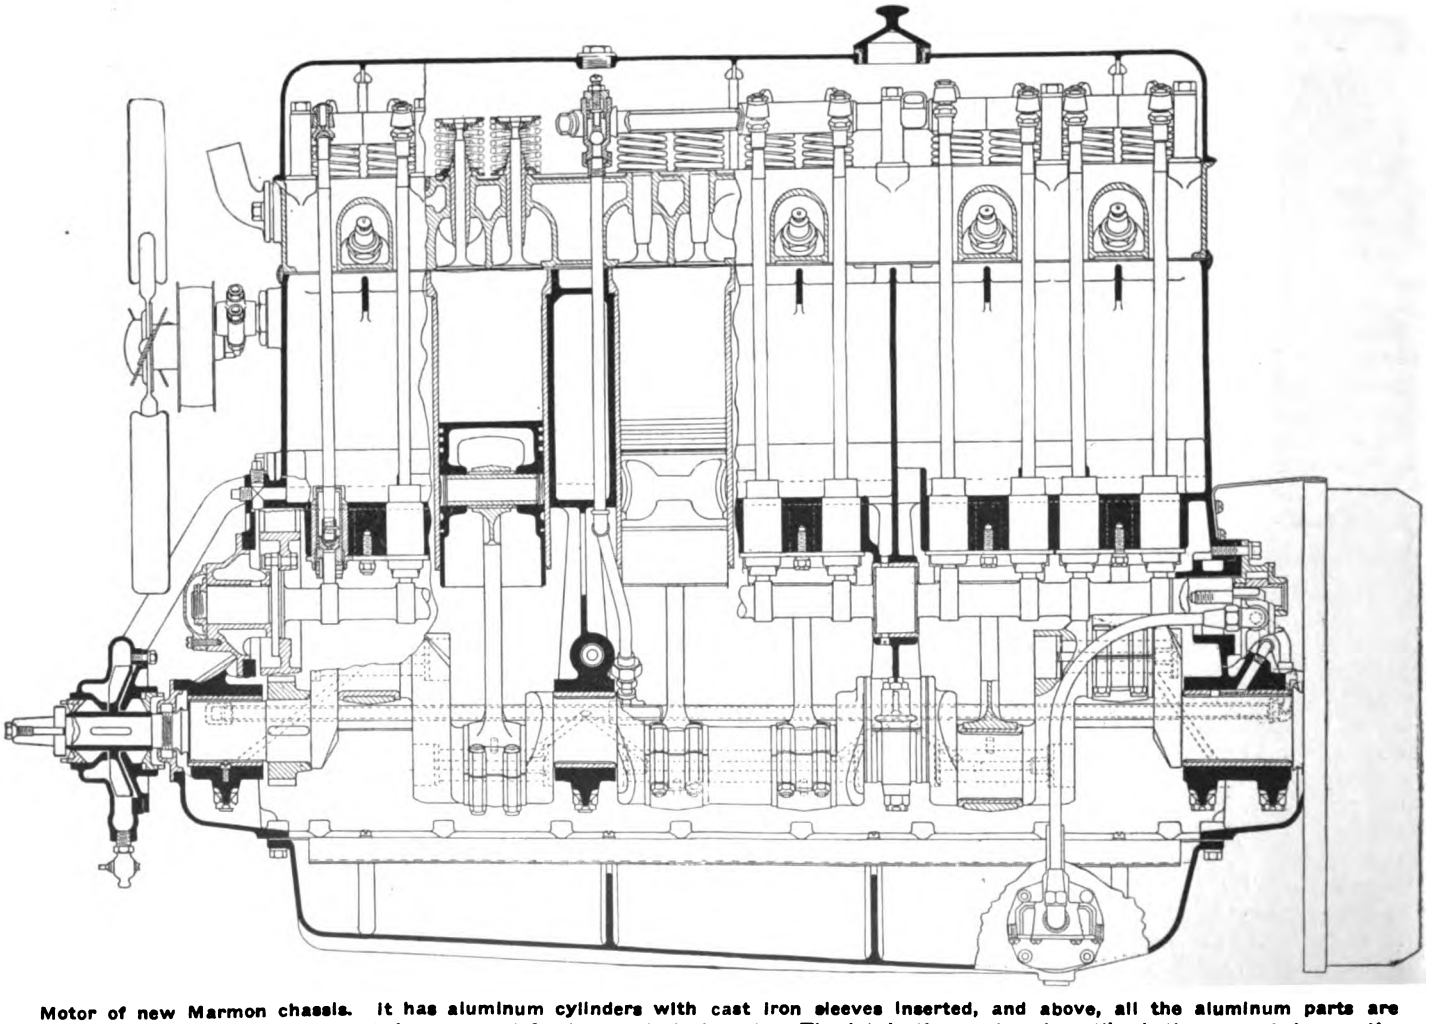
As a performer on the road its accelerative power on high gear is indicated by its ability to speed up from 10 to 50 m.p.h. in substantially less than 18 sec. Its maximum speed is between 60 and 70 m.p.h., it seats seven passengers with the comfort which is expected of the most expensive cars, and it has an unexcelled ease of steering and control.

The light weight has been secured by means of highly scientific design in combination with careful choice of material. There is much aluminum employed and much high tensile steel in thin section. The new car is new from stem to stern, from the motor to the rear axle no single opportunity has been missed where there was a chance to increase efficiency or reduce weight.

With this preamble the detail of the specifications may be considered, and some more concerning the performance of the car will be given later.

The engine is the first automobile motor to be placed in regular production with an aluminum cylinder casting. It is a six 3.75 by 5.125 in. with a piston displacement of 339.7 cu. in. The cylinders are cast in block with a detachable head and all the valves are located in the head, but the camshaft is in the customary position. The valves themselves are 1.75 in. clear diameter with a lift of ⅜ in. and the engine develops over 70 hp. at 2500 r.p.m. Thus the motor is not only a large six but a six of high efficiency.

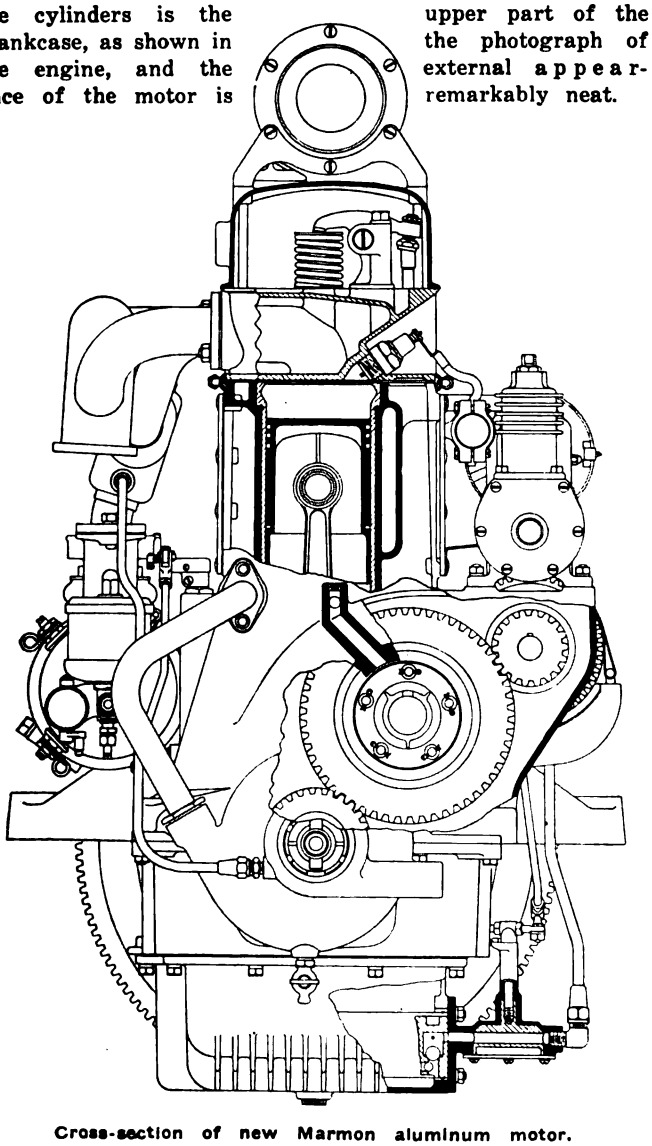
On the score of vibration the ever-present tendency to



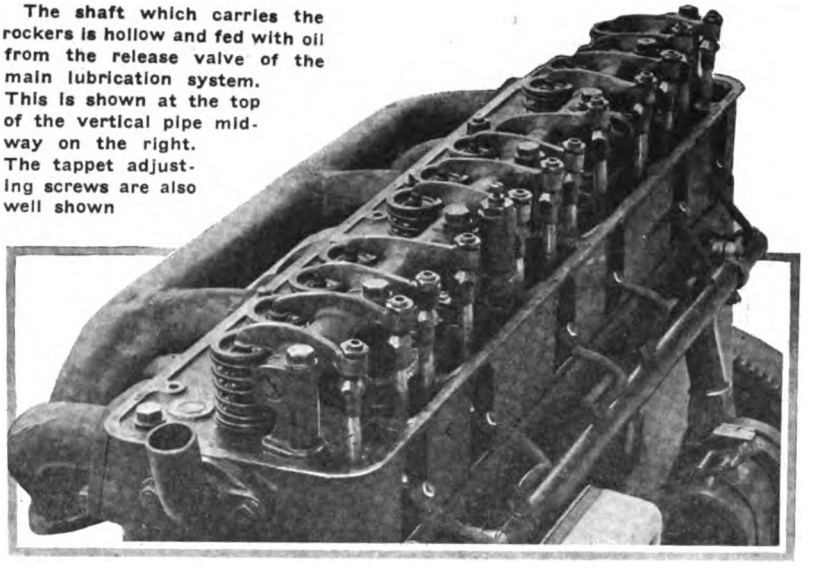
Motor of new Marmon chassis. It has aluminum cylinders with cast iron sleeves inserted, and above, all the aluminum parts are shown in black, the section lining being reserved for iron and steel parts. The lubrication system is outlined, the pump being on the camshaft and the oil throttle valve on the end of the suction pipe in the crankcase. It is connected to the carbureter throttle

crankshaft deformation in a six has been countered by the use of a 2.25 in. crankshaft with four main bearings, there is no detectable vibration at any speed between 3 and 65 m.p.h. Quietness has been attained to a high degree, the complete inclosure of the overhead valves eliminating sound from the tappets more effectively than is the case on most motors of normal design. Absence of torsional oscillations in the crankshaft renders it easy to make silent the front end gears, and there are no accessory drives which can easily produce noise. It is no exaggeration to say that there would be extreme difficulty in judging the number of cylinders except by the nature of the exhaust at low car speeds.

Nor is this motor geared very low on high gear in order to give the remarkable ability which the car exhibits since the ratio is 3.69 to 1 with 34-in. tires, giving a crankshaft speed of 1095 r.p.m. at 30 m.p.h. Into the aluminum cylinder block thin iron sleeves are pressed after machining is completed, in order to provide a working surface for the pistons, which are also aluminum alloy made by the permanent mold process. At present the head casting which carries the valves is iron, but it is hoped to be able to make this also in aluminum with iron valve seats when the supply of castings becomes a little more plentiful. Cast in unit with the cylinders is the upper part of the crankcase, as shown in the photograph of the engine, and the external appearance of the motor is remarkably neat.



Cross-section of new Marmon aluminum motor. Observe that these timing gears suffice for all drives. The excellent cooling round the valves is well shown



The shaft which carries the rockers is hollow and fed with oil from the release valve of the main lubrication system. This is shown at the top of the vertical pipe midway on the right. The tappet adjusting screws are also well shown

Lightness in the power plant does not depend solely upon the utilization of aluminum however, since simplification of design also plays its part. For instance, there are but three timing gears, a pinion on the crankshaft and one for the generator and magneto drive with the large camshaft gear intermediate. The water pump is ingeniously made up on the front end of the crankshaft, the material being aluminum and the packing glands of very large size and very easy to tighten.

Lightness Obtained by Ingenious Design

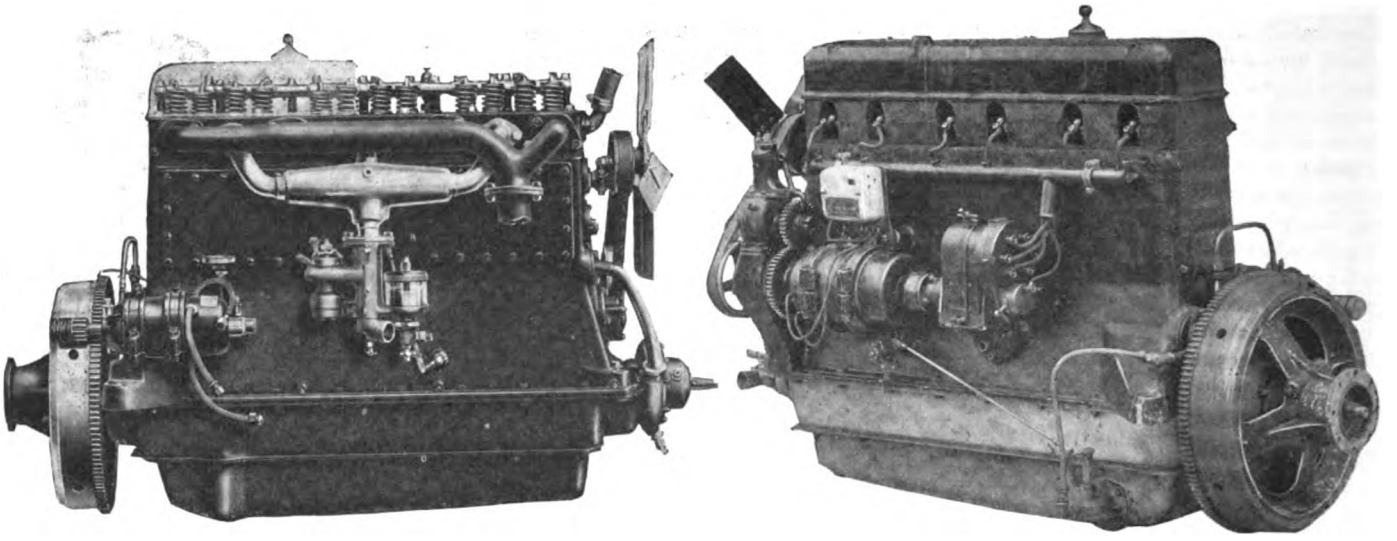
In the valve gear lightness is obtained in every detail. Tappets are die-cast with large bearing surface and a minimum of material for the size, the long push rods which connect with the rockers are aluminum alloy with steel ends, the rockers are highly finished forgings of alloy steel and the valves themselves are light for their size.

A point which doubtless assists quiet operation is that the push rods are inclosed entirely, and adjustment is provided on the rocker ends. The ends of the push rods are hemispherical and fit in sockets in little screwed set pins which are locked by split, conical seated nuts; the adjustment is rapid and delicate, while the locking is absolutely secure.

One reason that the overhead valve motor has not been more popular is the difficulty in lubricating the parts properly. In the Marmon this is cared for by making the rocker shaft hollow, and pumping oil to it, whence it escapes through the bearings and returns to the crankcase. Each little set screw which bears on the upper end of the push rod is hollow, and oil spray keeps it filled, so maintaining lubrication at this point, while overflow passes down the rod and cares for the lower end. Altogether the valve system is lubricated much more efficiently than is usual on L head motors and the precautions for draining the surplus are such that there is no possibility of oil seeping down the valve stems and so reaching the combustion chamber.

As to the main oil supply, this is controlled in an unusual way. On the rear end of the camshaft is the gear type pump, partly contained within the crankcase casting, and this sends oil to the four main bearings of the crankshaft, thence through drilled holes to the lower connecting-rod ends and thence by spray to the cylinders and wristpins.

It has been explained that oil is fed to the hollow rocker shaft, but this is not sent up under full pressure. At the center of the main oil lead, which is cast-in the crankcase, there is a vertical standpipe at the top of which is the pressure release valve, and it is through this release valve that oil goes to the rocker shaft. Also, besides the other oil feeds, the tappets are contained within a chamber separate from the crankcase proper and this is kept filled with oil so the



These views of the motor show its remarkable cleanliness and the great accessibility of the electrical units and of the carbureter

cams and the tappets operate beneath the surface of a tankful of lubricant.

Again, the oil supply is regulated in proportion with the work done; when the throttle is wide open the pump receives a full supply and delivers full pressure, but when the throttle is closed a constriction is put upon the suction intake of the pump and the supply thereby cut down. The device is a simple tap of large dimensions, and it is so arranged that no maladjustment can shut off the supply entirely; the tap is a loose enough fit to permit the passage of a great enough supply to feed the engine adequately when idling. The effect of the control is greatly to economize oil and to reduce the tendency to carbonize, already greatly reduced by the extremely efficient cooling furnished by the aluminum pistons and cylinders.

Engine Wonderfully Accessible

The engine is one of the most accessible ever built. An easily removable cover lays bare the valves in a moment, the carbureter, a Stromberg, stands high on the right side, the Bosch generator and magneto equally high on the left. The glands of the water pump can be reached without effort, the oil pump and the oil throttle are both removable without disturbing any other parts. As can be seen from the photograph, the spark plugs stand in the side of the head casting, and have wires of only a few inches in length, while all but three of the lighting equipment wires are centralized in the control box which is mounted upon the generator. The oil filler is in the extreme top of the cylinder block and the level gage is a quadrant situated horizontally just beside the carbureter. There is nothing which requires to be "reached" for. Carbureter accessibility and the accessibility of the starting motor is enhanced by bringing the exhaust manifold down at the front end of the motor, and this also keeps the heat away from the driver's compartment.

The foregoing deals with the main features of the motor, but there are many points of minor importance displaying as great an ingenuity; they are mostly made clear in the illustrations.

Frame Is Elaborate Structure

Passing on to other parts of this novel car, mention may next be made of the frame, since this is another place where much weight has been saved. In section the sills are narrow, and of thin stock, but the depth is 10 in. and use is made of the steel running-boards to provide much of the strength. The main side pieces end with the running-board, which is upswept at this point, so forming the front end of the mudguard, and the end of the body is supported by a separate portion riveted to the principal side pieces. Across this is a deep, cross member which makes the tonneau heel board; so the rear end of the body consists of nothing more than the back and sides of the seat. Although of such thin steel, the frame has its various parts so proportioned that the dead metal is reduced to a minimum, and it is thus stronger than usual as well as lighter.

Next, the body becomes light by virtue of the frame construction, as there are but three pieces, the cowl, the front seat and the rear seat. These are of sheet aluminum on light wood frames and carry the doors, which are remarkably free from shake owing to the immense rigidity of the very deep frame section. Thus properly speaking there is no separate body, both body and chassis are a unit and reduplication of strain bearing parts is thus eliminated completely.

However, to return to the chassis, the gearset is located on the forward end of a long torque tube, so forming a unit with the rear axle, and the clutch connects to the gear shaft by a universal joint, the only universal on the car. The clutch itself is the only part which is almost unchanged from previous Marmon practice, it being a fabric cone with aluminum center, the flywheel having the cushion spring inserts which have been largely instrumental in making the Marmon clutch so successful with large, powerful engines.

To suspend the end of the torque tube so that the rear axle shall have freedom of movement in all directions, there is a very large ball and socket joint, the ball being secured to the gearbox and the socket to the frame. Then, to connect the gear shaft to the clutch is a short shaft with a universal at the rear end and a universal coupling at the front end. The latter consists of a gear wheel with rounded teeth, set into an internal tooth gear which is part of the clutch. The centers of the ball support and the universal are as nearly as possible the same, so very little motion is put on the front end coupling.

Clutch Draw Combines Brake

In the center of the short clutch shaft are three collars like the thrust collars of a marine propeller shaft, and inclosing these is a casing which is oil retaining and forms the

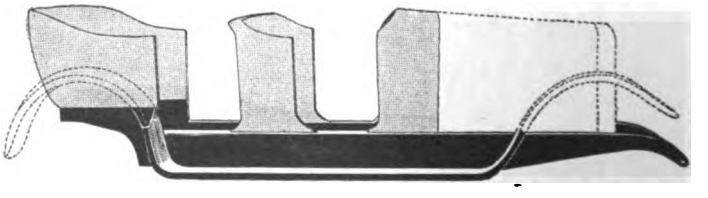


Diagram of the Marmon unit body construction. The main frame is also the body frame and there are no wood sills

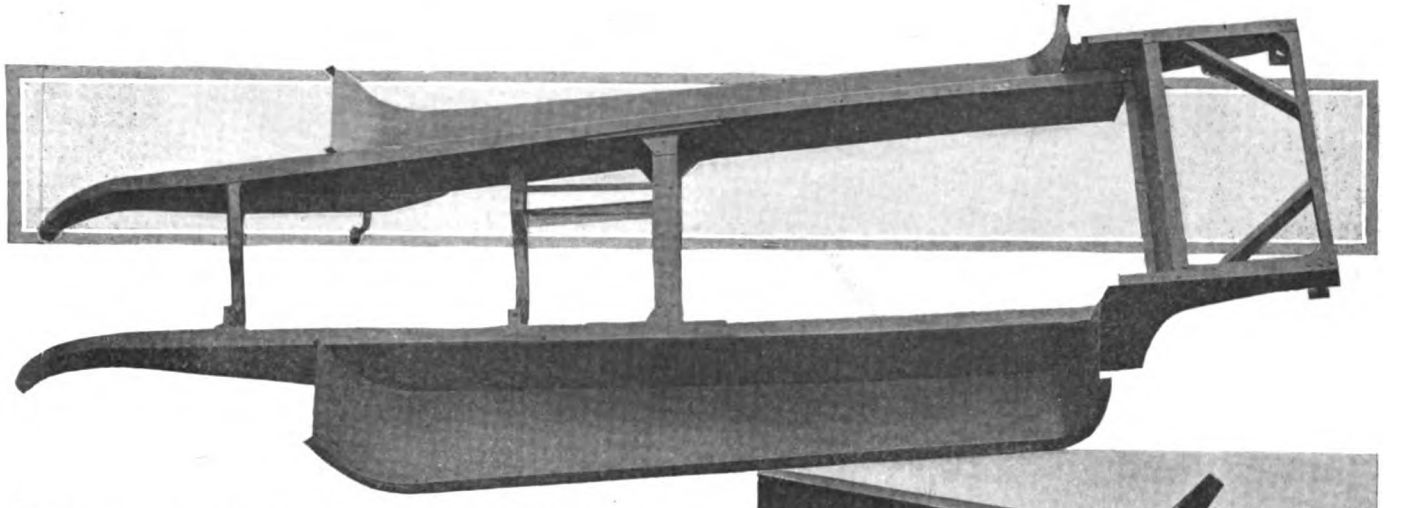
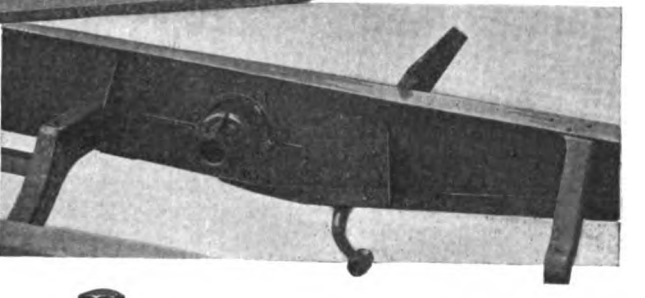
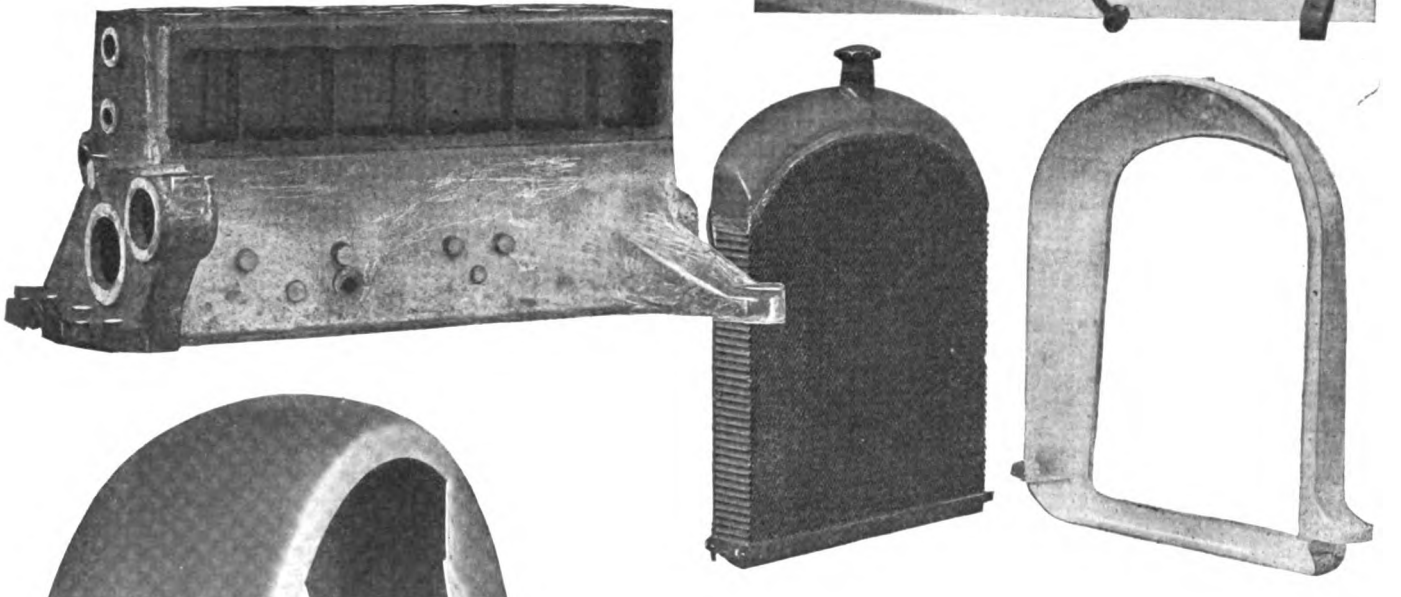
Some Parts Contributing To Marmon Lightness

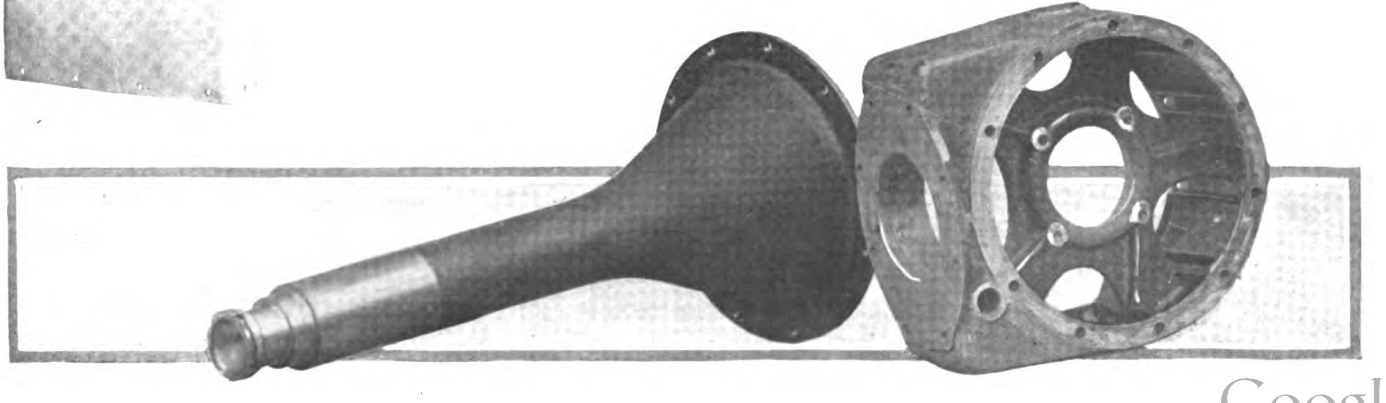


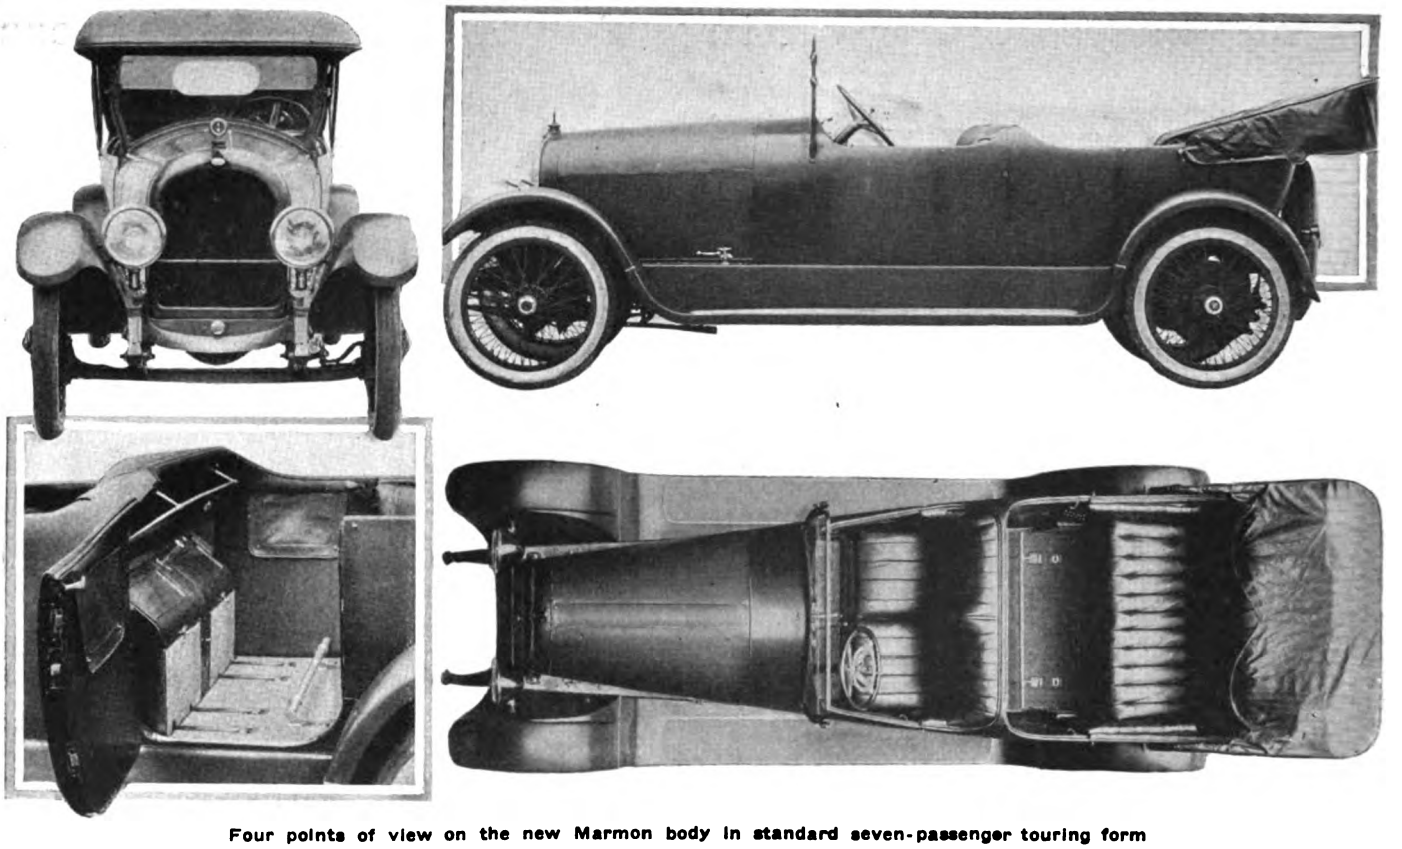
The frame is so designed that every ounce in it does work, even the running boards supply stiffness and carry weight. It is made of many pieces of thin steel and the details are carefully joined by rivets. The small view on the right shows detail of this riveting at the point where the steering gear is attached and the left running board is bent up to form a portion of the fender





The aluminum casting for the cylinders as it appears in the rough state shows the compartment in which the push rods lie. The radiator shell is an aluminum casting of great rigidity, insulating the more delicate core from shocks and strains. The fenders are made from single sheets of stout aluminum and the rear axle has an aluminum center case with thin, cold drawn steel tubes





Four points of view on the new Marmon body in standard seven-passenger touring form

medium for clutch withdrawal, the lower end of the pedal linkage pressing on this case. The plain thrust collars provide a natural amount of friction for the purpose of braking the clutch but not so much as to interfere with the ease of changing down from a high to a lower gear. A quick change down and a leisurely change up can be performed with equal ease.

Since the front coupling of the clutch shaft is held from oscillation by a spring there is no chance for the development of rattle and the universal, being so far from the axle, has a minimum of movement. Incidentally, its accessibility is enhanced by its situation in front of the gearbox, so it is far easier to replenish lubricant than if in the customary place. In designing the gearset, which provides three speeds, the aim has been to obtain the greatest possible degree of quietness, hence the countershaft is stationary and the gears revolve upon it on plain bushings. For the main shaft Hyatt roller bearings are employed with a Hyatt spigot bearing and a single ball bearing to support the front end of the constant mesh pinion and care for thrusts.

The driveshaft is tubular and contained within a drawn steel tube, having a casing at the front end to which the gearbox is bolted. Within this case is a skew gear drive for the speedometer and a disconnecting coupling which joins the driveshaft and the gearshaft. Also on this case are the ends of a pair of rods which run to the outer ends of the axle, for the purpose of triangulating and stiffening the unit. In connection with these rods is a petty detail which is typical of the care and thought displayed throughout the car, for the yoke pins which secure the rod ends to the axle and to the gearbox are taper, and fit in taper sockets, so that when driven in with a tap from a hammer all slack is taken up.

Rear Axle Light, but Strong

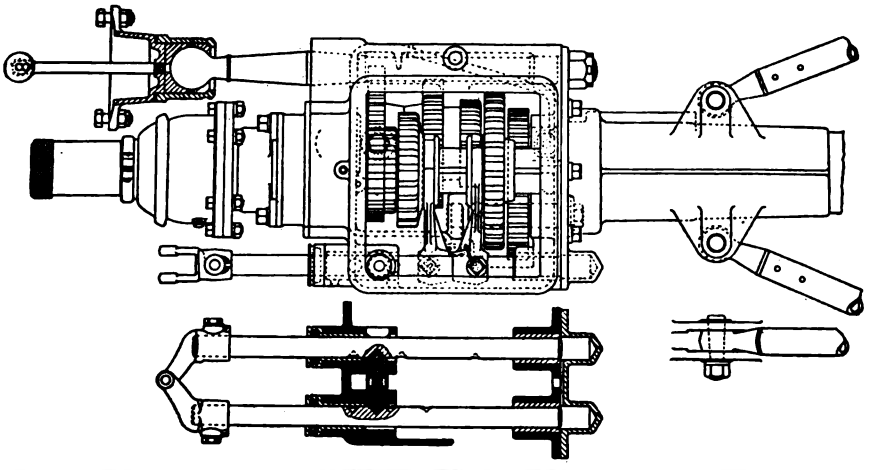
Coming to the rear axle, this contains one of the finest examples of cold drawn steel work ever found in an automobile, the tubes being each made from a single billet of steel in the Prest-O-Lite plant at Indianapolis. The center case is an aluminum alloy casting and carries everything connected with the gears. Located at the geometric center of the spiral bevels is a double row ball bearing and, being in this position, it supports all driving stresses. The other end of the differential carrier, behind the ring gear, thus requires only a steady bearing, and this consists of a large Hyatt roller set in a conical socket which takes its own natural place in the conical steel tube. The driveshafts are secured to the hubs, and can be withdrawn from the differential, while the wheels are mounted on large, single row ball bearings.

To carry these bearings a piece of steel is turned, socketed into the end of each conical tube, and then riveted in place. There are no castings or forgings to hold the brake cams; instead, dished steel pressings are used, also riveted to the main tubes, and having attached to them the necessary small bushings to carry the brake operating shafts. The brakes themselves are conventional, 17½ in. diameter and 2 in. wide, the operating toggles being of such proportions that exceptional power is provided. To prevent egress of oil through the wheel bearings, multiple felt washers are put in each end of the axle, and a screw thread cut on the driveshaft carries excess oil always inward back toward the axle center.

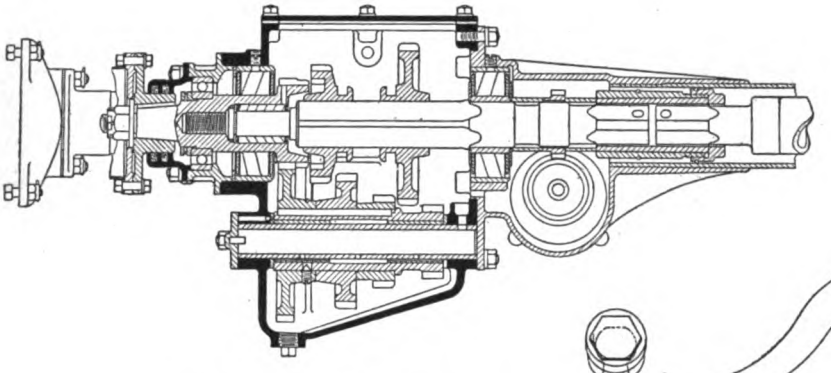
Springs Have Variable Period

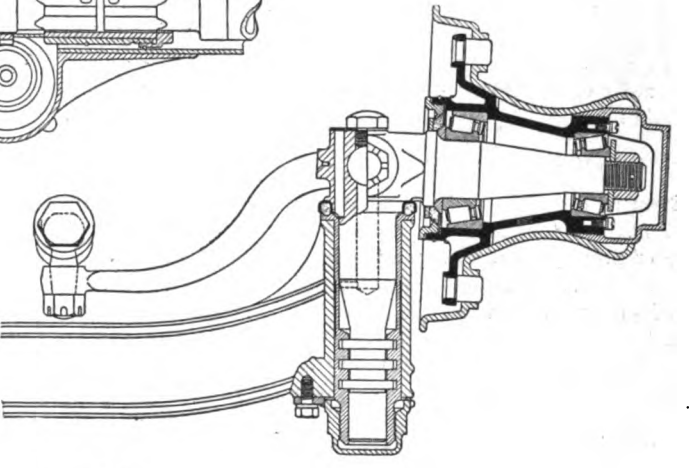
For springs the front axle is attached through semi-elliptics which have no abnormality save that some reversed leaves are placed on top, this making the spring much easier in action and taking out harshness. It has the effect of a shock absorber. At the rear the springs are unconventional, there being two of semi-elliptic form set transversely one above the other and back to back. To follow the action it is necessary to refer to the photograph which shows that the upper spring is slightly the shorter and that there is a piece of wood between the pair cut to a curve and with projecting ends.

On the right side the springs are attached to simple pins on the axle and frame respectively, while each spring is shackled at the other end. Taking a bump which is equal on both wheels both springs operate together and as they compress they come more and more into contact with the wood, which spreads the width of support and, by thus effectively shorten-

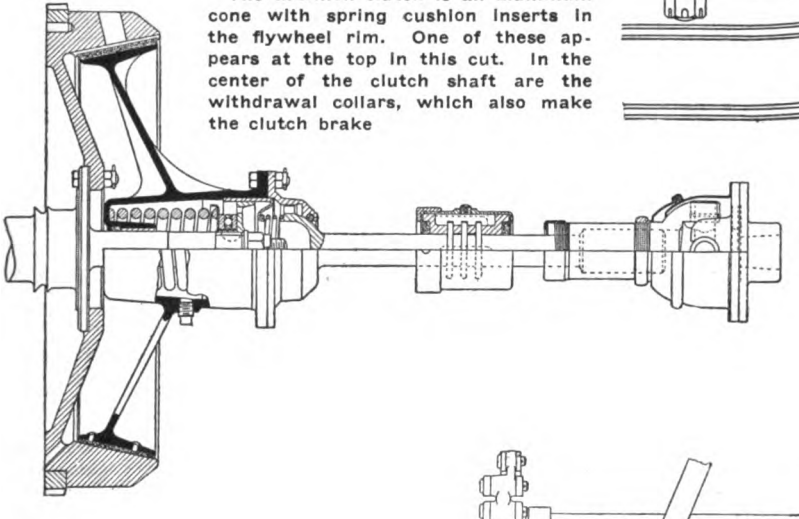


The chief points to observe in the drawing of the Marmon gearset are its method of assembly as the front end of the torque tube and its attachment to the frame. The large ball seen in the top left corner sets in a socket on a cross member of the frame and gives complete freedom of movement to the transmission assembly. Behind the gearset proper is a case which incloses the speedometer driving gear, and this forms the torque tube head. A disconnectable coupling links the gear shaft to the propeller shaft. Taper pins in taper sockets are used for the attachment of the stay rods which triangulate the axle and gearset assembly.

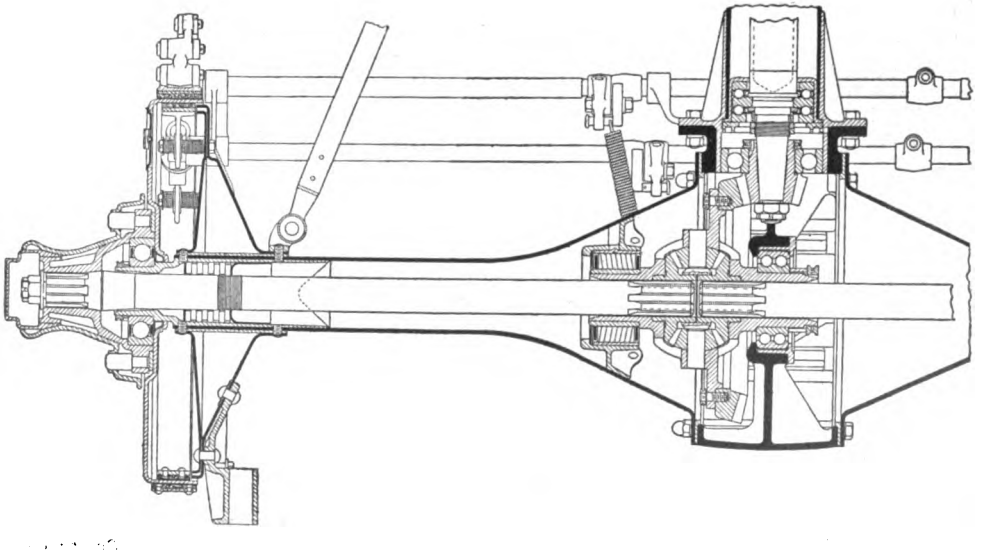




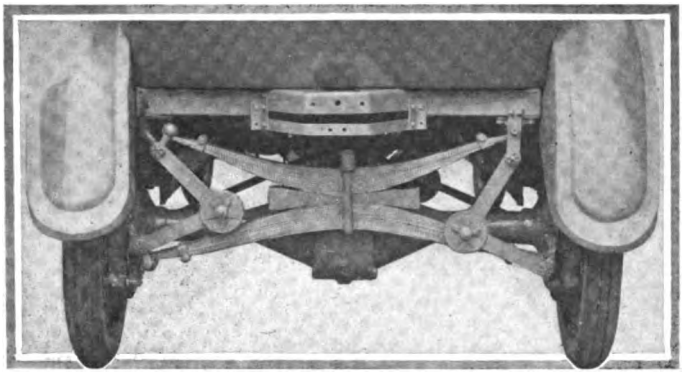
The Marmon clutch is an aluminum cone with spring cushion inserts in the flywheel rim. One of these appears at the top in this cut. In the center of the clutch shaft are the withdrawal collars, which also make the clutch brake



The front axle swivel on the Marmon is absolutely waterproof and once filled with oil it cannot escape. The weight is taken by the three collars which, being in a perpetual oil bath, move with very little friction



The differential case of the Marmon is an aluminum casting strongly webbed and ribbed. The sleeves are of thin, cold drawn steel tubes, the end pieces being put in afterward. It is a light but very strong construction



Marmon rear spring suspension

ing the spring, stiffens it in proportion to the violence of the shock. The natural expectation, however, would be that a car so equipped would be liable to roll, while in actual fact there are few cars so innocent of this fault. The explanation is that one spring being shorter than the other their periods are different and one damps out the other, which action is intensified by the effect of the wood separator.

To test this springing the writer drove the car over moderate gravel and dirt roads at speeds from 10 to 50 m.p.h. with a single 140 lb. passenger in the rear seat and no bump was sufficiently severe to separate him from the cushion. This is a rough test only, of course, but it is fairly severe.

Very Easy Steering

Even in the front axle there is novelty, and a very important novelty too, since it is a feature which improves the ease of steering and renders the improvement lasting. This is the construction of the swivel, which is absolutely waterproof and oil retaining. The swivel axle is shaped like an inverted L and the downward projecting vertical part has three integral collars turned upon it. A split bronze bushing, turned to fit the collars is then put on the spindle and pushed into the bored end of the axle forging, a large cap, something like a hub cap, is then screwed on the bottom of the split bush and locked firmly to the axle, so the swivel pin thus stands in a cylindrical container with no opening save a narrow crack at the top. This is closed by a protecting washer and the pin is drilled to hold oil which is put in through a plug in the extreme top. Since the oil cannot escape it requires replenishment at long intervals only, and the three collars provide a thrust bearing of so large an area that the pressure per square inch is low and movement consequently easy. The design is stronger than the ordinary forged axle as well as being neater and far more effective.

To mention a few other details briefly must suffice, though it would be possible to treble the length of this description. The body, the construction of which has already been described, has a unique feature in that the upholstery is all detachable, being made up in separate units, so in an hour a complete change in upholstery can be made. The finish is of an even better class than that hitherto provided on Marmon cars and the very high sides give extreme comfort. As to the appearance the illustrations are the best criterion.

It is a high-sided type, with a high hood and, if it is necessary to classify it, would belong somewhat to the Italian school of automobile engineering. The folding seats of the seven-passenger model close into a cabinet as shown in one of the illustrations and the body *looks* quite massive despite its remarkable lightness.

The car is delightful to handle. Not only does the engine possess that elasticity and smoothness which characterizes the first half dozen cars of the world but every control operates with small effort. On a rough road it is easy to steer with one hand, and then with but a light grip of the wheel. The clutch needs only a little pressure to disengage it and the service brake has leverage enough to pull the car up smartly without more force on the pedal than the average woman could easily supply. Both gearshift and emergency brake levers are positioned so that they can be grasped without moving the body.

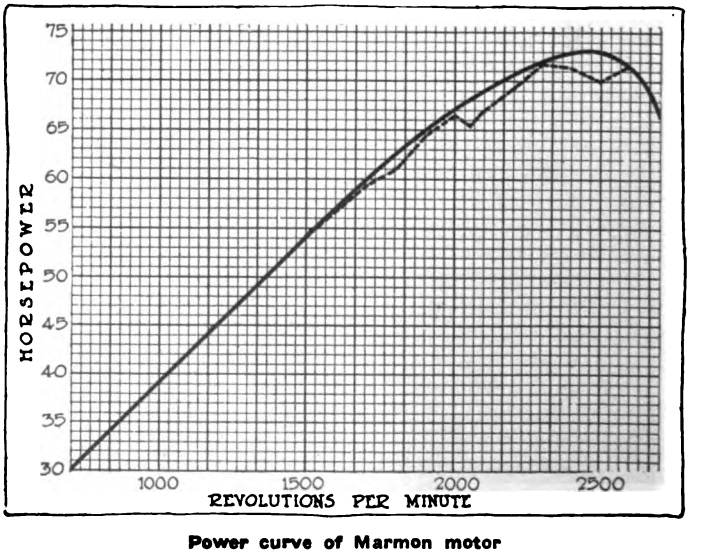
On Indianapolis speedway the mean results of a large number of tests made in both directions on opposite sides of the track showed the following accelerations: From 10 to 20 m.p.h. 3.6 sec., 10 to 30 8.0 sec., 10 to 40 12.4 sec., and 10 to 50 17.6 sec. The half mile was repeatedly covered in several seconds under the half minute. Cornering on the speedway at about 60 m.p.h. there was hardly any roll on the rear springs and the steering operated as easily as on the road at half the speed. Published on this page is the power curve pulled by the engine with which these tests were made about two weeks later, before it had been cleaned out and just as it came from the chassis. In running trim and with supplies, as tested, the weight was just over 3600 lb. but the cars now coming through in regular production are about 100 lb. or more lighter, since there remained a few places where a little more metal could be cut, and this has been done.

In conclusion it is hardly necessary to itemize the equipment which is simply what the buyer of an expensive car expects to get. Tires are 34 by 4½ in. Silvertown cord, the wheelbase 136 in. and the Hartford shock absorbers shown in the illustrations are included. The price for the seven-passenger touring car is $2,750, for the five-passenger touring car, three- or four-passenger "Club" roadster, $2,700.

This new car replaces all previous Marmon models, which are no longer to be manufactured, and since it is so novel a chassis, it should be explained that the design is the product of several years' work. Various of the features which go to make its character have been tested individually, and the complete car has undergone severe trials on road and speedway.

One of the first experimental models was taken right across the continent at an unfavorable time of year, encountering roads in the worst possible state, so the experimenting has been carried out in as thorough a manner as could be desired.

The car has been ready in its final form for several months, the manufacturers desiring to be able to commence deliveries practically as soon as the announcement was made; actually it has been in production for many weeks and some parts were coming through the Marmon machine shops as long ago as September. The car will, like other Marmons, be built entirely in the company's plant at Indianapolis, which has recently been enlarged and rearranged to suit a single model program, and the whole organization is prepared for an output considerably in excess of that of any previous model Marmon car.



Power curve of Marmon motor

The Rostrum

Requirements of Automobile Lubricants

EDITOR THE AUTOMOBILE:—Kindly tell me the necessary qualities for an oil of the first grade to meet the demands of modern high speed racing cars with forced feed lubrication, such as were used in the Indianapolis and Sheepshead Bay record smashing races? As I am interested in getting at the undeniable facts concerning the class of oils that are proving their superiority by the results in actual service of both special racing creations and modern fine motor cars for touring, I would appreciate your telling me whether Castor, Pennsylvania, Oklahoma, or Texas oils are showing any indications of individual qualifications that will be really more desirable?

1—According to the best modern experience and available data, what oil specifications of viscosity, gravity, flash, fire, cold test, and carbon residue are considered essential to an oil of the very first quality and grade for modern touring car motors, such as the Pierce, Packard, Stearns-Knight, Locomobile, National, Mercer, Chalmers, Jeffery and Hudson?

2—Do the race drivers use Castor oil exclusively in their high-speed motors with forced feed lubrication?

3—Is the castor oil compounded with any other kind of oil?

4—If it is compounded, what kind of an oil is used and what are the proportions used? Pennsylvania, Oklahoma or Texas oils?

5—Is a straight Pennsylvania oil used?

6—What are the preferred brands generally used?

7—Can you give me the viscosity, gravity, flash, fire, cold test, and carbon residue of four or five of the best oils?

8—Is a Pennsylvania oil used that is compounded with any other oil?

9—Do any of the race drivers use Oklahoma, Illinois or Texas oils?

10—Can you tell me whether such oils are ever compounded with Pennsylvania oils for the demands of the drivers?

11—Do any of the great race drivers mix an oil of one brand with another oil of lighter or heavier body to get an oil that they seem to be better satisfied with? If so, can you tell me what improvement they strive for? The results they desire might be better secured by making an oil to meet their special requirements.

Warren, Pa. J. L. S.

—It is generally accepted that an oil for use in the oiling system of modern automobiles should have a high flash point so that it will remain a lubricant and resist blackening and deterioration for the longest possible period. An oil of low flash will blacken, deteriorate and thin out quickly, losing its lubricating properties and consequently the oiling system will need to be cleaned out and replenished with fresh oil much oftener than it would be when a high flash long wearing oil is used. The requirements of different cars vary materially as motors having large bearing surfaces require different oils as far as body is concerned from those which have other areas of bearing surface.

According to oil manufacturers an oil for use on cars which have large bearing surfaces, like the Packard, for instance, should be light bodied and have a viscosity of 175 to 210 Saybolt, to work best. On cars such as the Pierce, Locomobile, Chalmers, Jeffery and Hudson a medium-bodied oil at about 250 deg. is very satisfactory. On cars like the Stearns-Knight, National and Mercer a heavy-bodied oil of about 325 deg. viscosity is most satisfactory.

In general cars which are habitually driven at a higher rate of speed should use a heavier-bodied oil than the same cars driven at lower speeds. For fast driving an oil should have a heavy body and a high flash test in order to withstand the more severe conditions.

Authorities state that gravity is immaterial except as it indicates the grade of crude from which the oil is produced. Pennsylvania oils are generally accepted as desirable for automobile lubrication and they are of high gravity.

Low cold test is not so essential in present systems although it is desirable to have the cold test as low as possible consistent with a high flash test. In other words, it is not considered desirable to sacrifice a good flash test in order to secure an abnormally low cold test. In present day lubricating systems, an oil with a cold test of 25 deg. Fahr. should be satisfactory.

2—Very few racing drivers use pure castor oil. In the big races there have not been more than one or two drivers in each instance.

3—Nowadays, if castor oil is used it is not compounded but in former years it was some times mixed with alcohol. It may be that some drivers are using a mixing process of their own which is privately kept to themselves.

4—Some of the oil companies are compounding castor oil with mineral oil, for instance Crystal Oilzum, which is used by a great many drivers is compounded by a special process of castor oil and Oilzum, mineral gas engine cylinder oil. In this case, the mineral oil used is straight Pennsylvania.

5—Yes.

6—The brands of oil used in each race can be determined by referring to the issue of THE AUTOMOBILE following each race of any importance. In this issue there is given in each instance an equipment table which mentions the brand of oil.

7—This is entirely dependent upon the car for which the oil is used and what would be a good oil for one car might be a poor one for another owing to the different areas of bearing surface and the different systems of lubrication. A few examples of what companies are using or recommending for their cars might be of interest. The Hudson Motor Car Co., uses at the present time a heavy Polarine for summer and a light Polarine for winter. The properties of these two oils are as follows:

Properties	*Light Polarine*	*Heavy Polarine*
Gravity	.901	.907
Flash Point	373°F.	385°F.
Fire Test	420°F.	437°F.
Cold Test	–2°F.	–4°F.
Viscosity (70° F.)	242.5	529.4
(Tagliabue) 212°F.	86.2	93.6

The Packard Twin Six instructions state that the oil best adapted for this car is light in color and has the following properties:

Gravity, Baumé, 28.5 to 29.5.
Viscosity at 100° F. Saybolt, 285 to 300.
Flash Deg. F. 430 to 450.
Fire Deg. F. 495 to 500.

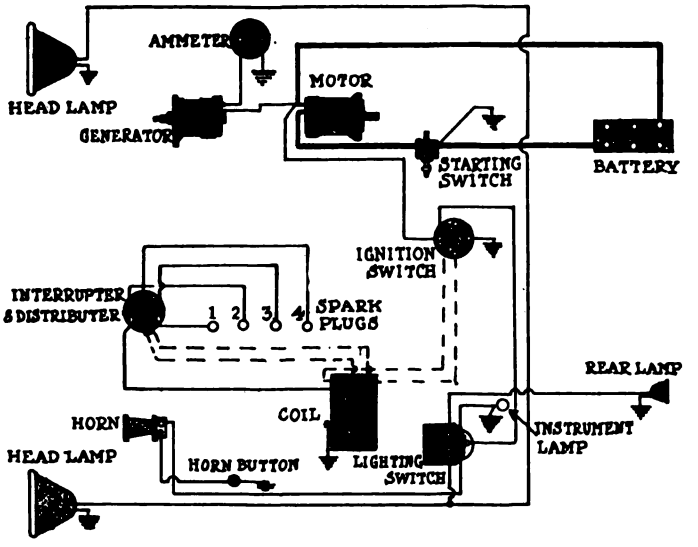


Fig. 1—Wiring diagram of Bijur lighting and starting system on 1916 Model N Hupmobile, showing ammeter installation between generator and ground

The Chalmers concern state that the viscosity for their cars Tagliabue at 70 deg. Fahr. should not be below 220, Gravity at 60 deg. Fahr., not below 29 Baumé. Flash not below 400 deg. Fahr., cold test not over 20 deg. Fahr. A large number of concerns specify a brand of oil which is marketed under the name A and B according to the grade. These properties are as follows:

Properties	*A*	*B*
Gravity	24.5	26.5
Flash Point	415	520
Fire Test	280	590
Cold Test	40	42
Viscosity (104°F.	307	1306
210°F.	49	125

8—Yes, this is done.

9—We have no record of any drivers who do this.

10—There does not seem to be any object of doing this as this would reduce the flash test and an extremely high flash test is necessary where an oil is used for racing purposes.

11—We do not know of any drivers who mix an oil of one brand with another of lighter or heavier body. In such oils as Crystal Oilzum the compounding is done to make an oil that will be faster than pure castor oil.

Mounting Ammeter on 1915 Hupmobile

Editor THE AUTOMOBILE:—Kindly give me full instructions for installing and connecting an ammeter on a present model Hupmobile equipped with the Bijur lighting and starting system, also on the earlier model equipped with the Westinghouse system. In addition, I would like to obtain the same information regarding the present model Chandler equipped with the Gray & Davis system and the earlier model having the Westinghouse system.

East Orange, N. J. G. L. C.

—The diagram which will give you full instructions for installing and connecting an ammeter on the Hupmobile is shown in Fig. 2. The diagram in Fig. 1 applies to the Chandler and Hupmobile with the Westinghouse system. An ammeter to be used in these circuits should be of the double-reading type with zero in the middle of the scale and about 20 or 30 amp. each way from zero. It is usual to mount such an instrument on the dash, but of course the position of mounting depends entirely on your desires.

On the Chandler model with the Gray & Davis equipment the ammeter should be connected in the circuit between the terminals B at the regulator cutout on top of the motor generator and the battery, but to avoid the cutting and splicing of wires, it is advised that the wire be disconnected from terminal B at the regulator cutout and connected to one terminal of the ammeter. From the other terminal of the ammeter a wire of the same size should be connected to terminal B at the regulator cutout. When the engine is at rest, light turned on, the ammeter should indicate discharge, the amount used by the lamps. If charge instead of discharge regulations are shown, reverse the ammeter connection.

The Bijur company states that in installing the ammeter in the generator circuit of the 1916 model N Hupmobile with Bijur lighting and starting, the proper way to connect it is between the generator and the generator ground terminal as shown in Fig. 1. Connecting the meter between the generator terminal and one of the motor terminals will produce the same results. Connecting it in the grounded side is simply an easier installing proposition. Connecting the meter in either one of the generator leads will cause it to show generator output only and the meter needle will stand at 0 when the car is at rest regardless whether or not the lights are in use. In other words, the meter indicates only when the engine is running and does not show charge and discharge.

Construction of High-Tension Coil

Editor THE AUTOMOBILE:—In your issue for Nov. 18, the first letter in your Rostrum is one from Mr. Allen, asking among other things several questions with regard to the spark coil. Inasmuch as all ignition, even the high-tension magneto, uses the principle of the spark coil, if not the coil itself, will you permit me to answer somewhat more fully Mr. Allen's question?

The distance that a spark will jump depends, as he suggests, on the ratio of the turns in the two windings and the voltage of the current. The higher the voltage and the greater the difference in the number of turns between the primary and secondary windings, the longer the spark. A spark, however, may be too thin, and this depends in part on the size of the secondary wire, which ordinarily should be Brown & Sharpe, No. 36. It also depends on the adjustment of the vibrator, which may be adjusted so as to permit too small an amperage of current to flow. In a negative way it also depends on the capacity of the core and on the capacity of the condenser—but this only in the sense that if there is an insufficiency on the part of either of these the spark will be under its normal size.

Makeup of the Coil

I assume that your readers all are aware of the general makeup of the coil, which consists of a bundle of soft iron wire in the center, which increases the intensity of the coil action, the winding of two or three layers of coarse primary wire over the core and then outside of the primary wire the winding of many turns of fine wire, forming the secondary wiring, and finally a number of layers of tin foil, alternating with parafine paper, and connected alternately and forming a reservoir to take up the electric current when it is broken by the vibrator or other interrupter.

In the first place the sizes of wire used in coils depends upon the number of amperes intended to be carried by the coil. The secondary wire is Brown & Sharpe, No. 36, and that is true if the spark coil is for a ¼-in. spark or one a foot long. The primary wire for the smaller sparks is No. 16. For larger sparks the wire size runs down to No. 10 for a 12-in. spark. The weight of primary wire used does not increase in proportion to the length of the spark but on a very much smaller scale. Six ounces are said to be enough for a ½-in. spark, while seven times that is used for a spark twenty-four times as long.

Inasmuch as the larger coil has heavier wire wound on a larger core, it indicates that there are comparatively few additional turns of wire in the makeup of the instrument. The weight of the secondary wire increases about in propor-

tion to the length of the spark, being for a ½-in. spark the size used in automobile work about ¾ lb.

It is optional to use a slightly heavier wire in the secondary winding, which will result in a shorter and thicker spark, or to use a slightly finer wire, which will result in a longer and thinner spark.

I believe I am correct in saying that the length of the spark for any particular coil depends on the voltage in the primary winding, while the thickness of it depends, within limits, on the amperage in the primary winding. Of course when a spark is not required to jump its full limit of distance, it becomes thicker and more flaming in character.

A spark coil may be used with an excessive voltage, but if so, it will probably ultimately break down by the spark penetrating the insulating layers in the secondary coil, in which case the coil is useless and quite beyond repair.

The condenser sheets of tin foil for a ½-in. spark consist of forty sheets of 3 by 4 in. In the larger sparks the sheets may number as many as sixty and increase in size so as to be about in proportion to the increased length of the spark.

Disadvantage of Too Hot a Spark

A very hot spark increases the strength of the explosion in the cylinder. On the other hand it eats away rapidly the electrodes of the spark plug. It is poor economy to endeavor to save a little in electric current by reducing the amperage to a minimum by manipulating the adjustment of the vibrator. It is true that one can get along with a minimum of current, but in doing so he is losing the energy which the explosion mixture would otherwise be capable of giving.

The voltage in a secondary winding for a ½-in. spark is about 10,000 and, very roughly, proportionately larger or smaller for other lengths of sparks. This, of course, does not mean that the voltage of every coil used is 10,000. It may be less or more according to the number of dry cells or batteries used in the series.

While the voltage is so high, the amperage is proportionately small, being a mere trace of current, for what the voltage gains the amperage loses. For example, if the current in the primary is five volts at 2 amp., this equals 10 watts, and if the voltage in the secondary is 10,000 the amperage is but 1/1000 part of 1 amp.

Aside from injury, due to the breaking down of the insulation in the secondary wiring, there is sometimes an injury due to a break in the condenser. This last difficulty is evidenced by excessive sparking at the vibrator. The only other difficulty to be found is the pitting of the contact points. This can be avoided if the direction of the current is changed occasionally. In many instances this is quite practicable, although not so in all. Reversing the current causes the deposit on the contacts to be reversed and to be put back where it came from.

In very rare instances and in some forms of vibrators the filings from the contact points dropping down may form a short circuit if not brushed away.

Aside from the adjustment of the contact points and the refacing of them when pitted, nothing can be done with a coil except send it back to the factory, if it is out of order. It is quite impossible to reach or repair either the condenser or the secondary wiring.

Spark at Breaking of Contact

It should also always be borne in mind that there is practically no spark at the moment of contact. The only spark worth speaking of takes place at the breaking of the contact. The reason of this is extremely simple. The induced current when contact is made is in the reverse direction to the inducing current and as every winding of the primary wire acts on every adjoining winding, to induce a current opposite to the main current which is flowing in the wire, it is easy to be seen that the current is much reduced in strength, and the same thing takes place in the secondary wiring, so that while there is a small spark it is not of a character to be useful in ignition. Its presence is witnessed by the forms of some of the parts in magneto work, the intent being to avoid the possibility of an explosion due to this unused spark, but even in this work I believe the spark has come to be disregarded.

There are two small booklets, published by Spon & Chamberlain, No. 123 Liberty Street, New York, at 25 cents each. One of these is Induction Coils, edited by Stoye, on the making of such coils, and the other contains a number of experiments possible with an induction coil, most of which I have tried and found very entertaining. It is entitled Experimenting with Induction Coils, by Norrie.

It should be well understood that even a ½-in. coil is utterly unsuited for practical jokes and the current actually dangerous to some individuals.

New York City. CHARLES E. MANIERRE.

Analyzes Gnome Rotary Cylinder Motor

Editor THE AUTOMOBILE:—I noticed in the Nov. 11 issue of THE AUTOMOBILE a criticism of an article on the Gnome rotary cylinder aeroplane engine. In this article Mr. Hartford says that the engine in question is also a reciprocating motor insofar that the pistons reciprocate in the cylinders. So far he is right, but he has failed to analyze further. The relative movement of the pistons and the cylinders is one of reciprocation, but the actual movement is rotary around a given center.

The cylinders revolve uniformly around the center of the crankshaft. The pistons revolve around the center of the crankpin. Owing to the design of the connecting-rods in the Gnome motor, the pistons do not revolve with a uniform speed exactly but in several other motors this difficulty has been overcome.

Mr. Hartford has fallen into the error of many in not appreciating the difference between relative and actual motion.

Of course, all motion is relative, but a discussion could be carried on regarding this forever and never prove anything. In the ordinary type of stationary cylinder engines, the main stresses are those of inertia; in the revolving type, the centrifugal stresses are the highest.

One pound of weight at 1 ft. from the center revolving at 1100 r.p.m., produces a centrifugal pressure of 412.6 lb.

San Francisco, Cal. A. F. B.

Sign Your Inquiries

The Rostrum is in receipt of a number of inquiries which are either unsigned or signed by initials only. All letters to be answered by this department must bear the signature of the sender as an evidence of good faith.

The History of the American Automobile Industry—9

Modern Regime in Steam Construction from 1898 to 1906—Griffiths Recognition of Necessity for Comfort—Gordon's Squirrel Type—Four-Wheel Drive in 1824—Engine on Each Wheel

By David Beecroft

IN the previous eight chapters of this history has been told the early story of steam automobiles in the old world; and their origin has been traced in America from 1743, when John Fitch did his first work at Camden, N. J., up to 1890, when the pioneering work of R. E. Olds, present head of the Reo company, was outlined.

The Modern Regime

The next step in steam development in America was the modern regime dating from 1898 up to 1906, a time when over fifty American makers were building steam automobiles in great quantities and when steam led gasoline. Before taking up this last period it is necessary to devote a few chapters to a review of the most important steam development carried on in Europe from 1825 on, for 50 years, a period in which people were riding over the highways in steam coaches much as our gasoline buses cover rural routes to-day, only not with by any manner of means the same speed or comfort.

It is necessary for a correct interpretation of the steam vehicle of a few years ago, which is still green in the memory of thousands living, to go back over those 50 years and see how many problems they solved, and give them credit for what they accomplished, thereby seeing in a truer perspective the work of our own pioneers of to-day, who were responsible for the steam regime beginning in 1898.

Chronological Recapitulation

Let us briefly recapitulate the progress of steam abroad to freshen our memories with the activities of the pioneers:

In 1698 Thomas Savery, a Briton, built the first steam engine known, not in any sense an engine as we know it to-day, but a steam pump for lifting water.

In 1705 Thomas Newcomen, a Scotchman, revamped the Savery engine and made it practical enough to be the ideal steam engine for 60 years, until James Watt took it up, improved it and gave us the principles of steam as we know them to-day. Newcomen's engine was the recognized engine of the day, all others were imitations of it.

In 1769 James Watt, the Scotch engineer, added the necessary separate condenser, which was what the engine lacked, and that very year the steam engine was used to drive a vehicle.

In 1769 Joseph Cugnot, the French engineer, built the first automobile. He could not do it until Watt made the steam engine practical enough.

In 1770 Cugnot made a steam automobile that hauled 2.5 tons 3 m.p.h. and this vehicle is still preserved in the form of a model in France.

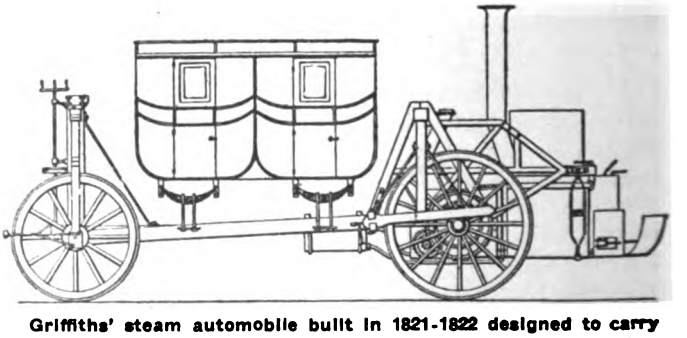
In 1802 the first practical steam automobile was built, Richard Trevithick, England, using a crankshaft for the first time and driving by gears from the engine to the road wheels.

In 1821 Julius Griffiths, England, gave us the first comfortable steam vehicle, the first vehicle to have a coach design of body with seats carried on springs as we know them to-day.

Thus was the growth of steam up to the practical, comfortable age that we must cover before completing the 1898 regime in America.

Griffiths' Semi-Elliptic Springs

Julius Griffiths was a literary man and traveler, not an engineer, which accounts for his developing a comfortable vehicle rather than working on the engineering end. He might be considered a real pioneer of the maker of to-day, who must essentially provide a comfortable vehicle. His steam automobile, built in 1821-22, was patented in several countries and designed to carry 3 tons of merchandise or a dozen passengers at 5 m.p.h. It had semi-elliptic springs under the body and the mechanism was also spring-mounted. The boiler and firebox were behind the rear axle leaving much space for passengers or goods ahead. It was built by Bramah, the leading engineer of that day. Horizontal water tubes were in the boiler, but be-



Griffiths' steam automobile built in 1821-1822 designed to carry 3 tons of merchandise or twelve passengers at 5 m.p.h. Comfort was a feature of the construction

ing small, burned out, because water could not get into them fast enough. The engine was a two-cylinder one and exhausted into a condenser cooled by air, this condenser consisting of thin flattened tubes much as some modern ones have been made. This vehicle was a failure in practical use, but stands foremost as the pioneer of the passenger automobile of to-day.

The Squirrel Steamer

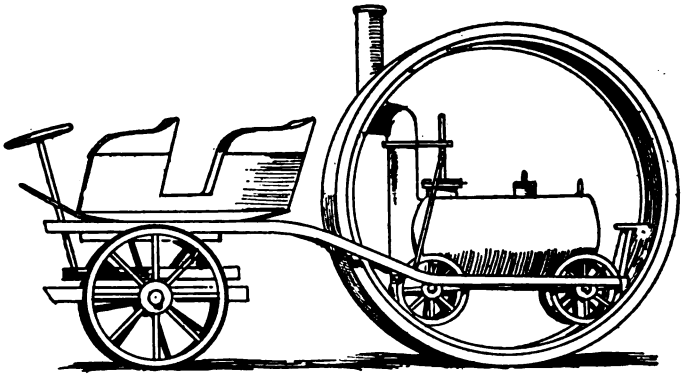
At about the same time David Gordon of England undertook a very novel plan for vehicle propulsion. His engine was mounted inside a large wide wheel, and tended to climb the wheel as a squirrel climbs up its revolving cage, the weight of the engine therefore became the propelling power, and this wheel attached behind the vehicle pushed the vehicle as it rolled. The small engine was placed inside a metal drum, serving as a wheel. This drum was 9 ft. in diameter and 5 ft. long, the smokestack being elbowed to rise at one end of the drum. The small wheels on the steam engine had teeth that meshed into two rings of internal teeth on the inside of the drum.

A Later Construction

Not succeeding in his first novel attempt at steam propulsion, Gordon began exploiting along a different line, and in 1824 obtained a patent in which pushers were the propelling means. This had the steam cylinders, two in number, in the front, horizontally placed on trunnions so that they oscillated and drove a crankshaft having eight throws. The extra six throws, three on each side, were fitted with pushing legs, having feet of considerable area so as to get a considerable grip on the ground. These feet were fitted with bristles of whalebone, which made the contact on the ground less noisy and destructive than a metal surface, but they were also fitted with metal spikes in case the load was more than the bristles could carry. These pushers were between the axles and pressed against the ground at an angle of nearly 45 deg. To stop propulsion these pushers could be lifted by ropes attached to them for this purpose and in turning a corner those on the inside could be lifted, leaving the outer ones to do the work. It worked successfully, though somewhat jerkily, but without sufficient engine power to permit much speed. Similar pushers were afterward fitted.

Four-Wheel-Drive 1824

In this same year—1824—two Scotchmen, Burstall and Hill, worked on a coach having a two-cylinder engine with boiler at the rear and with connecting rods from the walking beams direct to cranks on the axle. The particular feature was the use of two sets of bevel gears and a lengthwise propeller shaft by which the front axle was compelled to drive the rear one. All four wheels were loose on the axle, but connected by pawls and ratchets so they could drive on the straights but allow the outer ones to overrun in turning corners. In this we had the first record of a four-wheel-drive vehicle, a design so much in the public eye in



Gordon's squirrel steamer in which the engine was mounted inside a large wheel and tended to climb the wheel as a squirrel climbs in its revolving cage, the weight of the engine becoming the propelling power and pushing the vehicle as indicated by the illustration

truck work to-day, especially in the arduous service of war.

But there were many more of our so-called modern constructions in use in those days when Waterloo was as fresh in the memory as Warsaw is to-day. In 1825 H. Peto made a steam coach fitted with a two-speed gear, the pioneer of the gearbox of to-day. The automobile was a very light type, also an object of attainment to-day, but was not used much.

In 1827 James Nasmyth, the steam-hammer man, made both a model and full-sized carriage for eight passengers, but after a few months' experience this was broken up. Other experimenters of less importance were also working.

Engine for Each Wheel

W. H. James, England, turned his attention to this subject in 1824, but lacking capital accomplished little until he interested Sir J. Anderson as a partner. His car used a water-tube boiler carrying high pressure, with a separate engine for each driving wheel and with the valves connected to the steering gear in such a manner that more steam was given to the outer wheel in turning a curve. Here was another substitute for the modern differential. This carriage is said to have run over a rough gravel road at the rate of 12 to 15 m.p.h. in 1829. It carried fifteen passengers, was quite tasteful in design, and weighed over 3 tons. A second carriage was soon built having oscillating engines and the feed water heated by the exhaust. Financial difficulties stopped the work, however, which Anderson took up with a new boiler some 9 years later, forming a carriage and wagon company and building a number of vehicles in Dublin and Manchester in 1839 and 1840.

The idea of placing a separate motor on each drive wheel has been tried by several automobile concerns within the last 15 years. There are several electric commercial vehicles using it; and only 5 years ago the Daimler company in England built a gasoline-electric bus for London streets with a separate four-cylinder gasoline engine driving to each rear wheel. The individual drive idea is nearly a century old, and not an innovation of the twentieth century.

Testing Spring Suspension and Dampers

CAREFUL work is now being carried on in the industry with a view to the eventual perfecting of the spring suspension for automobiles and motor trucks. During the past four years considerable attention has been given to this subject in THE AUTOMOBILE, partly in the department entitled Engineering Digest (which, being based mainly upon technical articles appearing in the French and German periodicals, ceased to receive nourishment and began to languish when the engineers of Europe became absorbed in war problems) and partly in original articles. As an example showing how this material is followed up long after its publication, as well as the nature of the questions which arise, there is printed herewith a letter from one of the research engineers of a leading manufacturer of Detroit, and the appended answer may meet the requirements of other investigators. The letter reads in substance as follows:

Editor THE AUTOMOBILE.—I have just been reading an article in THE AUTOMOBILE, issue of June 25, 1914, page 1336, wherein mention is made of the published accounts of experiments with vehicle suspension by Lanchester in England and Bobeth in Germany. I would greatly appreciate information from you as to the names of these publications and where they can be procured.

In another article published in THE AUTOMOBILE, issue of December 18, 1914, mention is made of a recording device perfected by Dr. Bobeth. I am particularly interested in this recording device, and if you can give me any information regarding it, or tell me where I can procure information, I shall greatly appreciate it.

Detroit, Dec. 11, 1915. (Signature)

Die Leistungsverluste und die Abfederung von Kraftfahrzeugen by Dr.-Ing. Erich Bobeth was published in 1913 by M. Krayn, Berlin W. 57, Germany, and can be obtained from him or by order through any book firm dealing in European books. The accounts of the Lanchester experiments were referred to from memory and have not yet been relocated. The recording device used by Bobeth to determine the damping effect of the friction between spring leaves and that of special auxiliary dampers or shock absorbers was used in connection with the same author's arrangement for measuring and recording the shocks due to inequalities of the road surface, and to make its operation clear this arrangement must first be described.

Fig. 1 shows a rear and a side view, it being understood that the road is represented by rotatable sheaves on which projecting blocks with a rounded surface are fastened in such manner that they fall off the sheaves after impact with the wheels, so that the impact is not repeated at each revolution. Two pairs of angle irons AA are laid across the pit containing the sheaves, in the direction of the vehicle, and recesses are machined into these angle irons to afford a firm track for two sliding rails BB which are smoothly planed and on their upper face carry the long glass strips DD standing on edge and on the under side the racks CC which mesh with spur pinions EE. These pinions E on both sides are mounted on a common shaft F which is driven by sprocket chain G from the shaft H of the sheaves. A coupling J permits the release of the connection with shaft H [which is termed the brake shaft by the author, as the sheaves are used for brake tests also].

With the coupling in action the rotation of the sheaves, caused by the vehicle wheels, is transmitted to the spur pinions E, and these drive through the racks CC the rails BB with the glass strips. Their rate of movement is thus determined by the gear ratio when the revolutions per second of the brake shaft are counted. The glass strips are coated with lampblack, and the styluses K and K1, on each side, are connected with the axle and the vehicle frame, respectively, and arranged to press elastically against the glass, so that oscillations of the axle and of the frame are inscribed automatically in sharp lines in the lampblack, the ordinates representing the amplitude of the oscillations, without reduction, and the abscisse the time elapsed during oscillations on a scale depending upon the gear ratio of the drive and the speed of the brake shaft. Changes in the gear ratio (indicated in Fig. 1 by an auxiliary set of sprocket wheels) admit of getting a suitable time scale for any chosen vehicle speed. [It may be noticed in the side view of Fig. 1 that stylus K which records the axle movements and stylus K1 which records the frame movements are not shown as starting from the same ordinate on the glass strip, and it would seem that either this variation must be notably smaller in practice than it appears in the drawing or else an allowance must be made for it in transcribing the oscillation curves from the glass strip, at least when the question is that of determining accurately the time sequence of axle and frame oscillations.]

Device for Recording Damping Effects

The arrangement used for obtaining numerical values for the forces tending to reduce the amplitude of oscillations is shown in Figs. 2 and 3. The friction between spring leaves is usually considered the most important among these forces, but measurement shows that it represents only one-fourth to

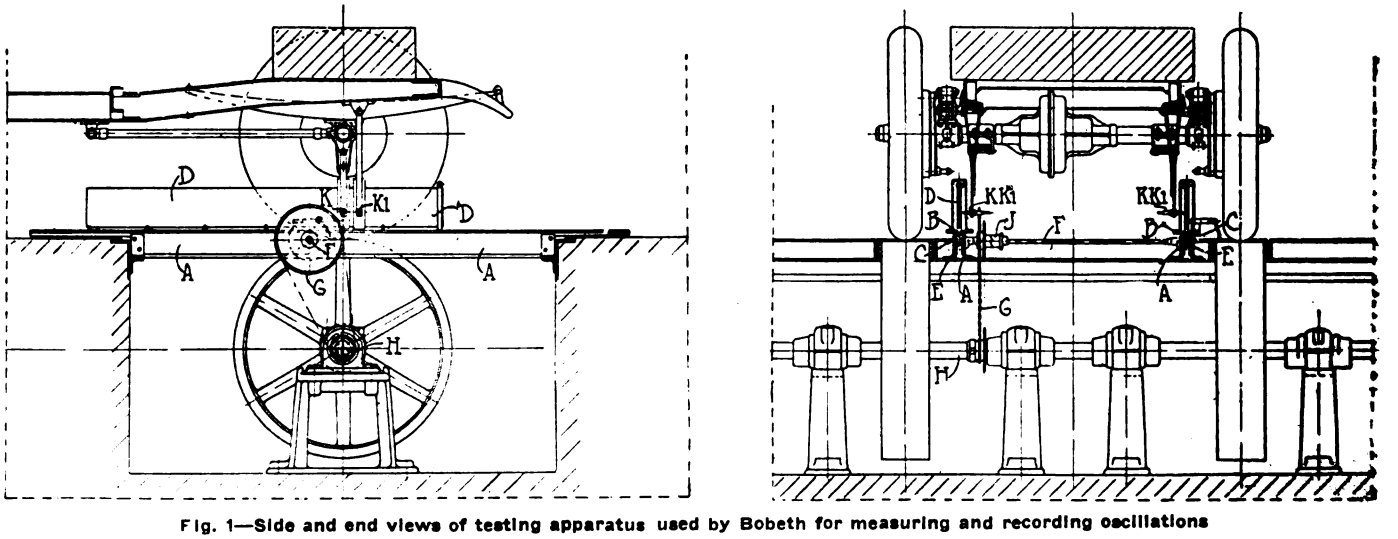


Fig. 1—Side and end views of testing apparatus used by Bobeth for measuring and recording oscillations

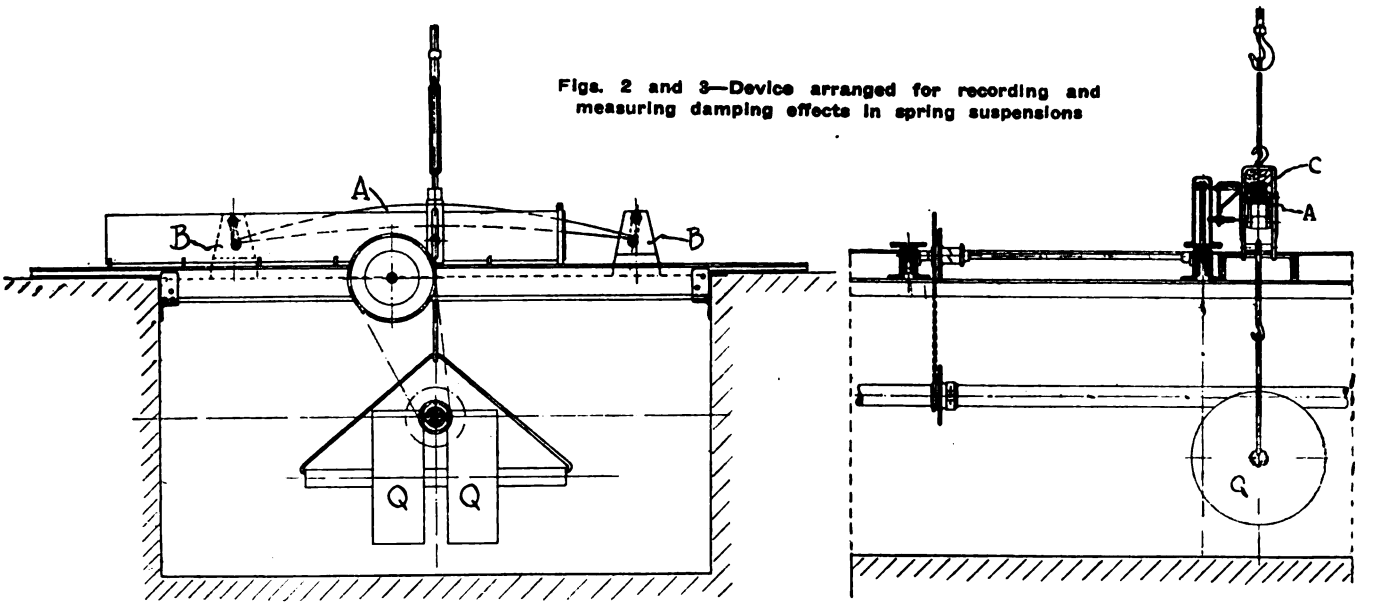


Figs. 2 and 3—Device arranged for recording and measuring damping effects in spring suspensions

one-third of the total damping effect produced by various resistances arising when the vehicle springs are oscillating. The movements of spring shackles and bolts as well as of torsion rods and chain adjustment stays cause more or less friction, and the changes in the angle of the power transmission, by way of the universal joints, taking place whenever the relation of axle to frame is changed by spring oscillation always operate in both directions against the oscillations which cause them, the forces required for the acceleration and retardation of the moving parts depending largely upon the rapidity of the oscillations with which they must keep time, and these are not the spring oscillations but the relative oscillations of frame and axle. These relative oscillations are very variable and at times of much higher rapidity than the spring and axle oscillations [as shown in Fig. 10, page 197 in THE AUTOMOBILE for January 28, 1915], causing correspondingly high resistances and frequently, as in case of chughole effects, bringing the spring oscillations to a much quicker stop than would be expected from their amplitude.

The spring A is hung with its shackles, in the same manner as for static determinations of leaf spring forces, in the two supports BB. Over the middle of the spring there is placed a sheet iron bow C loosely inclosing the spring leaves and fitted with a hook at the top and another at the bottom. From the lower hook there is hung a weight Q, causing a deflection of the spring. By means of the upper hook the bow strap with its load may be raised, so as to relieve the spring completely.

In order to be able to use the apparatus shown in Fig. 1 in connection with this device for the recording of the oscillations of the spring, the latter is brought into elastically maintained contact with the blackened glass strip by means of a stylus secured to the bow strap.

Tests were made by pulling the bow strap up so high that the spring was entirely relieved of load while still maintaining contact between them. By a sharp stroke the cord by which the bow strap was held up was then cut, so that the load Q had to be carried by the previously unloaded spring alone. The spring began to oscillate and, as the glass strip at the same time was moving, the oscillations were recorded on it.

In determining the value of the damping factors which bring the oscillations gradually to a stop it was assumed, in the simplest cases, that the resistances during the period of the oscillations were proportionate to their amplitude, so that the relations of the forces are represented in arithmetical progressions. With the force applied to produce the first deflection subject to measurement, the value for the damping forces may be figured from the equation: $2e = a_n - a_{n+1}$, where e is the total damping effect and equals one-half of the difference between the forces represented in two successive oscillations in the progression.

The development in details, as given by Dr. Bobeth, is in the main mathematical upon this foundation, but is supported by a large number of the diagrams obtained from the testing apparatus under different conditions of operation.—M. C. K.

Scientific and Technical Reform

OBSERVING the rapid growth of German industries and trade as well as the efficiency of German war measures many prominent Britons have been strongly moved to urge the speedy reform of traditional British methods. It is especially the science back of the industries upon which attention has been focused. Dr. J. A. Fleming in a lecture before University College, published in *The Engineer* of October 8, dwelled on the need of greater efficiency in all production in order to carry the war debt of 3000 millions sterling now accumulating. Coupling the subject with an explanation of his own scientific and inventive work for the improvement of range-finding and the use of wireless telegraphy in aeroplanes, he urged the revision of school and college plans, to compel more and better work on the part of students, and the energetic extension of co-operative research, both scientific and industrial. The scientific societies should organize and distribute work for definite and formulated problems which are too large and complicated for one man. On the whole Dr. Fleming seemed to acknowledge the superiority of German methods. Different views are represented in the presidential address before the Society of Arts, by Dr. Dugald Clerk, whose services to automobile engineering are widely recognized. The gist of his remarks—which *The Engineer* of November 26 hails as a much needed tonic for every detractor of British progress and British methods—was that "muddling through," as a term supposedly describing the average British method, is a bad misnomer, inasmuch as Britain is still the most successful nation in the world. He spoke of the difference between inductive and deductive methods, ascribing the inductive to England and the deductive to Germany and holding that the inductive or experimental processes for making progress were by far the safest, as shown, for example, by the predicament in which the Germans now find themselves for having presumed to reason out the results of a European war in advance.

Both papers are well worth reading, even though the distinction between "inductive brains" and "deductive brains," as accepted by Clerk, must fail to satisfy all scientists, since all capable persons invariably both "induce" and "deduce."

ACCESSORIES

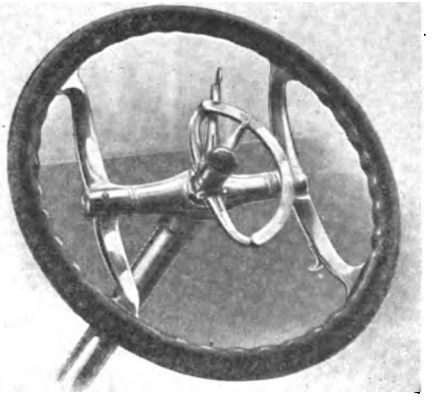
Pouvailsmith Products

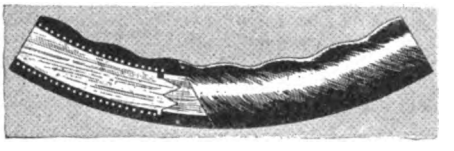
THE Pouvailsmith Corp., the formation of which was announced in THE AUTOMOBILE for Dec. 9, makes a large line of steering wheels, among which a feature is the Warm Hand construction which has been on the market for several years. This device has been greatly improved to conform with modern car design and to meet the demand for a means of keeping the hands warm in winter and on the chilly evenings characteristic of many months of the year. As now manufactured, the Warm Hand wheel consists of a wooden core with the heating coil wound spirally around it and over this is cast condensite under a pressure of 120 tons. All wiring is concealed, coming up the steering column between the rod and casing, while an ingenious commutator replaces the ordinary bushing at the top of the steering column, insuring constant electrical connection and preventing any twisting of the wires. Two quadrants of the wheel are heated, where the hands naturally fall on the rim in steering. A simple push switch is used to throw the current on and off, the red end of the button switching it off while the black turns it on. The current consumed is negligible and the device is made for cars with electrical systems of any voltage.

The Warm Hand wheels, as well as the ordinary types manufactured by the corporation, are furnished in folding form if desired. The folding wheels pivot on the diametrical crossbar, being firmly locked in place except when folded. A trigger-type lock operated by the forefinger renders manipulation easy. A button switch is provided for operating the horn.

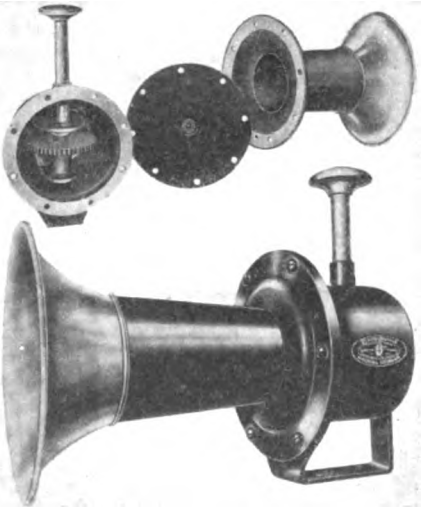
The 18-in. Warm Hand steering wheel (model G) sells for $15 and in the folding design (model H) for $20.

Other products of the corporation are radiator filler caps, gasoline tank filler caps, control lever balls, moulded electrical installation and special composition moulding.—Pouvailsmith Corp., Poughkeepsie, N. Y.





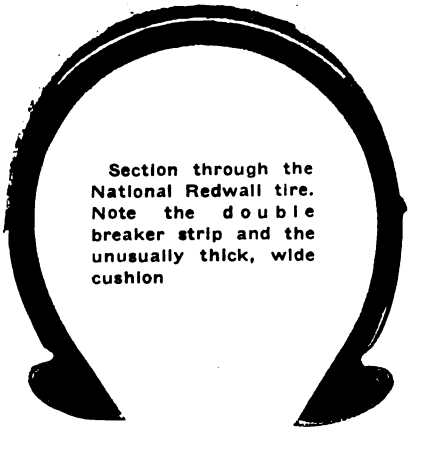
Folding type of Warm Hand steering wheel. Below, the rim construction is illustrated. Note heating coil in section



Evergood hand horn for trucks

Evergood Horn for Trucks

This hand horn operates on the cut gear and spiral principle and is claimed never to stick, the slightest tap on the plunger being sufficient to emit a warning note. In testing this horn it was placed in a power press set to give the exact limit of stroke of the hand plunger and after being operated for approximately 60,000 strokes the horn was disassembled and micrometer measurements taken. This test the manufacturer states to be equal to two years use, the horn being in perfect operating condition at the finish and the wear being less than 1/1000 in. The standard finish of this horn, which is designed throughout for motor truck use, is baked black enamel for the projector and case while the bell and plunger are polished nickel. With a 5½-in. oval bell the price is $4, while the model with 6-in. oval bell lists at $5.—Emil Grossman Mfg. Co., Inc., Brooklyn, N. Y.



Section through the National Redwall tire. Note the double breaker strip and the unusually thick, wide cushion

National Redwall Tire

The Redwall tire, illustrated in section herewith, adheres to standard modern tire construction, the manufacturers claiming no unusual features other than very high grade design, material and workmanship. The tires are built entirely by hand, square woven sea island duck fabric being used with one extra ply, while a double breaker strip is employed. The manufacturers claim that this construction practically eliminates the danger of stone bruises,. The cushion is built unusually thick and wide, extending under the tread down the side wall and well beyond any possible point of traction.

In the regular clincher and quick-detachable clincher styles, a fabric bead is used instead of the customary hard or soft rubber type, the manufacturers claiming that experience has proven the fabric bead to be practically unbreakable, even when the tire is driven flat. In the straight side type the bead consists of many strands of heavy piano wire embedded in fabric. The tread is made extra thick and very tough, the open steam wrapped tread process being used throughout. The red side wall and white tread make the tire's appearance attractive and give it the name Redwall. The tire is made in all types and sizes and with both plain and non-skid treads. It is guaranteed for 5000 miles.—National Rubber Co., Pottstown, Pa.

Indigan Fan Belting

This is a special fan belt stock, and the manufacturer is making a special campaign on belts adaptable particularly to the Ford engine. The new article is called Indigan fan belting, and is made from chrome grain leather. It is claimed by the maker that from the time this leather is started from the green hide the idea has been to produce a piece of material that will meet the conditions under which fan belts operate.

This concern also makes V-shaped fan belts, tire boots, laces for boots and hoods, crank pockets, metal hooks of various kinds, straps and round belting. —National Leather Mfg. Co., Niles, Mich.

1915

PHENOMENAL is approximately the only word that adequately expresses the movement of the automobile industry during the year just closing. It has been a year unequaled in production, a year in which the basic principles of vehicle manufacture have received wider attention than heretofore, several companies rather than a few entering the production field. With some increased production meant self-preservation and with others it meant vastly increased profits. With such increased production, with such simplification of chassis design, prices would naturally be reduced.

While 1915 has been spectacular in results, more cars, simpler cars, better cars and lower prices, the reasons can only be found by analyzing 1914 and 1913. The roots of 1915 are found in the two or three previous years. Production has been facilitated by the standardizing work the S. A. E. has accomplished, and which has been going on for several years. Production has been possible by a greater fulfillment of the simplification in design, a movement which has been under way for three years. Simplification has been possible by better planning of makers, by more attention to motion study in manufacture and by bringing the engineering and production departments together so that a design was not used unless it were possible to incorporate in it sound engineering and easy production.

The Light, Large Car

JUST as the Cadillac eight ushered in an epoch so, it is probable has the new Marmon, in which light weight construction has been studied with such exceptional care. Of course the Marmon is not by any means the lighest seven-passenger car ever built, but it is far lighter than the average car of the class which it represents. It is from 20 to 30 per cent lighter, to descend to actual figures. A cut of between one-fifth and one-third in weight is no small accomplishment and it is difficult to see how it could have been done without the special frame design and the aluminum motor.

Whether this is so or not, there is little doubt but that the Marmon will spur on others to attempt the same result. Light weight is the greatest factor in reducing the expense of upkeep and so is of immense importance to the owner. Except in isolated instances the automobile engineer still has a tendency to disregard the weight of his production, but once his attention is forced upon it we may expect advances as rapid as we have seen before with other engineering problems.

Removing the Glare

MORE impetus must be given the movement of eliminating glaring headlights from our cities and country roads. Much has been done during the past year, but more remains, and what is left to be done must be actively taken up. The glaring headlight is an inexcusable danger on the highway. There is no necessity for it, because very simple anti-glare measures can be adopted by practically all motorists, that will not only eliminate the glare but leave the illumination of the headlight satisfactory so far as picking up objects along the side of the road and also distinguishing objects a sufficient distance ahead of the car.

Two or three States have already laws making the glaring headlight illegal, and other States will enact laws during the coming sessions of their legislatures. The motorists should assist in this rational legislation, using their influence to see that no insane regulations are included and that the law placed on the statute book is a just one. The rational motorist is as much opposed to the glaring headlight as any one. Its elimination is more conducive to safety. What must be avoided is any State placing its mark of approval on any particular type of anti-glare device. Such would be dangerous. It is possible to dim the glare without injuring the useful illumination, and it is to this point that motorists should see that only rational action is taken.

One important matter to be decided in this respect is whether many of the present signal lights incorporated in the headlights are really glare devices or not. The police in some cities are making arrests and imposing nominal fines on these signal lights, and at a recent demonstration of anti-glare devices in an eastern State it was the general feeling that several of these are really glare types and will have to be legislated against.

Chevrolet to Increase Stock

Financial Rumors Current That General Motors Will Merge with Chevrolet

NEW YORK CITY, Dec. 22—A meeting of the stockholders of the Chevrolet Motor Co. has been called for to-morrow in this city for the purpose of amending the certificate of incorporation of the company by increasing the capital stock and to authorize the issue of such increased capital. In October the Chevrolet capital was increased from $2,500,000 to $20,000,000. This stock is largely held by W. C. Durant and his associates, Durant being the organizer and dominating spirit in the Chevrolet organization.

It is rumored in financial circles that the increase of stock to be arranged for to-morrow is a step in a large movement to merge the General Motors Co. with the Chevrolet Motor Co. It is known that Mr. Durant and his associates representing the Du Pont powder and Remington arms interests has during the past year secured enough of the General Motors stock to have control of the organization and at the annual meeting of the General Motors held in November the board of directors was increased from fourteen to seventeen and nine new names added, only eight of the old board being retained. Among the new names added were Lammont Berlin, director of Aetna Explosives Co., Pierre Du Pont, and S. F. Prior of the Union Metallic Cartridge and Remington Arms Co. and A. H. Wiggin, C. S. Sabin, J. A. Haskell and some others, many representing the Durant interests.

100,000 Shares Involved?

Should a merger of General Motors with the Chevrolet Motor Co. be contemplated, it would call for a meeting of the stockholders of the General Motors Co. at which such action could be taken. The transfer, if made, would involve over 100,000 shares of General Motors stock which the Durant interests hold and which is sufficient to control the General Motors. At the present market price these shares are worth close to $50,000,000 and represent the holdings of Durant and the Du Pont and Remington interests. The General Motors Co. has an authorized capital of $60,000,000 of which $40,000,000 is common. Of the remaining $20,000,000 preferred only $15,000,000 is outstanding, and $16,500,000 of the common is outstanding.

Should such a merger take place it would be the outcome of the financing program of the General Motors Co., going back to the difficulties of 1910 when Eastern banking interests headed by Lee Higginson and J. W. Seligman agreed to purchase $23,000,000 of the company's five-year notes, thus advancing the General Motors sufficient cash for the payment of its debts and the building up of the business. These notes have been taken up, the last being redeemed during the past fall. During the life of the notes the General Motors stock was controlled by voting trustees until the dissolution of these last October. The object of this voting trust was to prevent any coterie of interest securing control of the stock and leaving the banking organizations without protection. With the dissolution of the voting trust it left any interest free to secure control of the stock.

May Exchange Stock

In connection with the rumor for merging the General Motors it is suggested in financial circles that the present increase of Chevrolet stock is needed to effect an exchange between Chevrolet and General Motors stock, various ratios of exchange being suggested.

Irrespective of whether these rumors are true or not the facts are that the influence of the Chevrolet interests are being rapidly increased and W. C. Durant is greatly increasing his hold on affairs.

—

$500,000 Co. to Take Over Overland Sales

TOLEDO, OHIO, Dec. 20—Willys-Overland, Inc., has been organized under the laws of Virginia with a capital of $500,000 to take over and handle the sales of the entire product of the Willys-Overland Co., this city, of which it is a subsidiary. All stock of Willys-Overland, Inc., will be owned by the Willys-Overland Co. and all officers and directors of the new corporation are from the official staff of the Willys-Overland Co.

—

Studebaker To Spend $1,000,000 To Increase Production

DETROIT, MICH., Dec. 16—To-day a three-day convention of the branch managers of the Studebaker Corp. ended here. Officials of the corporation announced the plans whereby at least $1,000,000 will be spent within the next few months to provide greater production facilities. Further additions and new buildings will be put up, among them a new drop-forge plant of at least double the size of the present one.

There were morning and afternoon sessions at which many matters of interest to the branch managers concerning the Studebaker business in general, were discussed. Talks were made by many of the officers of the company and other officials of the concern.

Reo 100% Stock Dividend

Capital Increased to $10,000,000 —Officers and Directors Re-elected

LANSING, MICH., Dec. 21—A stock dividend of 100 per cent was declared at the annual stockholders' meeting of the Reo Motor Car Co. this afternoon. The capital stock of the company was increased from $3,000,000 to $10,000,000. The directors were re-elected and they re-elected the present officers of the company as follows: President, R. E. Olds; secretary-treasurer, D. E. Bates.

Of the stock, $6,000,000 is issued, the balance of $4,000,000 remains in the treasury. The company has also paid cash dividends totalling 35 per cent this year.

Sales during ten months to the end of October totaled $16,658,698 and during that period 14,693 passenger cars were delivered. Arrangements are being completed to build up a large foreign business, which had not been attempted thus far.

The affairs of the Reo Motor Truck Co. are also in excellent shape, as announced at the stockholders' meeting. Sales totaled $2,613,208, as compared with $1,306,566 to the same time last year, 1480 trucks having been delivered. Sales for October to December were 611 trucks ahead of the corresponding period last year.

—

Lenox to Build 3-Tonners

BOSTON, MASS., Dec. 18—Officials of the Lenox Motor Car Co. are about to close negotiations with one of the big contractors who has an order from the Allies to build for it 500 or 1000 vehicles capable of carrying 3 tons. They will be built at Hyde Park, Lawrence and Fall River, the company having acquired recently factories in the two latter cities following its reorganization with a capital of $1,000,000.

—

General Electric in M. & A. M.

NEW YORK CITY, Dec. 21—The General Electric Co., Schenectady, N. Y., has joined the Motor & Accessory Manufacturers. This company is now making the Entz electric transmission system.

—

Burtsell Whitney Sales Manager

HARTFORD, CONN., Dec. 21—On Jan. 1, B. W. Burtsell, assistant factory manager of the Packard Motor Car Co., Detroit, will assume the position of sales manager of the Whitney Mfg. Co., this city.

$20,000,000 Merger Reported

Cole, Inter-State, Parker Parts, Auburn, Westcott and Others May Combine.

INDIANAPOLIS, IND., Dec. 16.—That a deal is pending in automobile circles involving the merger of some ten or twelve automobile and parts makers was confirmed to-day by C. P. Henderson, sales-manager of the Cole Motor Car Co. of this city. Although Mr. Henderson admitted that the Cole company was interested in the merger and would be one of the many companies merged into a huge combine, he would not give out any particulars, saying that final details had not been arranged.

It has been known for some time that such a consolidation was pending, but so secretly have the men behind the movement worked that it was only recently the information leaked out that several Indiana firms were interested. It is stated on good authority that the Inter-State Automobile Co., Parker Auto Parts Co., Auburn Automobile Co., Westcott Automobile Co. and several Indiana parts makers will go into the combine.

It is said that the actual capital represented in the merger will run into many millions, conservative estimates placing the mark at $30,000,000. Mr. Henderson said he believed the deal would be completed within a week. The report is that the merger will be capitalized at $20,000,000.

From Peru, Ind., comes the word that the Peru Auto Parts Co. of that city, has sent letters to its local stockholders offering to buy up the stock at $200 a share, which is double its par value, or to take them into the new company.

It is said in Peru manufacturing circles the Cole, Inter-State and Auburn are some of the concerns in the reorganization. Peru Auto Parts stock, which has a par value of $100 a share, yielded 85 per cent in recent years. The Peru stockholders have until Dec. 18 to decide whether they wish to retain their old stock and enter the new company, or take the two for one.

It is not stated what and where the other concerns that will enter the new corporation are, but it is reported in Peru that the plan of the new combine centers around Muncie, with Indianapolis and Auburn concerns taking part. The Peru Auto Parts Mfg. Co. was established in Peru six years ago, coming from New York. Since then the stock has paid 85 per cent in dividends.

A Meeting at Muncie

From Muncie, Ind., comes an authentic report that a meeting was held in that city last week, at which a large number of automobile companies were represented. It was reported at the time the conference was held that a combination was in process of formation, but no member of the conference would discuss the meeting. Among those who attended the meeting were the Ball brothers, who are back of the Inter-State company; Eugene Vatet, a Muncie capitalist; B. W. Twyman, formerly of Studebaker, but now with Inter-State; John J. Jean, who has a large foundry in Muncie and at Asbury, Mass.; A. L. Johnson and Roy Johnson, and representatives of the Motor Gear Co. and other concerns interested in the plan.

When interviewed none of the men would deny that a combination was on foot, but neither would any give out information.

Tax on Car Manufacturers Would Net $5,250,000

WASHINGTON, D. C., Dec. 18—Secretary of the Treasury in answer to a resolution adopted by the Senate regarding the estimated revenue should taxes be laid upon automobiles and tea, has sent to the Senate a report showing a tax of 25 cents per horsepower on motor cars, the tax to be paid by the manufacturers, would bring $5,250,000. Senator Gore was the author of the resolution seeking the information. It is understood that he will make use of it later when the question of raising further revenue for the government is before the Senate.

Timken-Detroit Axle Co. Makes Promotions and Appointments

DETROIT, MICH., Dec. 20—The Timken-Detroit Axle Co., has appointed J. C. Regan general factory manager. Mr. Regan, who has been during thirteen years with Yale & Towne, Stamford, Conn., was until recently assistant general superintendent of that concern.

W. L. Gleason, who has been assistant factory manager of the Timken company, has been promoted assistant to the vice-president in charge of manufacturing.

The Timken-David Brown Co., has appointed C. S. Dahlquist to the position of shop superintendent. Mr. Dahlquist was during the last four years chief engineer of the Lippard-Stewart Motor Car Co., Buffalo, and previous to this connection was with the Velie Motor Vehicle Co., and the International Harvester Co., being chief engineer of the latter's automobile division. Mr. Dahlquist will specialize on worm drive for motor trucks.

W. E. Taylor, a graduate engineer of Purdue University and recently with the Ross Gear Co., Lafayette, Ind., has joined the Timken-David Brown Co., in a selling and engineering service capacity.

White Capital to Be $16,000,000

New Company Organized—Large Interests Secured by New York Capitalists

CLEVELAND, OHIO, Dec. 18—The persistent rumors that the Morgan interests had purchased a substantial interest in the White company of this city, one of the pioneers in the automobile business, were set at rest to-day when it became known that New York interests represented by Chas. D. Barney & Co., and Montgomery, Clothier & Tyler of that city, secured a very substantial interest in the White company. It is not known whether the financial control will pass from the hands of the present White organization, or whether the Whites retain 51 per cent in the new organization to be known as the White Automobile Co., which is being organized under the laws of Ohio, with a capital stock of $16,000,000.

The new stock has not yet been listed on the stock exchange, but was all subscribed through the financial houses mentioned at $51 and is now selling on the New York curb at $53. The stock was all taken up, it is stated, in relatively small subscriptions.

No Change in Organization

Although Eastern financial interests will be represented on the board of directors of the new White Automobile Co., it is stated that the present organization with Windsor T. White, president and acting treasurer; Walter C. White, vice-president and sales manager; E. W. Hulet, vice-president and factory manager, and A. R. Warner, secretary, will be continued.

All of these officials will retain their present large holdings and will conduct the business as heretofore but their stock holdings will not bear the same relation to the complete stock issue as they have in the past. Present stock owners will hold the same amount of stock in the new organization they had in the old, plus the amount of new stock subscription they have procured.

It has been rumored for some time that there was too much inactive capital in the White organization due to the founder of the company Thomas H. White, who created the sewing machine business, and also his brother Henry White, both of whom died a year ago. These brothers had large holdings which are at present in the hands of trustees and executors which lend practically no assistance in the general work of the company. It is undoubtedly realized that additional Eastern capital will considerably broaden the interests of the organization, and bring influences to bear

which should be of material assistance in many ways.

The present White organization is capitalized at $8,000,000, made up of $5,000,000 common and $3,000,000 preferred. In the new company this has been doubled, the entire additional issue being common.

During the past year the White company has had phenomenal success, particularly in its truck department, which has been the largest truck producing organization in America.

The White company took up the manufacture of steam cars in 1889, their first car being completed and put on the road April 1, 1901. It was a new type of steam vehicle using the generator instead of the conventional boiler, basic patents on which were controlled by the White company. The manufacture of steam cars was continued steadily from April, 1901, to April, 1911, when the company took up the manufacture of gasoline cars adopting a French design of motor, the Delahaye, which was a pioneer in block cylinder construction as well as using a long stroke. This type of motor has been continued unchanged so far as its basic features are concerned from that date to the present. The company is now manufacturing two four-cylinder models having discontinued its six a year ago, excepting for custom orders.

—

Nelson Heads Miller-Lillich

FORT WAYNE, IND., Dec. 21—The Miller-Lillich Mfg. Co., which will build a factory in Fort Wayne in a short time for the manufacture of non-skid devices for automobiles, has elected the following officers for the coming year: T. O. Nelson, president; William Lillich, first vice-president, St. Louis; E. G. Reed, Fort Wayne, second vice-president; W. N. Ballou, Fort Wayne, secretary-treasurer and chairman of the board of directors. The officers with Harry Miller, St. Louis, the inventor, form the board of directors. The company is incorporated for $100,000.

October Exports $8,876,395

—

1596 Trucks Valued at $4,307,190 and 3479 Cars at $2,749,255

WASHINGTON, D. C., Dec. 18.—Tremendous gains continue to be made in the export trade in motor vehicles, according to figures announced today by the Departent of Commerce. During October last 1596 commercial cars, valued at $4,307,190; 3479 passenger cars, valued at $2,749,255, and parts, not including engines and tires, to the value of $1,819,950, were shipped abroad. During October a year ago the exports amounted to 672 commercial cars, valued at $2,286,964; 731 passenger cars, valued at $678,387, and parts, not including engines and tires, to the value of $404,360. The shipments during the nine months ended October, 1915, amounted to 18,865 commercial cars, valued at $52,076,406; 34,515 passenger cars, valued at $29,543,227, and parts, not including engines and tires, to the value of $12,814,809. During the same period of 1914 these exports were as follows: Commercial cars, 1309, valued at $3,353,509; passenger cars, 20,262, valued at $17,888,351; parts, not including engines and tires, $4,855,525.

2021 Cars to United Kingdom

The United Kingdom's imports of American cars in October last amounted to 2021 machines, valued at $2,730,468, as against 415 cars, valued at $829,982, imported during October a year ago. During the nine months' period these imports rose from 5545 cars, valued at $5,111,008, in 1914, to 21,455 cars, valued at $31,379,217, in 1915.

The shipments to France amounted to 298 cars, valued at $912,139, in October, 1915, as against 108 machines, valued at $171,049, shipped there in October a year ago, while during the nine months' period the shipments increased from 1152 machines, valued at $796,685, in 1914, to 5183 cars, valued at $13,038,767, in 1915.

There were no shipments to Germany either in October last or in October a year ago. During the nine months of this year four cars, valued at $2800, were shipped to that country, as against 1063 cars, valued at $799,552, shipped during the nine months' period of 1914.

Forty cars, valued at $25,887, were shipped to Italy during October last, while in October a year ago the number was two and the value $1450. During the nine months' period the shipments to Italy amounted to 233 cars, valued at $151,698, in 1914, and to 210 cars, valued at $134,901, in 1915.

814 Cars to "Other Europe"

Under the heading, Other Europe, 814 cars, valued at $1,920,176, were shipped to unnamed countries in October last, as against 346 cars, valued at $1,461,191, in October a year ago. These shipments amounted to 2736 cars, valued at $3,357,408, during the nine months of 1914, increasing to 7502 cars, valued at $20,003,140 during the same period of this year.

During October last 189 cars, valued at $202,552, were shipped into Canada, as against 127 cars, valued at $143,916, shipped there in October, 1914. For the nine months' period the official figures shows that 3981 cars, valued at $5,024,978, were shipped to Canada in 1914, increasing to 5238 cars, but with a decreased value to $4,154,137, in 1915.

Mexico's contribution was $12,250 for thirteen cars in October, 1914, while in October last it was only $8,200 for five cars. During the nine months' period the shipment amounted to seventy-three cars, value at $87,384, in 1914, and eighty-eight cars, valued at $84,141, in 1915.

The shipments to the West Indies and Bermuda amounted to 267 cars, valued at $173,355, in October last, and in October a year ago to seventy-two cars, valued at $51,792. During the nine months' period the exports increased from 466

cars, valued at $394,342, in 1914, to 2625 cars, valued at $1,478,360 for the corresponding period in 1915.

South America Gains

Our export trade with South America is growing steadily. During October last 383 cars, valued at $210,840, were shipped there, as against forty-eight cars, valued at $33,242, exported in October a year ago. During the nine months' period the exports increased from 963 cars, valued at $775,504, in 1914, to 2464 cars, valued at $1,277,326, in 1915.

British Oceania is also showing a fondness for America cars, the figures showing that 447 cars, valued at $360,260, were shipped there in October last, as against 190 cars, valued at $169,582, exported there in October a year ago. During the nine months' period the exports increased from 3075 cars, valued at $2,619,212, in 1914, to 3594 cars, valued at $3,041,852, in 1915.

Asia and Oceania Buy More

Asia and other Oceania took 295 cars, valued at $284,063, from this country in October last, as against sixty-three cars, valued at $71,956, in October a year ago. The shipments for the nine months' period increased from 1295 cars, valued at $1,240,336, in 1914, to 3245 cars, valued at $5,474,001, in 1915.

Shipments to other countries increased from twenty-eight cars, valued at $22,991, in October, 1914, to 308 cars, valued at $224,455, in October last, and from 989 cars, valued at $883,753, during the nine months of 1914, to 1772 cars, valued at $1,550,991, during the same period of this year.

The table appearing at the bottom of page 1158 shows the exports by countries in more complete detail.

Insurance Rates Lower

Underwriters Adopt New Rates Effective Jan. 1— To Cancel Policies

NEW YORK CITY, Dec. 17—Automobile insurance rates are lower. At a special meeting of the Automobile Underwriters' Conference new rates were adopted for the full form of policy to be effective on all policies attaching on and after Jan. 1, 1916. Existing policies are cancelled, for rewriting must be on a short rate basis only.

The following rules and qualifications were promulgated:

REDUCTIONS—Fifty cents allowed off Class A rates, 75 cents allowed off Class B and C rates, and $1 off Class D and E rates shown on schedule, for use of the Standard fire form of policy or the Conference form with the reduced rate of indorsement (excluding theft, valuation and automatic reinstatement clauses) attached.

ELECTRIC AUTOMOBILES—This and next year models, 1¼ per cent; last year, 1½ per cent; year before last, 1¾ per cent; three-year old, 2 per cent; older models, 2¼ per cent. Amounts at option of underwriter; minimum premium, $10. A reduction of ¼ per cent allowed for restricted form; minimum premium, $10.

DEALERS' AUTOMOBILES—On new gasoline and steam cars charge 2¼ per cent in column A, 2½ per cent in columns B and C, and 2¾ per cent for all others. On new electric cars charge 2 per cent for all models. On all second-hand cars 1 per cent additional rate must be charged. No rate cancellation allowed with a minimum charge of $1, except that the minimum charge on new cars listed at less than $1,200 shall be 50 cents. Amounts insured at option of underwriters. A reduction of ¼ per cent will be allowed for the attachment of the reduced rate indorsement, but in all cases the minimum charges of $1 and of 50 cents shall apply as above indicated.

NOTE—Automobiles in the hands of dealers may be written under the ordinary form of policy at rates provided for private pleasure was subject to cancellation on a short rate basis only, except pro rata cancellation may be allowed when a new policy is issued on the same car.

THEFT, FULL COVERAGE—For $15 additional premium, the indorsement provided for this purpose may be attached to the policy, giving protection against loss by theft for the full amount.

FIRE EXTINGUISHER ALLOWANCE—An allowance of 15 per cent may be granted from the premium obtained under all rates named in this schedule (except from the $15 additional charge for full theft coverage) for the attachment of the fire extinguisher indorsement as provided under conference rules.

PERSONAL EFFECTS CLAUSE—The policy may be extended to cover personal effects, a specific amount being insured, at the same rate as charge on the automobile. Theft, robbery and pilferage not covered.

ADDITIONAL BODIES—In determining the original list price of automobiles having more than one body the list price of the automobile equipped with the higher priced body shall be taken as the original list price. No change to be made in the classification of cars during the policy period. In the case of automobiles equipped with an extra body or bodies a specific amount must be applied to the chassis and equipment and to each body, the same rate being charged on the extra body or bodies as is charged on the automobile.

New Insurance Rates in Tabulated Form

*Original list price of automobile when new.	Class A. $3,500 and up.	Class B. $2,100 to $3,499	Class C. $1,200 to $2,099	Class D. $700 to $1,199	Class E. $699 and under

Snyder Resigns from Arbenz

CHILLICOTHE, OHIO, Dec. 21—C. O. Snyder, engineer and factory manager of the Arbenz Car Co., Chillicothe, Ohio, has resigned but has not announced his plans for the future.

Mr. Snyder was one of the pioneers in designing eight-cylinder motors in America, having built one in 1906.

Bates Is Re-Elected Chairman

LANSING, MICH., Dec. 16—Don E. Bates, secretary-treasurer of the Reo Motor Car Co., has been re-elected chairman of the Manufacturers' and Jobbers' division of the Lansing Chamber of Commerce.

S.A.E. Studies Army Requirements

Tactical Methods of Handling Supplies for a Division, Metropolitan Section Subject

NEW YORK CITY, Dec. 17—At a meeting of the Metropolitan Section of the Society of Automobile Engineers, held at the Automobile Club of America, Capt. Gordon Johnson, of the 11th Cavalry, U. S. Army, delivered a lecture on the requirements of army transport service.

Captain Johnson stated that it was not his idea to outline the specifications of an ideal track for army service, but on the other hand to point out the problems with which an army transport system has to deal in maintaining supplies and performing other necessary duties. In discussing the requirements of army service, Captain Johnson pointed out that the division is the tactical part of an army which must be considered in arranging for transportation. It consists of an entire unit in itself and has its independent baggage train. It was pointed out that the 15,000 men in such a division could march only 12½ miles per day and that in marching order, the division was weak and unprepared either for offense or defense. The task of feeding a division on a march was an enormous one and also that of deploying it into battle formation is another difficult task.

Captain Johnson in his address pointed out the importance of the transport system in maintaining the morale of the troops which is all important in creating the effectiveness necessary for a successful campaign.

—

Detroit Auto Products Co. Formed

DETROIT, MICH., Dec. 17—Automobile parts and accessories on a large scale are to be made by the Detroit Auto Products Co., a new concern which has been incorporated and whose capital stock is temporarily $50,000. Those interested in the company are Joseph, Eugene and Leo Siegel, respectively secretary and general manager, treasurer and assistant general manager of the American Lady Corset Co., Detroit.

—

Chalmers Starts Instruction School

DETROIT, MICH., Dec. 20—The Chalmers Motor Co., recently started an instruction school for the benefit of its employees, and, according to S. H. Humphrey, vice-president in charge of manufacturing, the initiative of the company is meeting with ready response among the 5000 men now employed.

The classes which are held in the new auditorium are under the direction of C. G. Arthur, a mechanical engineer and technical writer. They meet after the regular working hours, on Tuesday and on Friday, there being two sessions, one at 3.15 and the other at 5.30 p. m. At the first sessions the instruction consisted in lessons in reading blue prints, review work in mathematics, talks on general shop practice. Gradually the members will be made familiar with every step in the manufacture of a Chalmers car, so that they can be transferred from one department to another, with practical knowledge as to the work they will have to perform in the particular department.

—

Packard Truck Sales Managers Find Business Booming

DETROIT, MICH., Dec. 15—Monday and Tuesday truck sales managers of the branches of the Packard Motor Car Co., met here at a convention held at the Packard plant. They reported that the year now ending was the best they ever had and that the outlook for 1916 is such that the demand for trucks and delivery cars will be greater than manufacturers anticipate. The scheduled output of Packard trucks for next year has already been largely contracted for and it will probably necessitate an increase in production over the number originally planned. The sales managers say that the demand for the trucks has been gradually increasing all through the land, and that it will continue stronger, as business men are realizing more and more that the truck or delivery car is the means of more business and saves them money.

It was announced by the Packard officials that, beginning this week, the first deliveries will be made of the two latest models known as the light duty models, respectively of 1 and 1½ tons.

Those in attendance were: Hartley Howard, Jr., Pittsburgh; F. A. Jones, Chicago; T. P. Myers, New York; H. S. Norton, Cleveland; G. E. Pagett, St. Louis; S. L. Prime, Boston; W. F. Roth, Philadelphia; C. C. Spencer, Detroit.

—

Oakland Service Managers Meet

PONTIAC, MICH., Dec. 18—About seventy-five service managers from Oakland branches and agencies throughout the country, met at the plant of the Oakland Motor Car Co., here, this week, to become thoroughly acquainted with the new Oakland eight and the service policy of the company.

—

W. C. Andrews Dies

NEW YORK CITY, Dec. 21—W. C. Andrews, advertising manager of the Edison Storage Battery Co., Orange, N. J., died suddenly yesterday.

Guayule Rubber Industry to Boom

Recognition of Carranza Government by United States Gives Confidence

TORREON, MEXICO, Dec. 17—If circumstances and outward indications count for much the guayule rubber industry is on the verge of the greatest boom in its history. Immediately following the announcement that the United States had recognized Carranza and his de facto government the American representatives of a number of large synidicates flocked into this part of the country and began purchasing leases on guayule producing land. Many such leases had already been entered into with the owners of the land while the latter were refugees in the United States. It is estimated that not less than 10,000,000 acres of land upon which the guayule shrub grows profusely have been leased to Americans during the last two weeks. The leases only cover the guayule shrub, and do not interfere in any manner with any other uses to which the owners of the land may want to put their respective properties. The guayule producing region is confined principally to the highlands of the States of Coahuila, Durango, Zacatecas and Nuevo Leon.

New Factories Planned

It is stated this rush to obtain leases on land for the use of the guayule shrub that grows thereon is preliminary to the establishment of a number of new rubber factories in this section. In fact, it is known that the building of two new factories of this character will soon be started in Torreon. In both instances the principal stock will be held by American automobile tire manufacturers, it is stated. T. F. Oberton of Detroit, Mich., and Frank Serrenth of Indianapolis, Ind., are here arranging for building the factories.

New Shrubs Grown

During the five years that the manufacture of guayule rubber has been greatly curtailed on account of the revolutionary disturbances the cut-over lands have grown a new supply of the shrubs and the raw material is now in greater abundance than it was at the beginning of the industry. This is due also to the fact that large tracts of land that were seeded with guayule when it was found that the shrub was valuable are now covered with a bountiful crop of the raw material.

Extensive Experiments

For several years the Intercontinental Rubber Co. had several expert American botanists in its employ for the special

purpose of devising the best means of propagating the guayule shrub. These scientists conducted their experiments on an extensive scale upon the Cedros hacienda and were successful in proving that the shrub could be successfully grown from the seed.

—

200,000 Overlands for 1916

BOSTON, MASS., Dec. 20—There were 150 dealers affiliated with the Connell & McKone Co., Eastern Massachusetts distributors of the Overland and Willys-Knight cars present at the annual banquet of the organization here this evening at the Hotel Lenox. W. J. Connell presided. There were factory representatives present to explain things to the dealers about the increased production.

Joseph McDuffie, assistant sales manager, said that the factory contemplated an increase in production of from 45,000 cars in the 1915 season to at least 200,000 cars in 1916, and perhaps 225,000.

W. B. Sawyer, was introduced as the man who is to have charge of the New England zone to be established at Boston Jan. 1 next. It will be one of thirteen such zones.

Mr. Connell said there would be something very new given out at the New York show which would create as much of a sensation as the announcement made recently of the $615 cars. Just what it was he could not state, he said, but urged all the dealers to try to go to New York to be present when the announcement is made by Mr. Willys.

—

Puritan Buys Cyclecar Service

DETROIT, MICH., Dec. 18—The Puritan Machine Co., this city, has purchased the complete service and repair parts of the Scripps-Booth Cycle Car Co. and these can now be obtained from the Puritan company. The purchase makes a total of seventy-one companies whose service and repair parts have been taken over by the Puritan concern.

—

Locomobile Adopts Eisemann

NEW YORK CITY, Dec. 18—The Locomobile company, Bridgeport, Conn., has adopted type EMR6 dual Eisemann magneto and type DC Eisemann coil as standard equipment on its passenger cars, which will all be six-cylinder designs for the coming season.

—

Detroit Gets New Freight Cars

DETROIT, MICH., Dec. 17—The first lot of the new automobile freight cars of which the Michigan Central railroad has ordered more than 2500, are expected here Dec. 25. Probably twenty-five a day will be added to the Detroit yards, and by the end of the month it is expected that there will be considerable relief of the congestion in this district.

Gasoline Prices Still Higher

—

Unprecedented Demand with Scarcity of Supply Affects Rates in All Sections

NEW YORK CITY, Dec. 18—The Texas Co. to-day raised the price of gasoline to 21 cents a gallon wholesale and The Standard Oil Co. has followed suit with a 1-cent rise making the price to owners 21 cents a gallon. Consumers last May were paying 11 to 15 cents a gallon. Then prices rose gradually at the rate of about 1 cent a month.

The reason for the advance given by the oil companies is that the demand has exceeded the supply. Experts say 30,000,000 barrels will be consumed in the United States in 1916. There is an unusual shortage of crude oil from which to refine the gasoline, and hauling facilities for the crude product to the Eastern terminals are anything but the best.

General Advance in East

A general advance, following New York prices, has occurred in the East. All points in New York and Connecticut are on 21 cents a gallon basis; other New England States 22 cents. At Washington, D. C., and Alexandria, Va., the advance was 1½ cents, making present price 19½ cents.

Gasoline, tank wagon basis, has been advanced 1 cent at all stations in South Carolina. At Charleston, S. C., the price is now 21½ cents.

The Atlantic Refining Co. has advanced the price in Pittsburgh, tank wagon basis, 1 cent to 20 cents. The prices at the service stations range from 20 to 24 cents a gallon.

St. Louis gasoline is now quoting at 14.9 cents a gallon by both Standard Oil Co. and Independents. Denver prices have been raised 1 cent to 21, the highest there in two years.

Gasoline in Minneapolis has advanced at the filling stations to 16½ cents. This is a total of 6 cents since last summer. The last previous advance was Nov. 23. At Duluth the price is 20 cents. Last summer the price was 10 cents.

Gasoline in Texas took another leap, going from 19 to 21 cents, the highest price for gasoline in recent years. It is predicted by oil dealers that the price will go to 25 cents.

—

Boom in Tampico Oil Fields

TAMPICO, MEXICO, Dec. 21—Industrial affairs and business conditions generally in Tampico and the adjacent oil fields are rapidly getting back to normal. American well drillers and other skilled laborers from the United States are flocking into the different oil camps in large numbers. New arrivals are coming in on every boat and train and there are already strong evidences of a revival of the oil boom that was in existence here when revolutionary events put a stop to development and promotion operations. New rigs for boring wells are being sent into the different oil fields daily and the work of exploitation will be in progress on an extensive scale within a few weeks. Much new tankage is being received and all of the tank farms in the vicinity of Tampico are to be enlarged.

The present steel storage tank facilities of the Tampico territory are approximately 18,000,000 barrels, and earthen tanks perhaps 2,000,000 barrels. It is said that the existing stocks are nearly equal to the storage capacity. If things go as well with the industry during the coming year as is now indicated the storage facilities of the producing districts and Tampico at the close of 1916 will probably be three times what they are to-day. Unless wonderful improvements and additions in transportation and marketing facilities are obtained meanwhile so that the product can be moved more promptly than in the past.

It is expected that with a further improvement of conditions here in the matter of pipe line and tank-steamer transportation the Pierce Oil Corp. will open its 30,000-barrel refinery at Vera Cruz. The plant has been closed for several years. It is also reported that the company will enlarge its refinery at Tampico during the coming year. The refining and asphalt plant of the Mexican Petroleum Co. at Ebano which was built in the early days of oil development in the Gulf coast region will be either greatly enlarged, it is said, or the Doheny interests which own it and the Huasteca Petroleum Co. will build a new plant of large capacity at Tampico. The Huasteca Petroleum Co., recently finished building a 10,000-barrel topping plant here, and the Standard Oil Co. of New Jersey began operating a new 4000-barrel plant of similar type in the suburb of La Barra. The new refinery of the Eagle Petroleum Co. at Tampico is also in operation. The same interests own the refinery at Minatitlan, on the Isthmus of Tehunatepec.

Among the larger companies that are said to have under consideration plans for the building of refineries at Tampico or in this vicinity are the East Coast Oil Co., which is understood to be owned by Southern Pacific interests; the Corona Petroleum Co., a subsidiary of the Dutch-Shell Trading and Transport Co., the Penn-Mex Fuel Co., the Magnolia Petroleum Co., The Texas Co., the Gul-Refining Co., and the Mexican Oil Co. Most of these companies have large quantities of oil in storage here at this time.

Briscoe Capital to Be $6,000,000

—

Swift Interests Behind New Co.—Lewis Plant Bought—30,000 Cars Planned

JACKSON, MICH., Dec. 17—Final arrangements for the reorganization of the Briscoe Motor Co. and its affiliated concern, the Argo Motor Co., both of this city, were made to-day whereby the Swift interests of Chicago are to back the greatly enlarged organization originally brought to this city by Benjamin Briscoe and his associates. The deal means an increase in the capital stock of the Briscoe Motor Co. to $6,000,000, of which $4,500,000 is common and the balance preferred.

Coincident with the perfecting of this enlargement, it becomes known that the large and modern plants of the Lewis Spring & Axle Co. here have been bought by the Briscoe combination, as well as some of the equipment in them. These plants have been occupied in the production by the Lewis concern of the Hollier eight, but the purchase does not mean that Lewis will go out of business. On the contrary, the plant at Chelsea, Mich., which Lewis bought in August, will be used for the making of the Hollier eight, according to Fred Lewis. This is the old Flanders plant and is a large four-story structure. It has been fully equipped with all the necessary machinery and equipment by the Lewis company and has been in operation for some time. Its production capacity is 20,000 cars or more.

Some time ago this movement of providing greater production facilities was begun by the Briscoe concerns, and as was reported in THE AUTOMOBILE for Nov. 11, the Jackson Motor Parts Co. was formed with a capital of $200,000 to make parts for Argo and Briscoe cars. More recently, the machinery and equipment of the new defunct Mason Motor Car Co., Waterloo, Iowa, was bought and has been brought to Jackson for installation in the motor parts plant. The plant of the Jackson Metal Products Co. has also been taken over to give added production facilities.

Benjamin Briscoe is still the head of the reorganized company; Frank Briscoe, who only recently became general manager of the old company, appears in the new as vice-president in charge of manufacturing; L. E. Wilson of Chicago, who recently became associated with the Briscoe concern as general manager, has the title of vice-president in charge of sales and advertising in the new combination.

The result of all these added production facilities is said to be a schedule of 30,000 cars for the first year, of which 5000 are to be light deliveries, 10,000 the present models, and 15,000 a new four-cylinder design at low price.

—

Market Prices Higher

NEW YORK CITY, Dec. 21—With the exception of a 2-cent drop in aluminum, market prices last week were higher. Copper, both electrolytic and lake, went up to 20 cents a pound and tin closed yesterday at $40 per 100 lb., just $2.25 higher than the opening price on Tuesday. Steel prices remained constant throughout the week.

Gasoline prices last week resumed their upward movement with the fuel growing scarcer each day.

Fine up-river Para again went up, reaching 77 cents yesterday. It is expected that the high price of rubber in all grades will have a material effect in a general rise in tire prices in the near future.

—

National Acme Mfg. Co. to Increase Capital $6,500,000

CLEVELAND, OHIO, Dec. 20—Stockholders of the National Acme Mfg. Co. have received notice of a prospective increase in the capital stock from $2,500,000 to $9,000,000.

This increase is said to presage the consolidation of the Windsor Machine Co. of Windsor, Vt., with the National Acme Mfg. Co., which would require approximately $3,500,000, but this deal at the present time is only in the tentative state.

Should the present plans go through the company's stock will consist of $1,500,000 of 6 per cent preferred stock and $7,500,000 common stock. A portion of each issue would be sold to provide funds to take care of the purchase of the Vermont company.

The National Acme Mfg. Co., among other things, manufactures machine tools and automobile and electrical parts.

—

Ajax Rubber Co. Formed with $5,000,000 Capital

TRENTON, N. J., Dec. 18—To refinance and increase its output the Ajax Rubber Co. has been incorporated with a capital of $5,000,000, of which $3,000,000 will be issued. The par value of the stock is $50 a share. The new company will take over the business and good will of the Ajax-Grieb Rubber Co. and the stock of the latter company canceled is acquired by the new company. The stock has been underwritten at $65 a share.

A new plant, 200 by 350 ft., three stories, is at present being built. The foundations will permit the building of three additional stories.

Beginning with a cash capital of $18,500, to which no future cash investment was added, except the sum of $100,000 during the year 1911, the present net assets of over $2,000,000 represent an accumulation of surplus profits after payment of dividends. The net earnings for the last four fiscal years ended Aug. 31, 1915, averaged over $430,000 per annum, equivalent to over 14 per cent on a par value of $3,000,000. The purpose of the present financing is to retire all the outstanding preferred stock of the Ajax-Grieb Rubber Co., and to finance the contemplated extension of its factories, which will materially increase its output.

The net sales, it is predicted, for the current year based on actual earnings of 3½ months and contracts closed should approximate $750,000, or 25 per cent on the $3,000,000 stock to be issued.

—

Hercules Elects Directors

CANTON, OHIO, Dec. 16—Following the organization of the Hercules Motor Mfg. Co. last week, it has been announced that operations will be started in February. At a meeting of those interested in the plant, the following directors were elected: H. H. Timken, J. G. Obermier and O. J. Strayer, of Canton; G. M. Mather, of Cleveland; L. Pulcher of Detroit, and Charles Balough of Springfield.

After the election of directors Charles

Balough was elected president; Gordon Mather was elected vice-president and O. J. Strayer, secretary and treasurer.

The location of the plant will be near the Aultman group and 5 acres of ground have been purchased. The first building will cost $75,000. The building will be 65 by 400 ft. of reinforced concrete and two stories high. New machinery will cost over $75,000.

—

Gier & Dail Capital $500,000

LANSING, MICH., Dec. 16—The Gier & Dail Mfg. Co., manufacturer of sheet metal stampings has increased its capital stock from $300,000 to $500,000 of which $400,000 is paid in, and will soon begin making automobile bodies, besides increasing the production of its other lines. A new plant is to be put up for the body department. W. K. Prudden is president of the company; Harry E. Bradner, vice-president; B. S. Gier, secretary and manager, and H. F. Harper, treasurer.

—

Franklin Capital Now $2,600,000

ALBANY, N. Y., Dec. 15—The H. H. Franklin Mfg. Co., Syracuse, has increased its capital from $1,500,000 to $2,600,000.

—

Dividends Declared

Electric Storage Battery Co.; 1 per cent from net earnings on both common and preferred, payable Jan. 3, to holders of Dec. 21.

Firestone Tire & Rubber Co.; quarterly of 1¾ per cent on preferred and 5 per cent on common, payable Jan. 15.

Security Prices Lower

General Motors Drops 37 Points—Packard Features with 25-Point Rise

NEW YORK CITY, Dec. 21—Automobile and accessory securities were dull and lower in price last week, a number of the prominent issues showing losses. A reaction set in on a number of the stocks which heretofore have shown strength on the exchange. General Motors broke around the latter part of the week, said to be due to a readjustment of the price at which it has been carried in banking loans. The closing price yesterday was 501, just 37 points under last Monday's price. Chevrolet dropped 10 points and the new White stock went down 58 points. The New York Curb Market Assn. has approved for temporary quotation and trading 320,000 capital shares of the White stock, par value $50, to be traded in when-as-and-if-issued.

Notwithstanding the general dullness of the market, several of the issues showed considerable strength. Packard common went up 25 points and closed yesterday at 175. Studebaker common showed a gain of 3 points. This stock went up on heavy buying on Wednesday and while speculative attention centered upon it the stock was nevertheless very strong, but when another stock came to the fore, the rise petered out. What happened to Studebaker was typical of the whole market and revealed its professional character. Willys-Overland common rose 5 points. A preliminary estimate of the Overland earnings for the fiscal year show net profits around $15,000,000, a figure which would equal better than 65 per cent on the present $21,000,000 of common stock after taking out the 7 per cent dividend on the $15,000,000 preferred.

Issues on the Detroit Exchange were in sympathy with the local markets. General Motors went down 25 points and Paige dropped 15 points. Packard featured the market with a 32-point rise, the closing on Saturday being 184.

—

Akron Rubber Co.'s to Pay $800,000 in Dividends

AKRON, OHIO, Dec. 18—Payments of dividends announced by the large rubber companies of Akron, Ohio, will total more than $800,000 Jan. 1. It is believed that about half of the amount will be paid to stockholders living in Akron.

—

Lee Tire Incorporated for $750,000

ALBANY, N. Y., Dec. 16—The Lee Tire & Rubber Corp., has incorporated with a capital of $750,000. The directors are R. E. Corcoran, Brooklyn; Edward Roeder, Ridgefield Park, N. J., and James Gru, Brooklyn.

—

H. A. Lozier Co. Incorporated

CLEVELAND, OHIO, Dec. 20—The H. A. Lozier Co. has been incorporated with a capital of $10,000 to manufacture and deal in automobiles. The incorporators are: H. A. Lozier, A. W. Foote, E. G. Tillotson, Frank G. Ginn and R. B. Sheridan.

No Tire Famine in France

Manufacturers' Difficulty Is Irregular Delivery of Materials —Metric Sizes Used

PARIS, Dec. 10—While there is nothing approaching a tire famine in France, manufacturers are meeting with unusual difficulties in keeping their establishments running regularly. Raw rubber is obtainable in as big quantities as can be desired, but the various materials and compounds required in tire manufacture are delivered in a very irregular manner. First one material, then another, is found to be short, or to have been delayed in transportation, thus throwing departments or even the whole factory out of gear.

"We have always managed to make good on deliveries," declared the head of a leading factory in France, "but so many unexpected difficulties crop up every day that the life of a tire manufacturer is full of trouble. At one time it looked as if we might be held for lack of coal; that difficulty was overcome, and we now hold stocks for some months ahead. Benzol can only be obtained through the government, and as supplies are given out very economically, any delay in delivery is liable to put a factory out of gear. We have been able to deliver all the stocks of tires that the armies could possibly use, but it has been a more difficult task to keep the factories running regularly than the public has any idea of.

"According to a neutral tire manufacturer who has been able to make a trip into Germany, the most rigid economy is being exercised in that country, and by reason of this and the huge reserve supplies laid in before the outbreak of war, the Germans expect to keep going two years more before their tire supply fails entirely."

Inch Sizes Abolished

The use of inch size pneumatic tires in the French army has been entirely abolished. Some time ago the Jeffery company received a big order for ¾-ton chassis to be used as ambulances, and equipped with twin and single pneumatic tires. All these were delivered with millimeter size rims, to take French size tires. Trucks are being delivered with solid tires in inch sizes, but whenever replacements are needed, conversion is made to millimeter sizes. A sufficient stock of spare wheels is kept on hand so that changes can be made without holding the truck out of service; the wheels taken off are sent to have their rims transformed and when fitted with the millimeter size tires are used on the next set of trucks coming in for re-tiring.

The demountable solid tire has been received in France with a certain amount of suspicion. However, it is being given a genuine test on Pierce and Packard trucks, and up to the present no serious fault has been brought against it.

Manufacturers in France are not able to handle much private business, owing to the difficulty in getting labor and supplies for more than army requirements. There is a demand for tires, and some makers would like to meet it, for they state that it would be more profitable than fulfilling army contracts. Since the outbreak of war the price paid by the army has decreased, owing to a cut by one of the leading French manufacturers. As the cost of all raw material has increased enormously, army contracts are no longer money making propositions. The leading maker of solid tires is now Bergougnan; Michelin is the biggest single maker of pneumatics, and is making this type of tire only. Goodrich is manufacturing pneumatics and solid tires, and is importing also; the French Dunlop factory is not making tires, but the English factory of this company is running strong. Pirelli is importing some tires from Italy into France. The United States Rubber Co. has a representative in France at present and is investigating the market. It is declared by the French trade that the high duty on American tires makes it impossible for any American firm to sell tires profitably in France.

Hillclimb Event for Pike's Peak in Sept.

NEW YORK CITY, Dec. 20—A hillclimb will be held over the Pike's Peak highway next September. Up to September last, only 12,000 ft. above sea level of the roadway was completed. The road has since been completed right to the top.

The hillclimb will be for cars of every class, both touring and special, and also for motor trucks, both with and without loads. A trophy for the free-for-all contest will be of Cripple Creek gold and will be a replica of Pike's Peak in solid gold with a roadway which will be a duplicate of the Pike's Peak way leading to the top.

—

Motometer Adds Midget Model

NEW YORK CITY, Dec. 21—The Motometer Co., this city, is placing on the market a new model Moto-Meter, styled the Midget which is to sell for $2.50. Except that it is smaller in diameter than the two existing models and measures 2¼ in. as compared with 3¼ for the others it is exactly similar in principle and practically the same in construction. Like the Junior model, it has no glass over the thermometer scale. It is inserted through a ⅞-in. hole in the radiator cap and bolted in place.

Paris Fuel Shortage Hits Taxis

Army Supply Adequate But Private Motorists Buy ½ Gal. at a Time

PARIS, Dec. 9—Owing to the gasoline shortage the Paris taxicab service has been disorganized and friction has arisen among the public, taxicab drivers and the municipal authorities. The shortage is only relative. Supplies are coming through in sufficient quantity and with sufficient regularity to satisfy all the requirements of the army. But the same does not apply to supplies for civilians, and for reasons which are variously attributed to actual shortage, lack of cans, and absence of river tank steamers, the private motorists of Paris have been reduced to buying gasoline in quantities of ½ gal. at a time. The persons most severely affected are taxicab drivers. Before the war these men obtained gasoline and benzol from their own co-operative supply societies. Benzol has been taken off the market in order to make explosives. The co-operative societies have had great difficulty in getting supplies of gasoline, and the ordinary dealers and garage proprietors who are living on a day-to-day supply, are not at all anxious to receive taxicab drivers as temporary clients. The situation has thus arisen of taxicab drivers being unable to get fuel, or obtaining it in such small quantities that they cannot remain on the streets as long as usual. As the motor bus service of Paris has been suspended since the first day of the war, and as electric trolley cars never have been very plentiful in the central parts of the city, the general public is seriously inconvenienced by the reduction of the number of cabs.

Drivers' Supply Limited

A few of the big taxicab companies now sell their drivers 2.6 gal. of gasoline per day for $1; the men have to pay 40 cents city tax to take this amount of gasoline into Paris. To buy in the open market, this quantity of gasoline would cost $1.20, plus city tax. As 2.6 gal. of gasoline are not sufficient for a full day's work, the drivers working for the big companies prefer to return to the garage as soon as they have used up this amount, rather than buy an extra supply from the dealers or garages. In consequence it has become a very difficult matter to get a taxicab in Paris after 9 o'clock in the evening. The theatrical profession, restaurant proprietors and the general public are angered at the shortage of taxis and have appealed to the chief of police, who has reluctantly had to admit that he has no power to make drivers

stay on the streets longer than they desire. Most of the men would be willing to stay out if they could get extra pay after 9 o'clock, but the public who do not understand the details of the case consider that they are being cheated if the driver does not operate at the normal tariff indicated on his instrument.

It has to be admitted that the taxicab driver's lot is not a happy one. Before the war he could buy unlimited quantities of benzol at 23 cents a gallon. Now, if he belongs to one of the big companies he can buy a limited supply of gasoline at 38 cents a gallon, while if he runs his own cab, or belongs to one of the smaller companies, he has to pay from 40 to 45 cents a gallon. In addition to this he has to pay a local tax of approximately 3 cents per gallon on benzol and 4 cents per gallon on gasoline taken into the city of Paris. In other words drivers are using gasoline at 49 cents a gallon where they were formerly running on benzol at 26 cents a gallon. Calculating on a consumption of 5 gal. per day, the extra cost to the driver is $1.15. As the men buy their own fuel and take a percentage of the total earnings of the cab, all the extra cost of operation comes out of their pockets.

25,254 Fords in Kansas

TOPEKA, KAN., Dec. 18—Over one-third of the cars in Kansas are Fords, 25,254 out of 61,000 cars being of this make. Sedgwick County, with 1131 cars leads in number, while Grant County is at the bottom, with but eleven. The average to a county is about 1340. March 1 there were 61,000 cars listed for taxaxtion, but at present more than 70,000 cars have been licensed.

The list of automobiles in the State by makes includes:

Auburn	652
Buick	5,998
Cadillac	855
Chalmers	732
Dodge	551
E. M. F.	699
Ford	25,254
Hudson	879
Hupmobile	755
Jackson	512
Maxwell	3,026
Mitchell	707
Oakland	720
Overland	5,115
Regal	523
Reo	2,389
Saxon	378
Studebaker	3,427
Velie	406

Ford Gains 66 2/3 Per Cent

DETROIT, MICH., Dec. 17—During the first four months of the fiscal year of the Ford Motor Co., that is from August to the end of November, the production and sales were approximately 66 2/3 per cent larger than during the similar period in 1914, when, according to figures then furnished by the Ford company, 76,906 cars were made and sold.

$13,140,000 Upkeep in Kansas

—

73,000 Cars Cost Owners That Total Annually—Car Value $75,000,000

TOPEKA, KAN., Dec. 18—C. W. Myers, head of the State Motor Car License Department, has just compiled a set of figures showing that Kansas owners expend $13,140,000 a year on the maintenance and upkeep of their cars. His figures are based on the license record, showing ownership of 73,000 cars, exclusive of those in the hands of the dealers, within the State.

Mr. Myers has taken an average of $15 a month as the upkeep cost and thus worked out his findings. It shows a cost of $180 a year a car, divided equally between gasoline and oil, tires and accessories and labor and repairing. The value of the Kansas owned cars is given at $75,000,000.

"The motor not only has converted blacksmith shops into garages, but also has driven the old-fashioned livery stables out of business," Mr. Myers explained. "Rarely indeed now can a livery stable be found in the small towns, and they are getting scarce in the larger places. For instance, Topeka has only two now, whereas a few years ago there were a dozen or more. The jitney, the bus and the truck have absorbed the livery field."

—

To Handle Madison Car and Batavia Tire in Mich.

DETROIT, MICH., Dec. 20—A new company, known as the Madison Motor Sales & Service Co. has been organized, with W. D. Block as president, to handle the State of Michigan for Madison cars and Batavia tires. Quarters have been taken at 1425 Woodward Avenue, Detroit, Mich.

—

Huff Laboratories, Inc., Formed

DETROIT, MICH., Dec. 17—The Huff Laboratories, Inc., has been incorporated with a capital stock of $20,000. Its headquarters are in the Garfield Building, here. Those interested are E. S. Huff, formerly of the research department of the Maxwell Motor Co.; H. L. Cunningham, of the Cunningham Auto Co., and Orvice La Bounty. The corporation will do general research work.

—

Newmark Writes a Book

DETROIT, MICH., Dec. 17—J. H. Newmark, former advertising manager of the Oakland Motor Car Co., Pontiac, Mich., and now with the Apperson Bros. Automobile Co., Kokomo, Ind., in a similar capacity, has written a book entitled Automobile Business: A Guide, which comes as the result of his varied experience in the sales and advertising fields. In his introduction Mr. Newmark points out that the book is for those who are already engaged in the automobile business, or who are thinking of entering this field of activity in any capacity, either as dealer, salesman, in garage work, or the business as a whole. Helpful inspiration and suggestion of better ways of doing business are the basis on which the writer attacks his problem. The publisher is the Automobile Publishing Co., Detroit.

—

New $110,000 Automobile Building for Boston

BOSTON, MASS., Dec. 20—Ground was broken this week for the erection of a new building at 683 Beacon Street, near the junction of Commonwealth Avenue, to be occupied by the Oakland Motor Car Co., Pennsylvania Tire & Rubber Co., and the John L. Judd Co., agent for Lewis VI, Allen and Auburn cars. The structure will be ready in April and will cost about $110,000. It will be three stories and basement of reinforced concrete, with all the modern devices for motor and tire business. It will be close by the Marmon, Hupmobile, Reo, Pathfiender, Regal, Peerless, Maxwell, Hudson, King and Autocar buildings.

—

N. A. C. C. Banquet Jan. 4

NEW YORK CITY, Dec. 22—The annual banquet of the National Automobile Chamber of Commerce, Inc., will be held Jan. 4 during show week at the Waldorf-Astoria.

—

M. & A. M. Banquet Jan. 5

NEW YORK CITY, Dec. 20—The Motor and Accessory Manufacturers has announced the date for the eighth annual banquet of the accessory organization. The affair which promises to excel its predecessors will be held on Wednesday evening, Jan. 5 at the Waldorf-Astoria.

—

Mt. Pleasant Co. May Move

MT. PLEASANT, MICH., Dec. 16—The Mt. Pleasant Motor Car Co., which was organized here in 1914, and which has been making the M.P. four- and eight-cylinder cars, is negotiating to remove either to Saginaw, Alma or some other city where a plant and other manufacturing facilities will be offered. Representatives of the Board of Commerce of Saginaw, were here and made some attractive propositions to have the company locate in that city, it is said.

Breaks Non-Motor-Stop Record

Maxwell at End of 672 Hr. Goes 14,261.7 Miles—21.2 M. P. H. and 22.3 M. P. G.

LOS ANGELES, CAL., Dec. 20—Stock Maxwell under A. A. A. sanction number 888, breaks world's non-motor-stop record at end of 672 hr. with a total mileage of 14,261.7 miles. The run started Nov. 22, with an average of 21.2 m.p.h., and 22.3 miles to a gallon of gasoline. Former record to be raised to 20,000 miles if motor which is now running in perfect shape can be kept running.

Chicago Fender Law Invalid

CHICAGO, ILL., Dec. 21—The Corporation Counsel of the city of Chicago told the city council that the ordinance requiring fenders on motor trucks is invalid. For several months the council has been urging the enforcement of the ordinance, which has been opposed by the Illinois Manufacturers' Association, the Chicago Automobile Trade Association, and other organizations.

It was pointed out to the general superintendent of police that the ordinance was clearly invalid because it contained a delegation of power that could not be sustained by the court.

In the law department it was found that no type or types of fenders could be definitely described for use, and the only course left was to provide by ordinance for a standard type arrived at by uniform tests. The committee will take up the preparation of a new ordinance.

36,000 Sq. Ft. Taken at Detroit

DETROIT, MICH., Dec. 17—At the meeting of the members of the Detroit Automobile Dealers' Association, space aggregating over 36,000 sq. ft. was reserved by them for their exhibits at the coming Detroit automobile show. Nonmembers will draw for space in a few days, 23,000 sq. ft. being available. Exhibitors to date total sixty-nine.

Reliance Takes Michigan Crank Shaft

LANSING, MICH., Dec. 20—The Reliance Engineering Co., which recently took over the Seager Engine Works, has now also taken over the Michigan Crank Shaft Co., which started in business here in 1907 and the Emergency Forge Co., which was started in 1910.

Decision in Tire Cover Suit

NEW YORK CITY, Dec. 20—A decision has been issued in the case of the Allen Auto Specialty Co., against E. G. Baker, alleging infringement of patent No. 799,662 on a tire cover construction, the court of appeals reversing the decision of the district court and ruling that the patent is invalid for lack of invention. The district court decision held the patent to be valid and infringed by Baker. The construction at issue applies to a tire cover in the shape of an annular tube receiving the tire from the front and having all exposed edges of the cover overlapped in the same general direction to shed water. The natural next step on the part of the Allen Auto Specialty Co. is to apply for a writ of certiorari.

Jitneys Cost Massachusetts Trolley Lines $700 a Day

BOSTON, MASS., Dec. 18—President Gordon Abbott of the Massachusetts Electric companies, which control the Bay State electric street railways and several others in eastern Massachusetts, Rhode Island and New Hampshire, has just filed his annual report in which he states that the jitney bus business is costing his roads about $700 a day. The coming of the jitney has meant a loss in net operating revenue over last year of $445,634.99.

Moline Plow's Experimental Cars Near Completion

FREEPORT, ILL., Dec. 18—The experimental work upon the automobiles to be manufactured in Freeport by the Henney buggy branch of the Moline Plow Co., is about completed. The models are under construction in Detroit and will be shipped to Freeport shortly for assembling and painting. By Jan. 1 the cars will be ready for testing upon the street. It is presumed that some changes will be made following the tests. Material is being purchased and efforts will be made to place cars upon the market early next summer. J. T. Trumble of Detroit has been secured as chief engineer.

Brennen, Hale & Kilburn Mgr.

DETROIT, MICH., Dec. 18—C. H. Brennan has been appointed manager of the Detroit branch of the Hale & Kilburn Co., North Philadelphia, Pa., with headquarters in the Garfield Building, Woodward Avenue. The Pennsylvania company makes fenders, axle housings, frames and more recently has placed upon the market a steel automobile body, also a composite automobile body.

New Jobbing House in Milwaukee

MILWAUKEE, WIS., Dec. 21—The Shadbolt & Boyd Iron Co. of Milwaukee, Wis., is entering in the automobile accessory business and is purchasing a complete stock of automobile accessories. They request catalogs, price lists, etc. from reliable manufacturers of automobile accessories. This department is to be in charge of F. H. Suter, formerly with the Chicago Rubber Co.

Russell Amalgamation with Canadian Overland Ratified

TORONTO, ONT., Dec. 21—The shareholders of the Russell Motor Car Co., at a special meeting in this city, confirmed the amalgamation of the automobile business with the Canadian business of the Willys-Overland Co., Toledo. The assets transferred to the new company were valued on the books of the Russell company at $1,000,000. For this the company receives $1,000,000 preferred stock in the new Willys-Overland, Ltd., $1,000,000 in cash and $200,000 in common stock.

To Act on Ajax Dividend

NEW YORK CITY, Dec. 22—The directors of the Ajax Rubber Co. will meet next month for the purpose of considering the declaration of a dividend.

The Ajax Rubber Co. of Millbrook, was incorporated at Albany, for $5,000,000 by C. F. Lynch and W. J. Jackson, New York, and C. L. Morris, of Jersey City.

Saxon Has 2300 Orders

DETROIT, MICH., Dec. 18—According to R. C. Getsinger, sales manager of the Saxon Motor Car Corporation, the concern had orders on hand at the beginning of December for 2300 Saxon cars for immediate delivery. It is expected that the production will be more than 2000 cars for the month, or at least 500 more than originally expected.

Oakland Salesmen Meet

PONTIAC, MICH., Dec. 16—A convention of salesmen of the Oakland Motor Car Co., is being held at the plant here this week. Between thirty and forty men from all over the country are here and will be kept busy getting posted on the Oakland sales campaign for next year, its production arrangements, and other matters concerning the Oakland company, until Saturday.

Maxwell Dealers in Session

ST. LOUIS, MO., Dec. 16—Maxwell dealers from eighteen towns in southern Illinois and eastern Missouri braved the first sleet storm of the year to-day in order to attend the annual Maxwell meeting here. The entire sales force of the George C. Brinkman Motor Car Co., Maxwell distributors in this district, acted as host to the visitors.

New York Rotarians Invite Motor Men

NEW YORK CITY, Dec. 21—The Rotary Club of New York has sent invitations to the Rotarians throughout the country to join them at luncheon Tuesday, Jan. 4, at 12.30 p. m., at the Imperial Hotel. Speakers will be chosen from the automobile industry.

Factory Miscellany

Warner Co. Adds—The T. W. Warner Co. is constructing two additions to its plant at Muncie, Ind. The estimated cost is $100,000.

Western Auto Co. to Build—The Western Auto Co., Bremerton, Wash., contemplates purchasing a site for the construction of an automobile assembling plant.

Wichita Falls Motors to Build—It is reported that J. G. Culbertson, manager of the Wichita Falls Motor Co., Wichita Falls, plans to build a factory at Dallas for the manufacture of trucks.

Wheeling Co. to Build—The Wheeling Motor Car Co., Wheeling, W. Va., recently incorporated with $25,000 capital, will establish a plant for the manufacture of its specialty. G. M. Ford is interested.

Standard Crucible Adds—The Standard Crucible Steel Casting Co., 719 Thirtieth Street, Milwaukee, will erect a foundry addition at once to keep the production commensurate with orders. The building will be 40 by 80 ft., of brick and reinforced concrete. It is to be ready about Dec. 1, at which time the foundry force will be increased to thirty-five men.

French Battery Plant Fire Damaged—The plant of the French Battery & Carbon Co., 120 South Dickinson Street, Madison, Wis., was almost totally destroyed by fire on the night of December 1. The loss is in excess of $100,000. The company is a large manufacturer of dry cells, fuses and similar material, and has been filling large contracts both for domestic and export shipment. It is considered certain that the plant will be rebuilt at once to take care of a large volume of unfilled orders.

Milwaukee Ford to Open Feb. 1—It was announced on Dec. 1 by A. W. L. Gilpin, manager of the Milwaukee branch of the Ford Motor Co., Detroit, that no further applications for employment in the new Milwaukee plant will be considered under any circumstances. There are 400 positions to be filled by the time the new shops open on Feb. 1, and up to Dec. 1 the number of applications exceeded 3100. The Milwaukee plant is five stories high, 300 by 120 ft. in size, and will have a capacity of seventy-five cars daily. It will represent an investment of $385,000.

Bates Tractor to Add—Extensive additions will be made to the plant of the Bates Tractor Machine Co., located at the corner of Henderson Avenue and Jackson Street, Joliet, Ill. It is estimated that $100,000 will be expended upon new buildings and machinery. Orders now on hand aggregate 1000 machines and it is anticipated that next season's business will aggregate $1,000,000. By increasing the capacity of the foundry, sufficient steel castings can be produced to triple the output.

Goodrich Warehouse in Kansas City—The B. F. Goodrich Rubber Co. has obtained a lease on the five-story and basement Terminal Warehouse at Twenty-fourth Street and Broadway in Kansas City, Mo., and will immediately start alterations on it for immediate occupancy. This warehouse and storage will furnish the output for the entire Central Western business of the company and will be one of three new auxiliaries to the main plant at Akron, Ohio. All business in this Western territory will now come to Kansas City instead of Akron, a total yearly of about $2,000,000. The sales headquarters here will be under the direction of F. A. Oberhue.

The Week in  the Industry

Malany Is Worcester Chevrolet Sales Manager.—H. E. Malany has been appointed sales manager of the Marcy Motor Co., Worcester, Mass., which recently took over the agency for the Chevrolet.

Hebert Studebaker Supervisor—J. M. Hebert, formerly of San Francisco, has become Studebaker supervisor at Portland, Ore.

Dealer

State California News Items—The Chandler Motor Car Co. of California has opened branches and service stations at 125 East Third Street, Long Beach, Cal., and 317 East Colorado Street, Pasadena, Cal.

Negotiations are now under way for the establishment of a branch of the Ahlberg Bearing Co., Los Angeles, Cal., in Sydney, Australia. It is planned to ship machinery for regrinding bearings under the Ahlberg system to Sydney and supply the entire Australian trade from the factory branch.

$100,000 Overland Station in Toledo—The Willys-Overland Co. will erect a service station at Adams and Fourteenth Streets, Toledo, Ohio, which will be four stories high and will cost more than $100,000.

Cleveland Changes—The Poulson Rubber & Tire Co. of Kansas City has leased a manufacturing plant at Doan Avenue and the Nickel Plate tracks, East Cleveland, where it will manufacture tire supplies. Its removal to Cleveland is for the purpose of securing a good market for its product and because of better labor conditions. It is said the company will bring 200 families with it.

The Hills Motor Car Co., 6110 Euclid Avenue, has contracted to handle the Pathfinder cars in that city and the northern section of the State.

The U-Auto-Varnish Co. has moved its general offices from the Arcade building to its new quarters at 1027 Chestnut Avenue, where an entire building is occupied. The company operates a service station in the building where automobiles are painted and varnished.

The Ris Motor Co., handling the Dort, has leased space for an additional service station, which was occupied Dec. 10.

Fisk in Rockford—The Double-Tread Tire Co., located at 319 Cedar Street, Rockford, Ill., has added car repair work in addition to vulcanizing and general tire attention. The company has taken the agency for the Fisk tires.

Motor Men in New Roles

Hawley Branches Out.—P. E. Hawley, formerly manager of the Boston branches of the Studebaker and the King, has branched out for himself as a dealer and he has taken the Saxon for Eastern Massachusetts with headquarters at 889 Boylston Street, Boston.

Henshaw Adds Territory.—C. S. Henshaw has been so successful with the Dodge Brothers' line at Boston and Worcester, standing second on the factory books in total sales, that the company has allowed him to acquire Plymouth County also. This gives him nearly all of Eastern Massachusetts from Worcester to the ocean.

Porter Resigns.—J. S. Porter, formerly factory representative for the Regal Motor Car Co., Detroit, Mich., and who formed the Porter Motor Sales Co. at Boston, Mass., to handle the Regal and Pathfinder, has resigned from the company, and W. E. Cottrell is now in charge of it.

New Men for Stewart-Warner.—L. G. Reynolds, Jr., formerly of the National Cash Register Co., Dayton, Ohio, and Ralph Kaye of New York City, have joined the advertising department of the Stewart-Warner Speedometer Corp., Chicago., Ill., to assist Advertising Manager Gridley Adams.

Eads Goes to New York.—R. I. Eads, manager of the New England branch of the Premier Motor Co. until it was given up at Boston, Mass., has gone to New York, where he will enter business with an automobile company.

Coleman, Dallas Goodrich Manager.—G. P. Coleman has been appointed branch manager for the B. F. Goodrich Rubber Co. of Texas, with headquarters at Dallas.

Hendrick, Fisk Publicity Manager.—G. B. Hendrick of Winthrop, Mass., has been appointed manager of the newly created publicity department of The Fisk Rubber Co., Chicopee Falls, Mass.

Graham Gets Detroiter Appointment.—M. A. Graham has been appointed assistant to the advertising manager, F. M. Eldredge, in the advertising department of the Detroiter Motor Car Co., Detroit, Mich.

Pacific Coast Changes.—L. B. Merton of the Pacific Coast accessory firm of Hughson & Merton has been appointed general manager of that firm, and will hereafter be located in San Francisco.

Edward Johnstone, of the same organization, has been promoted from the managership of the Portland branch to the post as manager of the Northwest territory, including Oregon, Washington, Idaho, British Columbia and Western Montana.

Hughson & Merton will shortly add another branch to their chain of stores, at Spokane, Wash., which will distribute Ajax tires and accessories throughout the Inland Empire.

Dealer

Philadelphia Jackson Moves—The Jackson Automobile Co., 822 North Broad Street, Philadelphia, has moved to larger quarters at 933 North Broad Street.

Toledo Tire Co. Enlarges—The Toledo Tire & Supply Co., Toledo, has leased additional space on Madison Avenue and by means of an archway the new store room will be connected with the present quarters on Erie Street. The basement of the two buildings will also be connected.

New Washington Tire Co.—A new company has been formed in Washington, D. C., under the name of the Ramsdell Two-in-One Tire Co., with offices at 1802 Fourteenth Street, N. W. E. H. Ramsdell, president and general manager, was formerly general manager of the Double Mileage Tire Co., Buffalo, N. Y. The company will make a specialty of making a good tire out of two old ones. The process consists of sewing two old tires of the same size together. The bead or rim of one tire is cut off, and these tires, after being cemented together with a special compound, are stitched by a patented lockstitch process.

New Simms Service Stations—The following concerns have been appointed service stations for Simms magnetos and Simms-Huff electric starting and lighting systems: The Magneto Repair Co., 32 Tennyson Street, Boston, Mass.; Brown & Caine, 1517 Michigan Avenue, Chicago, Ill.; La Fer Instrument Co., 321 Frankfort Avenue, Cleveland, Ohio; Lord Motor Car Co., 1101 S. Hope Street, Los Angeles, Cal.; Stewart Automobile Supply Co., 247 Monroe Street, Memphis, Tenn.; Wisconsin Ignition Co., 509 Cedar Street, Milwaukee, Wis.; United States Automobile Supply Co., Thirteenth and Harney Streets, Omaha, Nebr.; Carlile & Doughty, 846 N. Broad Street, Philadelphia, Pa.; Seery & Morton, 201 East Sixth Avenue, Topeka, Kan., and S. G. Hoffman of 3937 Olive Street, St. Louis, Mo.

VOL. XXXIII NEW YORK—THURSDAY, DECEMBER 30, 1915—CHICAGO No. 27

The AUTOMOBILE

NEW YORK SHOW ISSUE

TRANSCENDENCY

¶ This word of Latin origin best expresses the progress the automobile industry has made during the past year. It has been a year of unparalleled accomplishment, a year that has brought about the full realization of those many factors that have been at work during the past years—a year that has bridged the gap between theory and practice.

FOR the first time since the automobile industry attained national stature has the average price of all of the automobile models for a given season fallen below the $2,000 mark. The 1916 average is $1,600, based on 108 different makers, producing approximately 99 per cent of the output and building all told 169 different chassis models, an average of practically 1.56 model per maker.

This is an amazingly low average, one that strongly impresses itself when contrasted with an average of $2,005 for 1915, obtained by averaging the prices of practically the same number of manufacturers and approximately the same number of models. It is a reduction of $400, or 20 per cent per car.

This $1,600 average, this $400 reduction, this 20 per cent cut, is the most radical downward revision of annual automobile prices on record. The industry has known no parallel. So radical is it that we see between the figures equally radical revisions of the manufacturing processes which are necessary to accomplish such extremely mystifying results. To further grasp the magnitude of this reduction contrast it with annual reductions of the last 6 years: In 1915 the average price was $2,005; 1914 was $2,635; in 1913 it was $2,585; the average in 1912 was $2,508; in 1911 it was $2,560, and in 1910 $2,214. The latest reduction is revolutionary. These are averages not based on guesswork but on actual figures from all of the makers. The variations in price and the things which affect its use are shown in the supplemental chart bound in at page 1180.

Every engineering triumph has its reflection in the market price attached to the work upon which the concentrated thought and manual skill of the craftsman have been bestowed. It is a recognized law of evolution that one of the highest and most valuable achievements that man can rise to is to bring some hitherto unattainable article of value into the hands of hundreds of thousands of people, whose positions in life did not permit them to purchase it previously.

Last year, which yesterday passed into history, saw the vindication of many advanced ideas that have been established in the laboratory and on the floor at engineering sessions. The connecting link between sound engineering theory and practice has been forged with the result that the automobile of 1916 is a better car and costs less than ever before. And the greatest, the most valuable phase of the successful application of the principles which have been used for the past three years, is that the automobile is now within the easy reach of thousands who formerly desired, but dared not buy.

1916 Car Better Equipped

The 1916 car is more fully equipped than ever before and yet, taking the average of all those on the market, it is 20 per cent less in price. Behind this statement of facts stands a list of significant improvements in the three big branches of the automobile industry, design, manufacture and merchandising. Not only is the car a more efficient vehicle of transportation, but when sold, it is complete and equipped for any emergency that may arise. The accessories are better and, although included in the purchase price, are superior to devices of a similar nature costing two to three times as much only two or three years ago.

Prices Highest in 1914

In 1914 the peak of the price curve was reached. It was then that makers first fitted electric starters and lighting systems as regular equipment even to the lower-priced cars. These had a direct bearing on the price, and the average American car for 1914 was listed at a higher price than ever before or since—$2,635. Yet, the average car of 1916 is better than the average car of 1914 because it is better, if not more fully, equipped, it is more efficient in regard to power plant, power transmission and general design, it is more economical to the owner because it is more accessible, considerably lighter and therefore, demands far less in up-keep and running expense.

Competition the Stimulant

Competition has been the stimulant that wrought these changes. With production of many of the leading companies far up into the thousands the matter of cost per unit has had potential bearing on the success or failure of a manufacturing enterprise. Concentration on the problems of production has probably been responsible for the greatest part of the reduction in price. This concentration has meant that makers have reduced the number of models and focussed every thought on making what they did produce the best possible manufacturing proposition, as well as the vehicle which would appeal most strongly to the purchaser.

Big production of few models is the keynote of reduced price. For 1916 the number of chassis per maker is 1.56. In 1912, the number of chassis per maker was 2.17 and this has been dropping steadily ever since, as makers have come more and more to realize that efficiency in factory work means the concentration on as few parts as possible.

Standardization also has had its effect. Not only has it reduced the costs in the drafting room, but these reductions have extended to the purchasing of materials. It may be that the war will have some effect later in the year on the costs of material. It is a fact, however, that the Society of Automobile Engineers standards have reduced in so many instances the amount and variety of stock to be carried, that the price to the manufacturer has fallen.

Table of Models Listed by 97 Different Manufacturers in 1916 and in 1915, Showing by Comparison the Changes in Proportion of Sixes, Fours and Other Motor Types

Another important factor in the reduced cost of manufacture is special machinery. The adaptation and use of multiple and automatic machinery has had such a marked influence on the cost of making different parts, that it is not unusual to find where certain installations have been made, it is possible to make parts for the 1916 car for half as much as they cost in the 1915 car. The special machinery has been able to attain its utmost effectiveness because the designer has shaped the parts to be able to meet the requirements of the machine design. This is noticeably true in the handling of large or intricate castings like cylinders and crankcases. These parts, which formerly required a large number of operations in the shop, now need but very few before they are ready for the assembly bench. Cost cuts of 20, 30 and even 40 per cent in the handling of these castings, due to better design and to the use of machinery which is practically semi-automatic in its methods, are reported on every side.

Power Plants Unified

Unification of the power plant has been a potent factor in lowering the cost and reducing the price to the final purchaser. The block-cylinder casting is now used on more than three-fourths of our cars, and the unit-power plant, which for 1916 will be found on two-thirds of the chassis models, has had its effect on cost. The plain, simple exterior of the power plant means much more than accessibility and neatness of design to the owner. It is one of the big factors of the work which has cut one-fifth of the price from the 1915 car. This unification goes beyond the inclusion of motor, clutch and gearbox in one housing and extends to the auxiliaries constituting a part of the power plant. The simplification of the electric equipment, carbureter attachment, motor support and control features, is part of the movement toward making the actuating parts of the car one simple, compact and accessible unit.

For convenience in studying trends in price reductions in the complete car field, it is divided into four divisions: first, below $1,250; second, $1,250 to $1,999; third, $1,999 to $3,000, and fourth, over $3,000.

A Multi-Cylinder Epoch

One year ago, the lowest price six was placed on the market and established the beginning of a new epoch for sixes. While for 1916 the lowest price six is still the same as for 1915, $785, new epochs have again been introduced in the prices of multi-cylinder cars. For 1916, we have eight-cylinder cars selling as low as $950 and twelve-cylinder cars as low as $1,095. Below $1,250 the purchaser can select from five different chassis models of eight-cylinder cars. In this price classification, there are twenty sixes; forty-two fours and one twelve.

Although, when the average for all American cars is considered, the number of sixes remains practically the same as a year ago, the percentage of fours has dropped from 51 to 29.2 per cent and the place of those which have fallen off has been taken by eights and twelves. Nowhere is this evidenced more forcibly than in the price zone between $1,250 and $1,999, since cars selling between these figures include but five four-cylinder models, while there are eleven eight-cylinder models, and thirty-three sixes.

The fact is that, exclusive of the low-priced cars where the matter of cost of making is of paramount importance, there are more fours in higher-priced classification than in the medium. With touring models as a basis, listing between $1,250 and $1,999 there are five fours. Between $2,000 and $2,999 there are six, and above $3,000 there are nine. No other conclusions can be taken from this than that in order to make the four measure up to the high standard set by the motors of more cylinders, the maker is compelled to go to the extreme in materials and workmanship.

Both in formula horsepower and in wheelbase the 1916 car is lower than the 1915. The trend toward lower formula horsepowers has been continuing since 1912. In wheelbase the average car has remained quite stationary since 1912 until this year was reached. The average for 1912 to 1915 varied between 121 and 122 in. For 1916, it is down to 119.5. Shorter wheelbases are possible on chassis with V motors, a movement which explains the wheelbase reduction.

The horsepower change during the last year has not been so pronounced. In 1915, it was 29.97, for this year it is 28.28. In 1912 and 1913 it was 33.60.

In the lower-priced cars, wheelbase has been climbing steadily since 1910, 1916 showing a marked continuation of the trend. The average wheelbase of cars selling for less than $1,250 was 106 in. in 1915. For 1916 it is over 111 in.

While horsepower shows a slight drop, taking all chassis together, if we break up the field into sections it is seen that the cheaper cars have increased in formula horsepower while the more expensive cars have fallen. For cars costing less than $1,250 the average horsepower is now 23.67 hp. as compared with just under 20 hp. a year ago. For cars costing over $1,250 and under $2,000 the present average is 28.68 hp., a drop of a little less than six-tenths of a horsepower during the year. Above the $2,000 mark the changes have been very slight indeed. On the whole field the actual drop is a trifle over 1 hp.

Tires Are Smaller

The tendency toward lighter weight is reflected in the tire size better than anywhere else. Taking the average for all the cars, the nearest size corresponding to the figure found is the 33 by 4½. This average is due largely to the extended use of the popular 34 by 4 and 32 by 3½ sizes. Tires are smaller now than at any other time of which there is record. In 1910 and 1911, the average size was 34 by 4. This increased along with the tendency of adding more equipment to the car with the result that in 1914 the average was 35 by 4½. This has dropped in all four price classes since that time, and now the 33 by 4½ represents the average.

Another powerful influence in reducing price has been the general simplification of chassis design. By eliminating parts altogether, and by making one part do the work previously performed by several, some material has been saved, and a great deal of work. To cite a specific instance, the use of Hotchkiss drive eliminates a torque stay and all the fitting and attaching operations in connection therewith. Again, block castings save manifolds and the assembling thereof, and the details of electrical equipment have been unified and collected together into a set of parts requiring perhaps six attachments to the chassis instead of thirty-six a year ago. It might be said that while previous automobile development has consisted mainly of adding things, this year the reverse is the case.

Assembly Costs Lower

One of the conspicuous examples in which the reduction in cost during the year has exhibited itself is in the assembly department. Here the development of scientific handling of material and the application of manufacturing skill have enabled manufacturers, who are putting through their products in tens of thousands, to cut high percentages from the cost.

The number of makes included in the list this year from which our deductions have been made is 108. For 1915 it was 119 and for 1914, 133. The maximum number of makers was greatest in 1911 when there were 270. The scythe of time and competition have gradually cut the list until there are now fewer than half the number that were in business five years ago. The fact that there are fewer makers and fewer chassis models per maker, has enabled production to increase to figures that would have been impossible with conditions as they existed five years ago, and this, of course, has had a potent influence on price.

The number of chassis models on the market for 1916 is 169. In 1915 it was 200; in other words, the number is decreasing at a rate much more rapid than the decrease in the number of manufacturers. This drop in the number of chassis has been pronounced during the past year, and while there are only eleven makers less than there were a year ago, there are thirty-one fewer chassis models.

In the number of chassis produced by American manufacturers the drop between 1914 and 1915 was thirty-six. The trend toward fewer chassis however can be most marked in its early stage, when between the years of 1913 and 1914 the number of chassis decreased 103, dropping from 339 to 236.

Graphic Representation of Trends

Between pages 1180 and 1181 there is bound a folding supplement which bears curves showing all the principal trends in American automobile development since January, 1910. In this the rise and fall of the price curve is emphasized by printing it in red, and the curves showing the fall in four cylinder chassis alongside the rise in sixes are also printed in color.

Many Important Curves

The many other curves have each a relative importance. On the right half of the supplement everything illustrated has a definite bearing upon the price question. The price curve is really the result of all the others, plus increasing production.

On the left half there is a lesser correspondence between the curves, as some of them represent things which have little to do with price, but the whole series considered together give a vivid picture of American automobile development in the past six years.

Conclusions

To recapitulate: Of the factors which have made the year 1916 the greatest yet reached in price reduction, the most determining are increased production, standardization of parts, reduction in number of chassis models per maker, the use of special machinery, unification of power plant, elimination of parts by the adoption of combined units and cost cutting in manual proceses in the manufacturing plants; the last named being particularly important.

A feature which should be mentioned in conclusion is the possibility for small manufacturers to reap the benefits of large producers by purchasing parts from the prominent parts makers. Here advantage is taken of the low prices due to large production, and standardization has been carried to such an extent that these various parts can efficiently be linked together. The assembled car is thus enabled to reach the market at a practicable price figure.

Comparison of Features of the Average American Car for 6 Years

General Averages	1916	1915	1914	1913	1912	1911	1910
Horsepower, S. A. E. rating	28.66	29.97	33.2	33.60	33.60	32.7	31.5

Power Plants Are Simpler

The Trends Observed Last Year Mostly Are Continued Throughout the Period Herein Reviewed—Higher Efficiency Motors Running at Higher Speed—Detachable Cylinder Heads—Aluminum Pistons and Integral Manifolds Are High Spots—Few Motors of Old Fashioned Design Are Left—V Motors Now 12 Per Cent. of Models Listed

THE past year has been one of rapid development in design, especially among the manufacturers who make the whole of their chassis. All the twelves and most of the eights have been developed during 1915, but there are many other new motors as well, as instance the Marmon six, with aluminum cylinders, Overland model 75, the Hudson Super-Six, which is the first engine to be made in the Hudson factory, the light six Chalmers, the Buick light six, Mitchell, King and many others.

Motor Efficiency Rising

In the four-cylinder field activity has been almost as great, as motors of higher efficiency are now being made by both automobile manufacturers and engine specialists. There is the new small Overland, and many other large producers are increasing output with improved models. In 1916 as in all previous years, there will be many more four-cylinder cars made than of all other types put together.

Knight Motor Expands

Another sphere of great activity has been the Knight motor field. In the Stearns we have the first Knight engine of eight cylinders ever marketed. The Willys-Knight is the first low-priced car with a sleeve-valve motor, and Moline has put out a small four which, added to the small Stearns, new last year, makes the Knight motor output quite large, six different models.

Specialization Increasing

One of the outstanding features of the year is the increased specialization on single types of motor. There are now nine firms making only cars with V engines, including Packard, Cadillac, Cole and King, Enger, Peerless, Daniels, Standard and Ross. A much larger number now specialize on sixes, having dropped fours, such as Buick, Mitchell, Haynes, Grant, Moon and Velie. Where the greatest number of fours has vanished is from the list of cars selling at prices between $1,250 and $2,000; in this range there are more than twice as many eights as there are fours while the number of fours is less than one-sixth of the number of sixes.

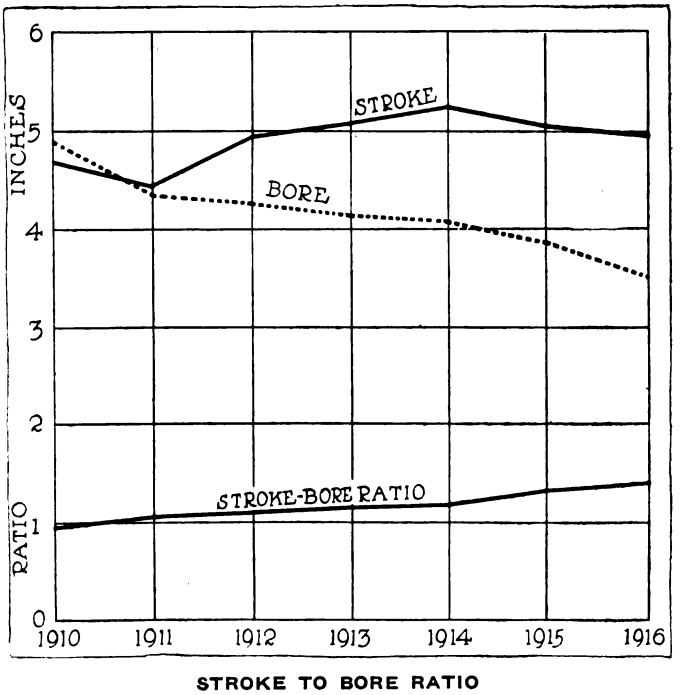
Taking the whole field of the total number of cars on the market nearly half are sixes still. In 1915 the percentage of sixes was 47.5 per cent while at present it is 45 per cent. Fours meanwhile have dropped from 51 per cent to 40 per cent and the balance, of course, is composed of eights, 12 per cent, and twelves, 3 per cent.

It is particularly remarkable that while till January, 1915, there was but Cadillac alone making an eight, there are now twenty-one different eights on the list; and with the first twelve announced in May last we have now five different cars of this type, with a promise of several more soon to appear. National and Packard appeared almost together, Pathfinder and Enger soon followed, and recently the H. A. L. has been announced.

Coming down to exact figures the average horsepower of 112 different chassis models is now 28.66 as compared with about one horsepower less a year ago. This horsepower figure means very little though, as the efficiency of motors has risen so much since the time when the formula was instituted. Probably the brake horsepower of the average motor to-day is considerably higher than it was three or four years ago. That stroke has not gone up proportionally is shown by the fact that the average piston displacement is also down a little, being now 278.87 cu. in., but stroke in proportion to bore has increased, being now 1.39 as against 1.33 last year. There are no "square" engines left as all now have a stroke in excess of the bore dimension.

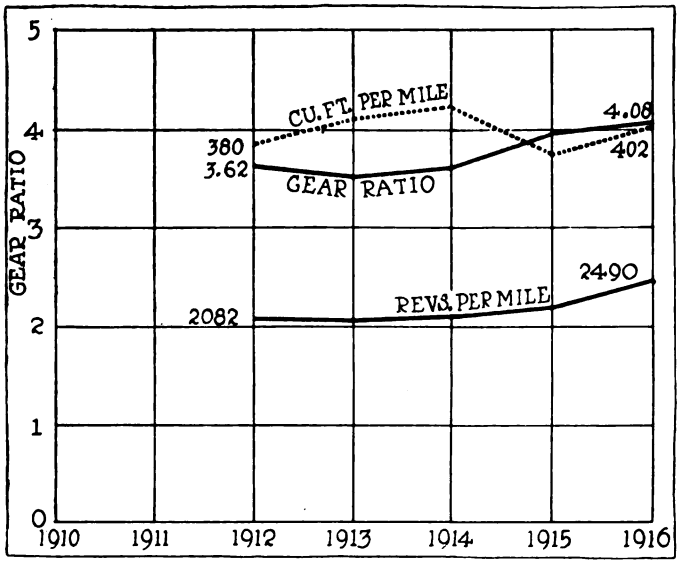
No Sign of Standard Cylinder Size

We seem to be still a long way from standard cylinder sizes, though 3 in. by 5 in. is a very popular proportion, being used on a good many sixes, and for some other types,



STROKE TO BORE RATIO

Since the average stroke of American gasoline motors first exceeded the average bore, in 1911, the two curves have grown wider and wider apart, stroke to bore ratio showing a regular and steady rise. The greatest increase in stroke-bore ratio took place during 1914 and the curve has flattened a little during the past twelve months



MOTOR SPEEDS AND SIZES

Average motor speed is best studied by working out the revolutions per mile with the average size of motor and the average gear ratio for several successive years. This process can be extended by multiplying the results so obtained by the piston displacement in cubic feet; this final figure showing the gas passed through the motor per mile of travel. It is seen that this reached a zenith in 1914, dropped heavily to last January and has risen again, by virtue of lower gear ratios, during the year of 1915. The average motor today has a piston displacement of 400 cu. ft. per mile on high gear

notably the Packard twin-six and the King eight. There are more 3 by 5 sixes on the market than there are engines of any one other size; the motor has a rating of 21.6 hp. and a displacement of 212 cu. in.

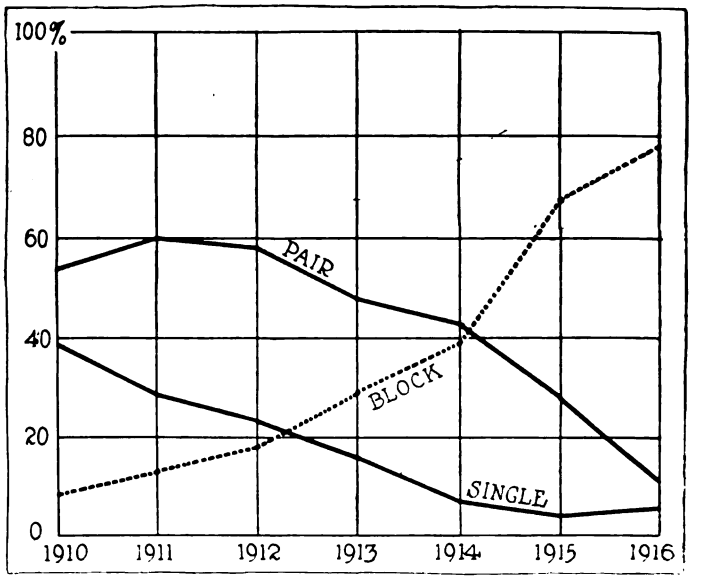
The eights vary considerably, the smallest being the Sterling motor of the Scripps-Booth which is 2⅝ in. by 3¾ in., and the largest the big Northway power plant used on several cars, notably the Cole, which is 3¼ in. by 4½ in. Still smaller eights than the Scripps may be expected and several diminutive twelves are also likely to appear during the year. It is perhaps interesting to note that the Pierce-Arrow 5 by 7 six remains the largest engine.

Certain manufacturers have made but small changes in their power plants and retain the same dimensions for the motor, prominent names in this list being Cadillac, Reo, Chandler, Chevrolet, Dodge and Maxwell. The only air-cooled car, the Franklin, has an unchanged engine, and the big sixes of Pierce and Locomobile retain the same dimensions as they had in 1914.

In all, 23 out of 108 manufacturers have not changed the motor dimensions or roughly one-fifth of the whole; many of these though, made radical changes in the fall of 1914, were in fact, pioneers in the changes that have since become general throughout the field.

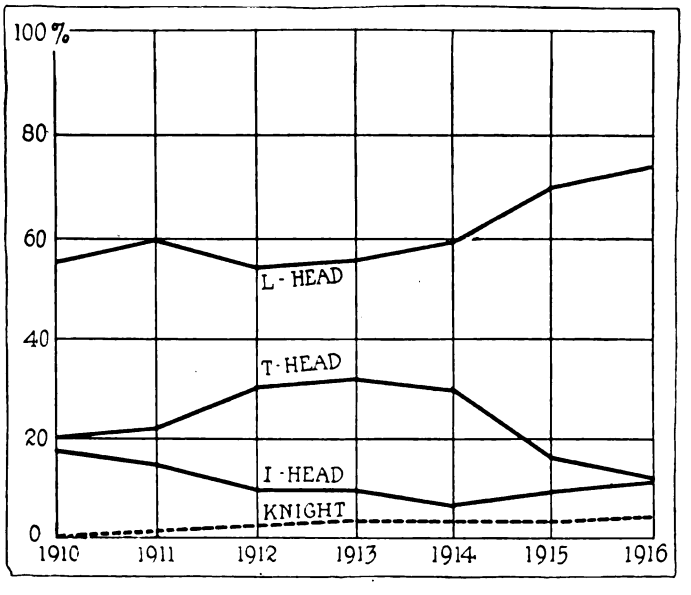
The changes in motor size are a rather interesting study, because it seems that the growing popularity of the light six has been the chief cause of the general drop in dimensions. Among the fours we have a good many examples of increased size, as instance the Hupmobile, Briscoe, Empire and some six or eight others. Meanwhile the light six which offsets these increases is characterized by the small Buick, Paige, Chalmers and Oakland sixes, there being many other examples.

Altogether there would seem to be a tendency to reduce the average difference in piston displacement between fours and sixes; eights and twelves cutting into the big six field and causing the removal of several models of large dimensions. Large individual cylinders are more common with four-cylinder cars than with cars having a greater number of cylinders.



CYLINDER CASTING

The block cast cylinder now rules four-fifths of the field. Casting singly or in pairs is almost never used for any new motor though there are a few new engines using this form of casting



VALVE ARRANGEMENT

With the Knight motor not yet a disturbing factor, it can be seen that I-head and T-head motors are now almost equal in number, while L-head is gaining on even the high spot reached last year

Few New Fours

It is noteworthy that there are very few instances of new four-cylinder models being added to any existing program, Overland and Regal being the most prominent examples, and in both cases the reason was the desire to enter a lower price field. In several cases a light six has been substituted for a four, Buick being the leading instance.

Turning to smaller detail and taking the broad average of trends as shown by specifications it is noticeable that the main tendencies follow those of last year closely. We have a distinct increase in thermo-syphon cooling, in block-cast cylinders, in unit power plants and in single ignition, while vacuum fuel feed, now a year old, has taken hold rapidly and assumed a large importance.

In valve arrangement there has been but little change, but a good deal in valve size, this being demanded by the in-

creased revolutions and increased power per cubic inch. Much lighter reciprocating parts are almost universal and aluminum pistons have been adopted by many manufacturers, Moline, Packard, Marmon, White, National, King and Cole being some who consider the advantages worth the present phenomenally high price of the light alloy.

Valve-in-Head Losing

A year ago it was expected that there would be many converts to overhead valves, but statistics do not bear this out, the I-head motor gaining but few fresh adherents, notably Marmon and Oakland, the latter with a new Northway motor. L-head construction is used by nearly three-quarters, the actual figure being 73.7 per cent, a gain of 3 per cent during the year. The popularity of the T-head motor is still on the wane, showing a drop from 16.5 per cent to 13.7 per cent during the year.

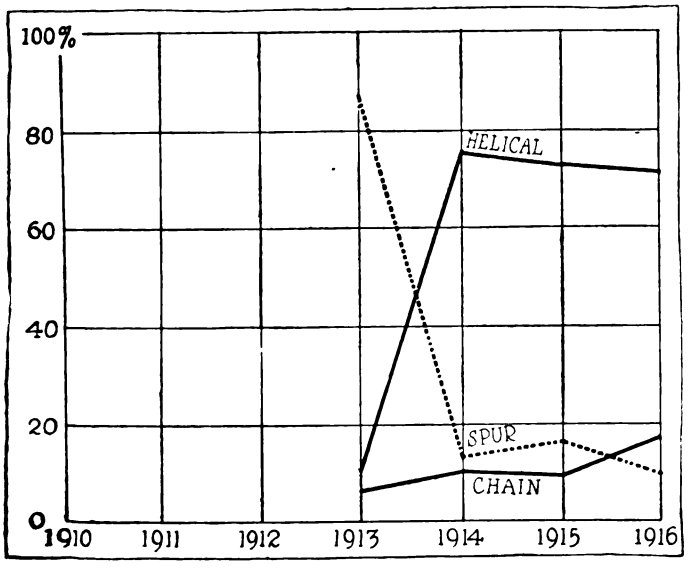
Big Increase in Syphon Cooling

Thermo-syphon cooling was a thing that was bound to increase, as it is a means for saving some cost in production. Most engines still have a circulating pump and syphonic cooling is commonest on cheap cars, but the total proportion using it is 38.2 per cent now as against 27 per cent last year. This leaves pump circulation with nearly double the number of adherents, and but very few cars are to be found with thermo-syphon that cost more than $1,250.

Single Ignition 56 per Cent

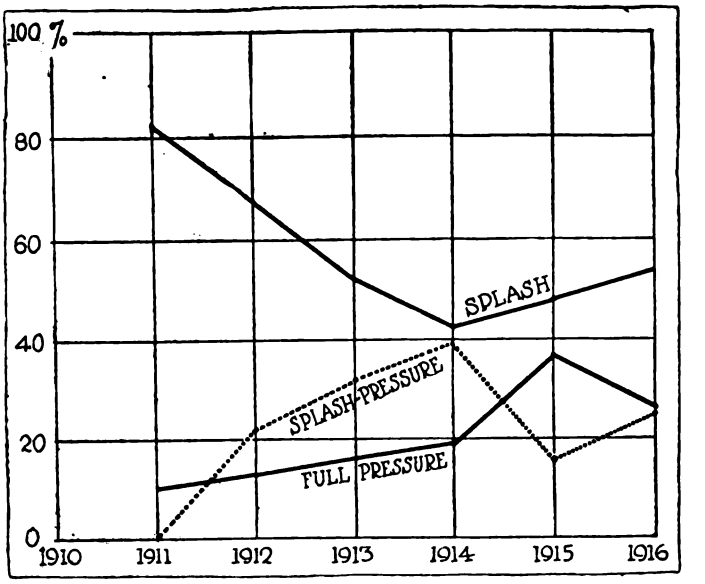
Far more striking in its way is the growing popularity of single ignition, for we note such converts as Cadillac, Buick, Hudson, Marmon, Oldsmobile, Maxwell and Stearns. The growth of single ignition shows a striking curve, since in 1913 it was used by only 15 per cent of manufacturers, in 1914 by 23 per cent, in 1915 no less than 56 per cent and to-day it is used on 76 per cent of all the cars on the American market.

More remarkable still is the fact that double ignition which was used on 68 per cent of the 1913 models now appears on only 1.8 per cent and dual ignition is consequently employed by but a fifth of the total. This is a direct testimony to the improving quality of ignition apparatus, which is all the more striking when it is remembered that electrical equipment of every kind is much cheaper to-day than ever before.



CAMSHAFT DRIVES

Though chain camshaft driving has gained 100 per cent in favor during 1915, it is still little used by comparison with helical gearing. It is interesting to notice that chain driven camshafts outnumber those using plain spur gearing, helical gears holding the bulk of the field



LUBRICATION

Last year saw full pressure lubrication at its zenith, plain splash and compound splash-pressure systems having taken away from the full pressure systems during the past year to a considerable extent. This proves splash lubrication capable of caring for the higher speed motors satisfactorily

Lubrication, classified by systems, also shows a continuance of former trend. Last year it was predicted freely that increasing motor speeds would result in a growth of the full pressure system in which oil is pumped to the main bearings and also through a hollow crankshaft to the crankpins. The percentage of chassis having force fed oiling of this sort jumped suddenly from 18 per cent to 37.5 per cent between January, 1914, and January, 1915, but the latest figures show a drop back to 23.35 per cent, so it appears that the typical American system of dip troughs for the connecting rods, in which the main crankshaft bearings are the only parts to have a direct pump supply, is capable of satisfactory working under much more arduous conditions than was at first anticipated.

Pressure feed remains most popular for V motors, but many of the high speed sixes do without it.

Though exact figures are not available, it is undoubted that crankshafts and bearings are, on the whole much larger, which means that increased rotative speeds have been offset somewhat by lower bearing pressures per square inch.

Chain Camshaft Drives Gain 100 per Cent

If the predictions concerning oiling failed to come true, those regarding the use of chain front end gearing have been fully justified, as there has been a 100 per cent increase in the number of chassis to which it is applied. The total percentage is still small, being only 18 per cent, but some of the converts are important firms such as Packard, Winton and Overland.

The condition is particularly noteworthy because whereas most of the chain employed used to be imported, scarcely any is now coming in, and the new converts to chain front ends are mostly supplied by American manufacturers.

Vacuum Feed Makes Meteoric Rise

Vacuum fuel feed, though hardly a feature of motor design, has had an effect, in that by allowing the carbureter to be placed high it has encouraged the adoption of integral manifolds which are a simplification making for efficiency and convenience in equal ratio. When using block-cast cylinders an integral manifold costs nothing extra and eliminates several parts and machining operations.

Block casting extends somewhat beyond the mere cylinders, as there are more cars than ever now w[illegible]ylinder

and crankcase in one piece, this having been encouraged greatly by the desire for rigid crank mounting and by the soaring price of aluminum. Though not yet used on a chassis the twelve-cylinder Ferro engine deserves mention as being the largest block casting yet made for automobile work, and the Northway eights in which the cylinders are in block with the two vertical halves of the crankcase. Another tendency in casting, which is of paramount importance to the user, is the detachable cylinder head, which is part of almost every motor added to the list during the past six months.

Detachable Cylinder Head Improved

In early days the detachable head was a nuisance because the gaskets gave trouble, but the creation of the modern copper and asbestos gasket has solved the problem and allowed the advantages of the separate head to be obtained without any drawbacks.

Accessibility Much Better

Very much improved accessibility is also to be observed, this being due first to simplification of the main parts of the powerplant and secondly to much better arrangement of the accessories. High placed carbureters have helped a great deal, and smaller electrical units have also assisted to no small degree.

Three-Point Suspension Gains

Among ways for attaching the motor to the frame, three-point suspension is almost always used when the motor is a specialist's production and assembled by the chassis builder, but rigid attachment that makes the crankcase a strength-giving part of the frame is still common with the expensive cars, particularly when the motors are very large.

Unit Power Plant on Packard

Following the trends of several years there is a continued increase in the use of unit power plants, the most noteworthy fact in this connection being the conversion to this system of some of the manufacturers who have held out longest. Packard, Winton and Peerless are three prominent examples.

Packard, having been so consistent a supporter of the rear axle transmission is a specially prominent example of modern trend in this respect.

The form of transmission unification where the gearset is located at the *front* end of the torque tube has one new adherent in Marmon.

Some New Materials

The growing use of aluminum pistons has been mentioned, but this commentary would be incomplete without mention of the aluminum cylinder which makes its first appearance on the actual market at the New York show. That there would have been many such motors had the price of aluminum not soared so high is unquestionable, that there will be many when the price drops again is assured.

The aluminum piston has, by its success on road and speedway, silenced talk about the steel piston, at least for a time, and it has had the effect of causing engineers to pay close attention to the weight of iron pistons, so that many cast-iron designs are now extremely light in weight.

Tungsten Shortage Serious

In the steel world the outstanding thing which has affected engine construction is the shortage of tungsten, which has made it difficult to extend the use of tungsten steel for valves. Thus some makers are using tungsten steel for the exhaust valves and nickel for the intake valves while others are using various sorts of nickel for all valves. Crankshaft and connecting-rod steels have changed but little.

It is notable that brass has almost vanished from the power plants of 1915, integral manifolds, block cast cylinders, cast-iron cylinder headers, and the wider use of aluminum has cut down the brass parts to a minimum. On many motors practically the only piece of brass is the carbureter. Even water pumps are being made in aluminum now in fair quantity, so cast iron and aluminum may be said to have absorbed the brass between them.

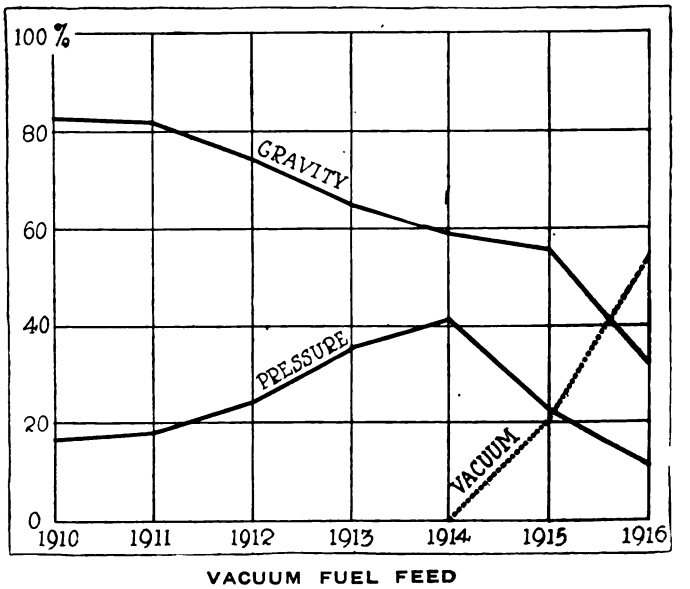
Owner's Convenience Studied

Partly owing to its greater accessibility, partly to its better simplicity and partly to the greater durability given by better materials and better proportions, the engine of 1916 is likely to be distinctly less trouble to maintain in good condition than its predecessors. In one respect it probably has not gained anything, and this is in liability to deposit carbon. When the efficiency of a motor is increased its liabilty to carbonize is increased also, because the temperature of combustion is greater, but this is offset by the much better piston design that is now the rule. Simultaneously the use of smaller cylinder bores makes it less work to remove a set of cylinders for scraping, and the motors with detachable cylinder heads can be dealt with very quickly and effectively.

Probable Future Developments

On the whole, it is hardly likely that the designs of 1917 will show, on the average, so much difference from the present ones as do the latter from those of 1915. The year just closing has seen a general levelling up to a high standard set by sundry pioneers in 1914, factories have been reorganized to suit the new designs, and large outputs planned for the 1916 models. Under such circumstances it is not likely that the main features of next year's motors will differ very greatly from the characteristics here reviewed. Of course there will be changes, and it may be that they will transpire more important than present conditions suggest, but the general advance has been so immensely rapid in the past twelve months that it is unreasonable to expect a continuance of development at anything like the same pace.

In conclusion, the one big trend is to simplification. Reduction in the number of parts, simplification of the parts themselves, and better arrangement of everything. The gasoline motor is an agglomeration of pieces which have become co-ordinated but slowly; to-day the process has advanced much further than a year ago, though there is no statistical method for showing it.



VACUUM FUEL FEED

These curves show how pressure fuel feed that was gaining rapidly in 1913 and 1914, was dispossessed by the vacuum system; the latter gaining support in so vigorous a way that pressure feed has fallen to an extremely small proportion

Spiral Bevel Features Transmission

Coming of New Type Drive Gear the Outstanding Happening of 1915—Clutch Changes Little, But Disk Now Well in Lead—Fewer Four Speed Gearboxes—Hotchkiss Drive Gaining Fast

PIRAL bevel drive is no doubt the big feature of development for the 1916 transmission system. Other features of the driving units have not shown any very ked trend except perhaps the Hotchkiss system which is gaining rapidly in popularity. Although with the two ible exceptions noted, there has been no radical develop- t in driving and torque systems, still the transmission 916 is more efficient than that of 1915, due to improve- ts in manufacture and to the better application of ma- ery in particular instances.

ıe manufacture of spiral bevel gears calls for expensive ıinery which was in its early development in 1914. This now passed its preliminary stage and 1916 cars which fairly low on the price scale are using it. The big gain ıpiral bevel drive may be appreciated from the statement fifty-two makers are using it this year who did not em- it for 1915. The percentage of cars using it is now 56.8; than half, whereas, for 1915 the percentage was only Some of the cars which used it for 1915 and may be ed as among the pioneers of the movement are Cadillac, ɔon, Franklin, Marmon, Packard, Peerless, Jeffery, Kline Stearns.

Spiral Bevel Converts

nverts have been made to the spiral bevel system because quiet, but nevertheless efficient. Tests made by repre- ıtive concerns have failed to show any appreciable loss ɔwer through employing it, and those changing to its ;his year include many well-known names such as Ap- ɔn, Buick, Chalmers, Chandler, Cole, Haynes, Hupmobile, ɔon, King, Locomobile, Mitchell, Moline, National, Oak- Reo, Saxon, Scripps-Booth, Velie and Winton. The list of those who have changed to this type of drive s this one of the big movements of the year.

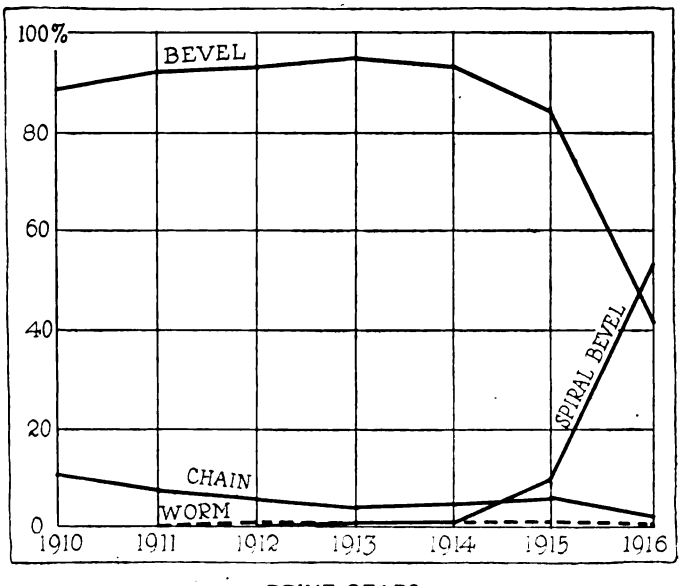
e development of the clutch shows that we have reached re or less stationary period. Since 1913 there has been change, the disk clutch percentage since this time hav- emained somewhat in the ascendency over the cone, but ery far from it. Perhaps the abandonment of the band- of clutches is about the most interesting. Apperson ı contracting band clutch which was fitted to their cars period of several years. This season the Apperson is with a plate design. Haynes, another pioneer, which ɛmployed the contracting band type has also used the design for 1916. These two concerns which are among ldest in the country have brought the percentage of ıcting band clutches down to 0 by making the change. ɛxpanding band clutch which was used by Peerless on f their models for 1915 has also been abandoned and in ıce the disk alone is used. The total percentage of disk ɛs of all types for 1916 is 53.4. For 1915 it was 51, for it was 48 and 52 for 1913. The cone clutch percentage 3 for 1916 and was 44 for 1915, 41 for 1914 and 45 for In 1912 the cone clutch led the disk clutch, having 52 ɛnt to its credit while the disk had but 44. The Owen- ɛtic drive introduces for the first time the electric or ɛtic clutch feature.

The increase in the use of unit power plants has been mentioned, but it has another effect in the promotion of accessibility in the gearbox control lever. This can now be mounted on the cover of the gearbox and when this is done provides a simple and accessible layout which results in a neat appearing driving space in the car. The shifter lever projecting through the floorboard close to the front seats is not coupled to a mass of linkage which promotes noise, but, on the other hand, forms a solid unit which is very much favored on 1916 cars.

Gearsets Little Changed

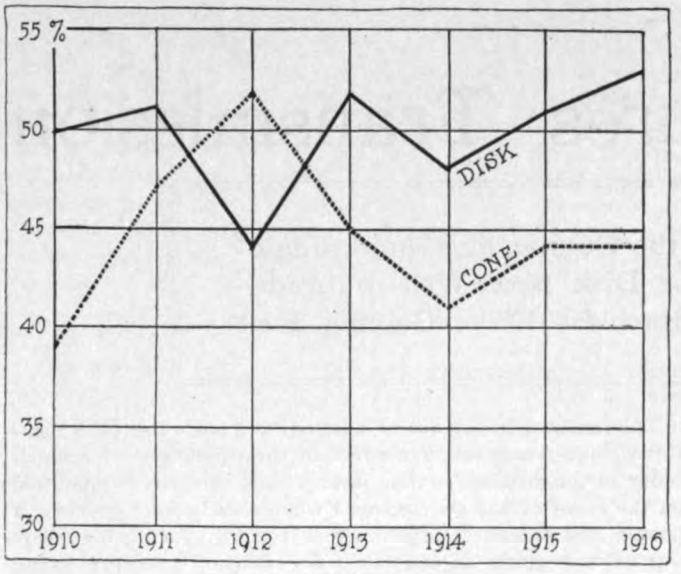
Although the trend is toward unit power plant, the assembly of the gearset in itself has not changed very radically. Shorter shafts due to more compact design is noticeable in a few of the standard designs and the decrease in four-speed drives has also been responsible for a smaller and more compact average gearbox. The number of four-speed gear boxes reached its highest percentage in 1914 when 29.5 per cent were so equipped. For 1916 the percentage dropped to 23.5 and for 1916 it is down to 15. The three-speed gearbox is used in 82 per cent. Some of the cars which during the year have abandoned the four-speed gearbox are Abbott, Davis, Hudson, Kissel, Pathfinder, Peerless, and Willys-Knight. Beside these, there are other companies such as Chadwick and S. G. V. which are no longer listed.

Hotchkiss drive, in which both the driving stresses and the torque are taken through the springs, is now used on 37 per cent of American cars. Some of those who used the Hotchkiss drive in 1915 are Oakland, Stearns, Apperson, Hudson, Haynes, Cadillac and Mitchell. For 1916 some important



DRIVE GEARS

The spiral bevel drive looks to be well on its way to become universal. Worm gearing on gasoline passenger cars has never taken hold, and the straight tooth bevel is being displaced just as fast as the machines for cutting spiral bevels can be delivered



CLUTCH VARIATIONS

These curves of cone and disk clutch proportional representation exhibit a slight trend toward the disk, but they also show that there is no settled opinion. It is not possible to account for the variations by any engineering reason, and the only reasonable conclusion is that either type gives perfectly satisfactory service

names have been added to the ranks, among these being Chalmers, Hupmobile, Maxwell, Peerless and Stearns. This type of drive dates back in America to the Savannah race of 1908 when Apperson had a car using semi-elliptic rear springs in which both the drive and torque were taken through these units.

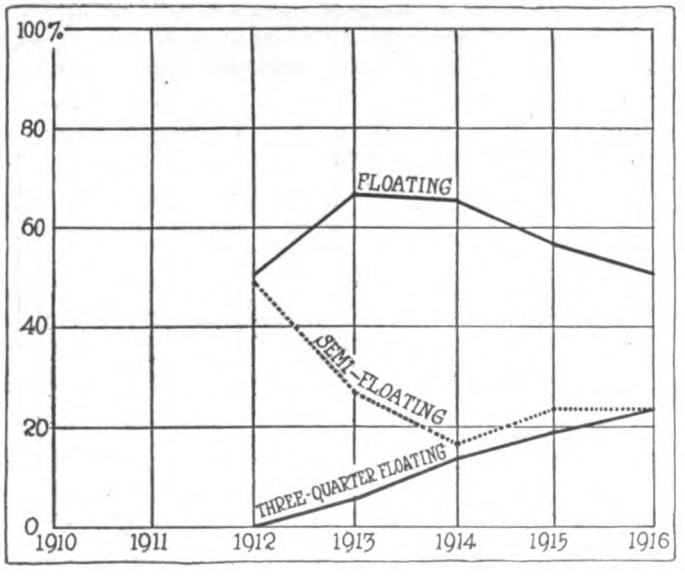
Rear axle design presents an interesting study. There has been considerable argument during the year regarding the merits of semi-floating and floating types, but the ideas of makers are not changing very rapidly as is shown by the fact that no wide variations are to be noted in the number of percentages of installation. However, the three-quarter floating axle which had its inception in 1913 continues to gain and is now used on 22.8 per cent of all makes. The floating design still is by far the most popular having 51.8 per cent. This is less than last year by 5 per cent and much less than in 1914 when 65 per cent of all axles were floating. The peak of the floating axle curve was in 1913 when 67 per cent were so equipped.

Better materials are used in axle construction than ever before. The alloy steels are employed in cars of lower price classification than in previous years and it is not exceptional to find cars listing at less than $1,000 fitted with chrome-nickel and vanadium steel shafts and gears.

Left steering with center control continues to progress in popularity. The percentage of chassis having this type of drive and control is now 87.1 or in other words about seven-eighths of the total. Right steering and right control is used on 6.8 per cent. Concerns which continue to employ the latter are falling off year by year and whereas in 1910, 93 per cent used right drive and right control, the makers who employ it now are reduced to seven. They are Dispatch, Fiat, F. R. P., Morse, Pierce, Simplex and Stutz. Several of the makers who are doing an export business make a practice of putting out a model with right drive and right control to meet the needs of foreign trade, and there are a few also who offer an option to the purchaser in the matter of steering wheel location. Briscoe and Saxon are examples of such. The little Vixen car has center steering.

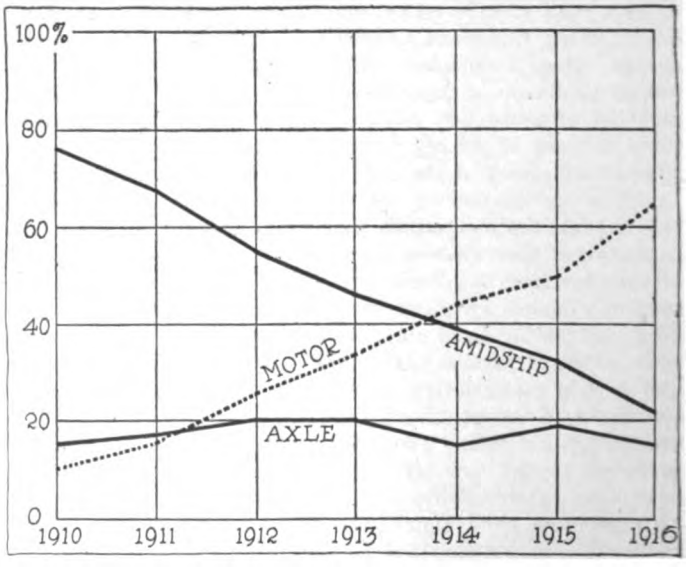
The wire wheel position is not shown properly by statistics. During the year there has been a very large number of wire wheels fitted to high class cars, and they have been standardized by such firms as Marmon and Stearns. On many other good cars they are optional equipment and the option is being exercised by a fair proportion of buyers. The use of wire wheels on small, low-priced cars is decreasing, for the time, but the gain in the better class field much more than compensates for this. The position has been created by the coming of really good wire wheels with a satisfactory demountable hub design.

One of the features of the 1916 car is the neat arrangement and accessibility of the control mechanism, both the electrical and mechanical. Manufacturers have simplified the arrangement of the instruments on the cowl board. The manufacturers of electrical apparatus have improved the appearance of the switches during the year and in some cases have brought out simplified models.



TYPES OF AXLE

The full-floating axle now holds just about half the field of American made cars, and the remainder is divided between the semi-floating and three-quarter-floating designs. The rise of the three-quarter type is most remarkable, and it appears, from the curve, that the semi-floating type is on its way back toward the position occupied in 1912. The most interesting field for speculation is the future of the three-quarter-floating design



GEARSET LOCATION

Rear axle transmissions have never held a large part of the field, and the percentage they occupy has changed but little during the past five years, though there is a distinct drop in the past twelve months. The rise in unit powerplant construction and fall in amidships location for the gearset have continued in an almost straight line curve since the crossing point in 1914. Now, approximately two-thirds of American chasses have unit powerplants

Electrical Systems Simplified

Single Ignition and Two-Unit Lighting and Starting Equipments Are the Big Trends Seen in the 1916 Models—Generators Are Simpler and Neater—Attachment to Motor Is Being Brought Towards Standardization

WITH the advent of electric starting and lighting a part of the equipment of every car, regardless of price, the electrical phase of car design took on an im-tance which has grown constantly during the past three rs. It was in 1912 that automobiles first began to be ipped with electric lighting and starting as standard. ong the 1912 cars but 2 per cent were so equipped. The owing year, 1913, saw the commencement of the landslide ard electric lighting and starting. In that year 37 per cent starting and lighting systems operated by electricity. years of 1914 and 1915 brought the percentage of in-ase rapidly upward, the steps during these two years being 7 per cent and then 94.5 per cent. Finally, for 1916, 98.8 cent have electric lighting and starting. Ford, Vixen Woods Mobillette are those without.

uring this rapid fire development of electrical equipment, e have been two outstanding features upon which it has n necessary constantly to work in order to make the im-vements of the utmost value to the automobile manu-urer and the car user. First, the systems themselves e had to be rendered more efficient and simple and sec-ly, the application of the electrical equipment of the car had to be more workmanlike and rendered more a part of complete unit than simply an added set of accessories d ever be.

elopment In Four Years

he first lighting and starting systems which appeared at show in New York in 1912 were merely tacked on after car itself had been completely built. Even the small ıber shown there were sufficient to cause an immediate lic demand that cars be equipped with lighting and start-systems. The result was that, although motors had not viously been designed for electric lighting and starting, endeavor was made to put on the devices in the quickest easiest way. Ever since that time, the trend of develop-t has been toward not only improvement in the devices nselves, but to improve the rough and ready installation hods which were but natural when the hurried manner in ch the first applications were made are considered.

n other words, development in electrical equipment has n along mechanical and electrical lines, and this has not been confined to electric lighting and starting, but also gnition. Principally in the battery ignition field which re-ed an impetus with the installation of the generator as dard equipment.

-Unit Systems Gain

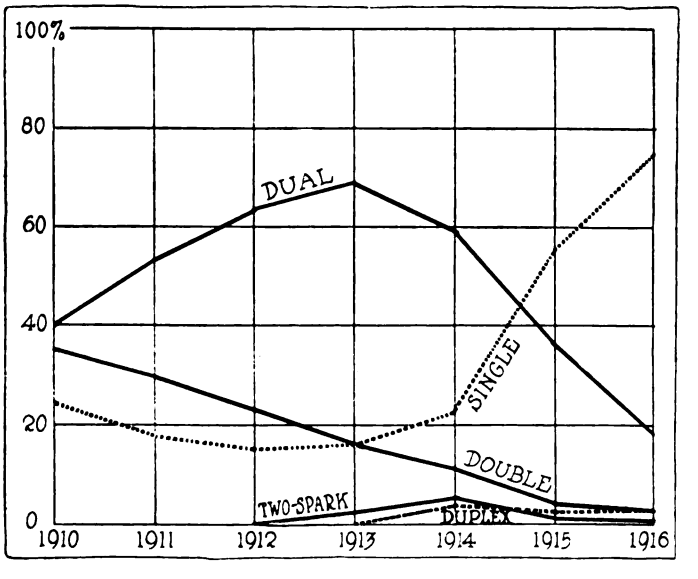
robably no phase of electric lighting and starting sys-s is more noticeable than the tendency toward two-unit ems, in which the generator and starting motor are sep-e for the smaller and lower-priced cars. The single unit em has been developed to a high state of efficiency, but he whole, the trend is strongly toward two units.

echanically, the most noticeable change for the better has been in the connection between the starting motor and the engine. The Bendix gear has proven to be a success and many other and more complicated methods of connection between the starting motor and the engine have been abandoned during the year.

Lack of standardization has been one of the stumbling blocks over which electric starting and lighting manufacturers have had to fall in the past three years, and it is only this year that some workable basis of standardization is beginning to shape itself. Better wiring and less attention on the part of the driver are the two aims for development as far as the user is concerned, and along the line of better wiring, the tendency toward the single wire or grounded return system, has reduced the trouble and expense of upkeep materially.

Single Ignition 75 Per Cent.

The development of ignition has gone hand in hand with the simplification of other parts of the electrical system. Single ignition is now used on more than three-quarters of all chassis, the actual percentage being 76. Dual ignition, which at one time was far in advance of all others in popularity, is now down to 19.2 per cent and the small balance is made up by two spark ignition, 1.2 per cent, double ignition, 1.8 per cent and duplex, 1.8 per cent. In 1911, 1912 and 1913 the percentages for dual ignition were respectively, 53, 63 and 68 per cent. In 1914, it dropped to 59 per cent and 1915 it was down to 36 per cent.



SINGLE IGNITION GAINS

Single ignition has made a seven-league stride for a second year, though the pace has now dropped a little. Double and two-spark ignitions are now hardly used at all and the popularity of the dual system is on the wane. This is the most striking testimony to the reliability of single ignition systems, whether magneto or battery

Stutz and F. R. P. are the exclusive examples of two-point ignition, and double ignition is used by Pierce. The Bosch vibrating duplex system is coming in for some attention and one of the cars which has adopted it is the Winton. Although dual ignition is falling off in the percentage table there are still a number using it. For example: Apperson, Case, Cole, Fiat, Haynes, Locomobile, Moline, Oakland, Peerless, Simplex, Stearns and Velie.

Generator installation has greatly increased the use of battery ignition system, and it is now used on 62 per cent of all makes. All the eight-cylinder cars have battery ignition and three of the twelves. Typical examples of new adherents to battery ignition are Packard, Abbott, Apperson, Briscoe and Chevrolet.

The steps by which single ignition has increased are shown by the respective percentages for 1912, 1913, 1914 and 1915 which are 15, 23, 56 and 70 per cent.

Mechanical and electrical efficiency in ignition systems have been made extremely necessary by the increased speeds of rotation of motors and by the increased number of cylinders. Both factors which are interpreted to the ignition manufacturer in the terms of more sparks per unit of time. The big tendencies in ignition improvement are faster breaker mechanism, more rapid coil action, better timer mounting, ignition for motors up to twelve cylinders, perfected synchronism, short high-tension leads, neater and more compact switches and better protection against water.

Another development which has been continued by practically all the leading battery ignition manufacturers, is automatic advance. Realizing the wide speed ranges of present day motors, ignition manufacturers have been driven to the belief that it is impossible for the average driver to keep the spark position continually at its most efficient location. In order to compensate for the spark changes necessitated by the rapid acceleration, it has been felt by the majority of these manufacturers that the answer lay in the use of automatic advance.

Where it has been necessary to provide ignition for twelve-cylinder motors which are run at high speed, the skill of the ignition manufacturer has been taxed to a greater extent than ever before, but success has been met in this field by the use of double breaker boxes or by breaker mechanism in which the inertia element has been overcome to such an extent that the critical speed of the ignition instrument is in excess of the utmost demands of the multi-cylinder V-type motor.

Carbureters Meet V-Motor Requirements

Side Outlet Types Conform to Block Cylinder Design—Vacuum Feed Allows Higher Mounting—Quick Acceleration

BROADLY speaking, the biggest factors in the carbureter industry for the year 1915 have been in the developments necessary to meet the demands of the big production companies and at the same time meeting the difficult requirements necessary in handling the present day fuel and still supplying the quick acceleration now demanded. Vacuum feed, higher rotative speeds, the extended use of eight and twelve-cylinder motors and the integral manifold have all been developments of the year which have had their effect on carbureter design. The side outlet carbureter which has now been standardized by the Society of Automobile Engineers has also been developed and has found favor with car manufacturers who desire a clean motor exterior.

Vacuum Feed a Factor

Vacuum feed and the integrally cast manifold have gone hand in hand in permitting the carbureter to be mounted higher on the motor than ever before. This shortening of the intake manifold has eliminated the question of condensation which with the heavy grade of fuel has bothered both carbureter and engine manufacturers. With the question of condensation removed it has not been found as necessary to waterjacket the carbureter as formerly predicted and the hot air intake pipe has been relied upon to perform the work.

The concerns which make their own carbureters for 1916 are Cadillac, Cameron, Fiat, Franklin, Hudson, Kline, Lenox, Locomobile, Peerless, Packard, Pierce Arrow and White. This list is about the same as for 1915 the notable addition being Hudson which in the new Super-Six makes its own carbureter. The Kline is also now equipped with a carbureter made by the Kline concern. There are several concerns, also, like Dodge, which have special carbureters made to their own design in carbureter works.

During the year the Zenith company brought out a new model designed particularly for eight-cylinder cars. This is a duplex design which follows closely the ordinary Zenith construction but has two mixing chambers, two outlets to the intake manifold and two inter-connected throttles. This specialization has had good effect as may be noted from the fact that the Zenith is used on the Briscoe, Daniels, King, Mitchell, Ross, Scripps-Booth, Standard and Stearns eights and on the Enger twelve. The Stromberg carbureter is used on the Cole and Oakland eights and on the Pathfinder twelve. The Partin-Palmer eight uses a Rayfield as does the National twelve while the Oldsmobile uses the Johnson carbureter, the Cadillac on its eight uses its own carbureter and Packard on the twin six uses a Packard carbureter.

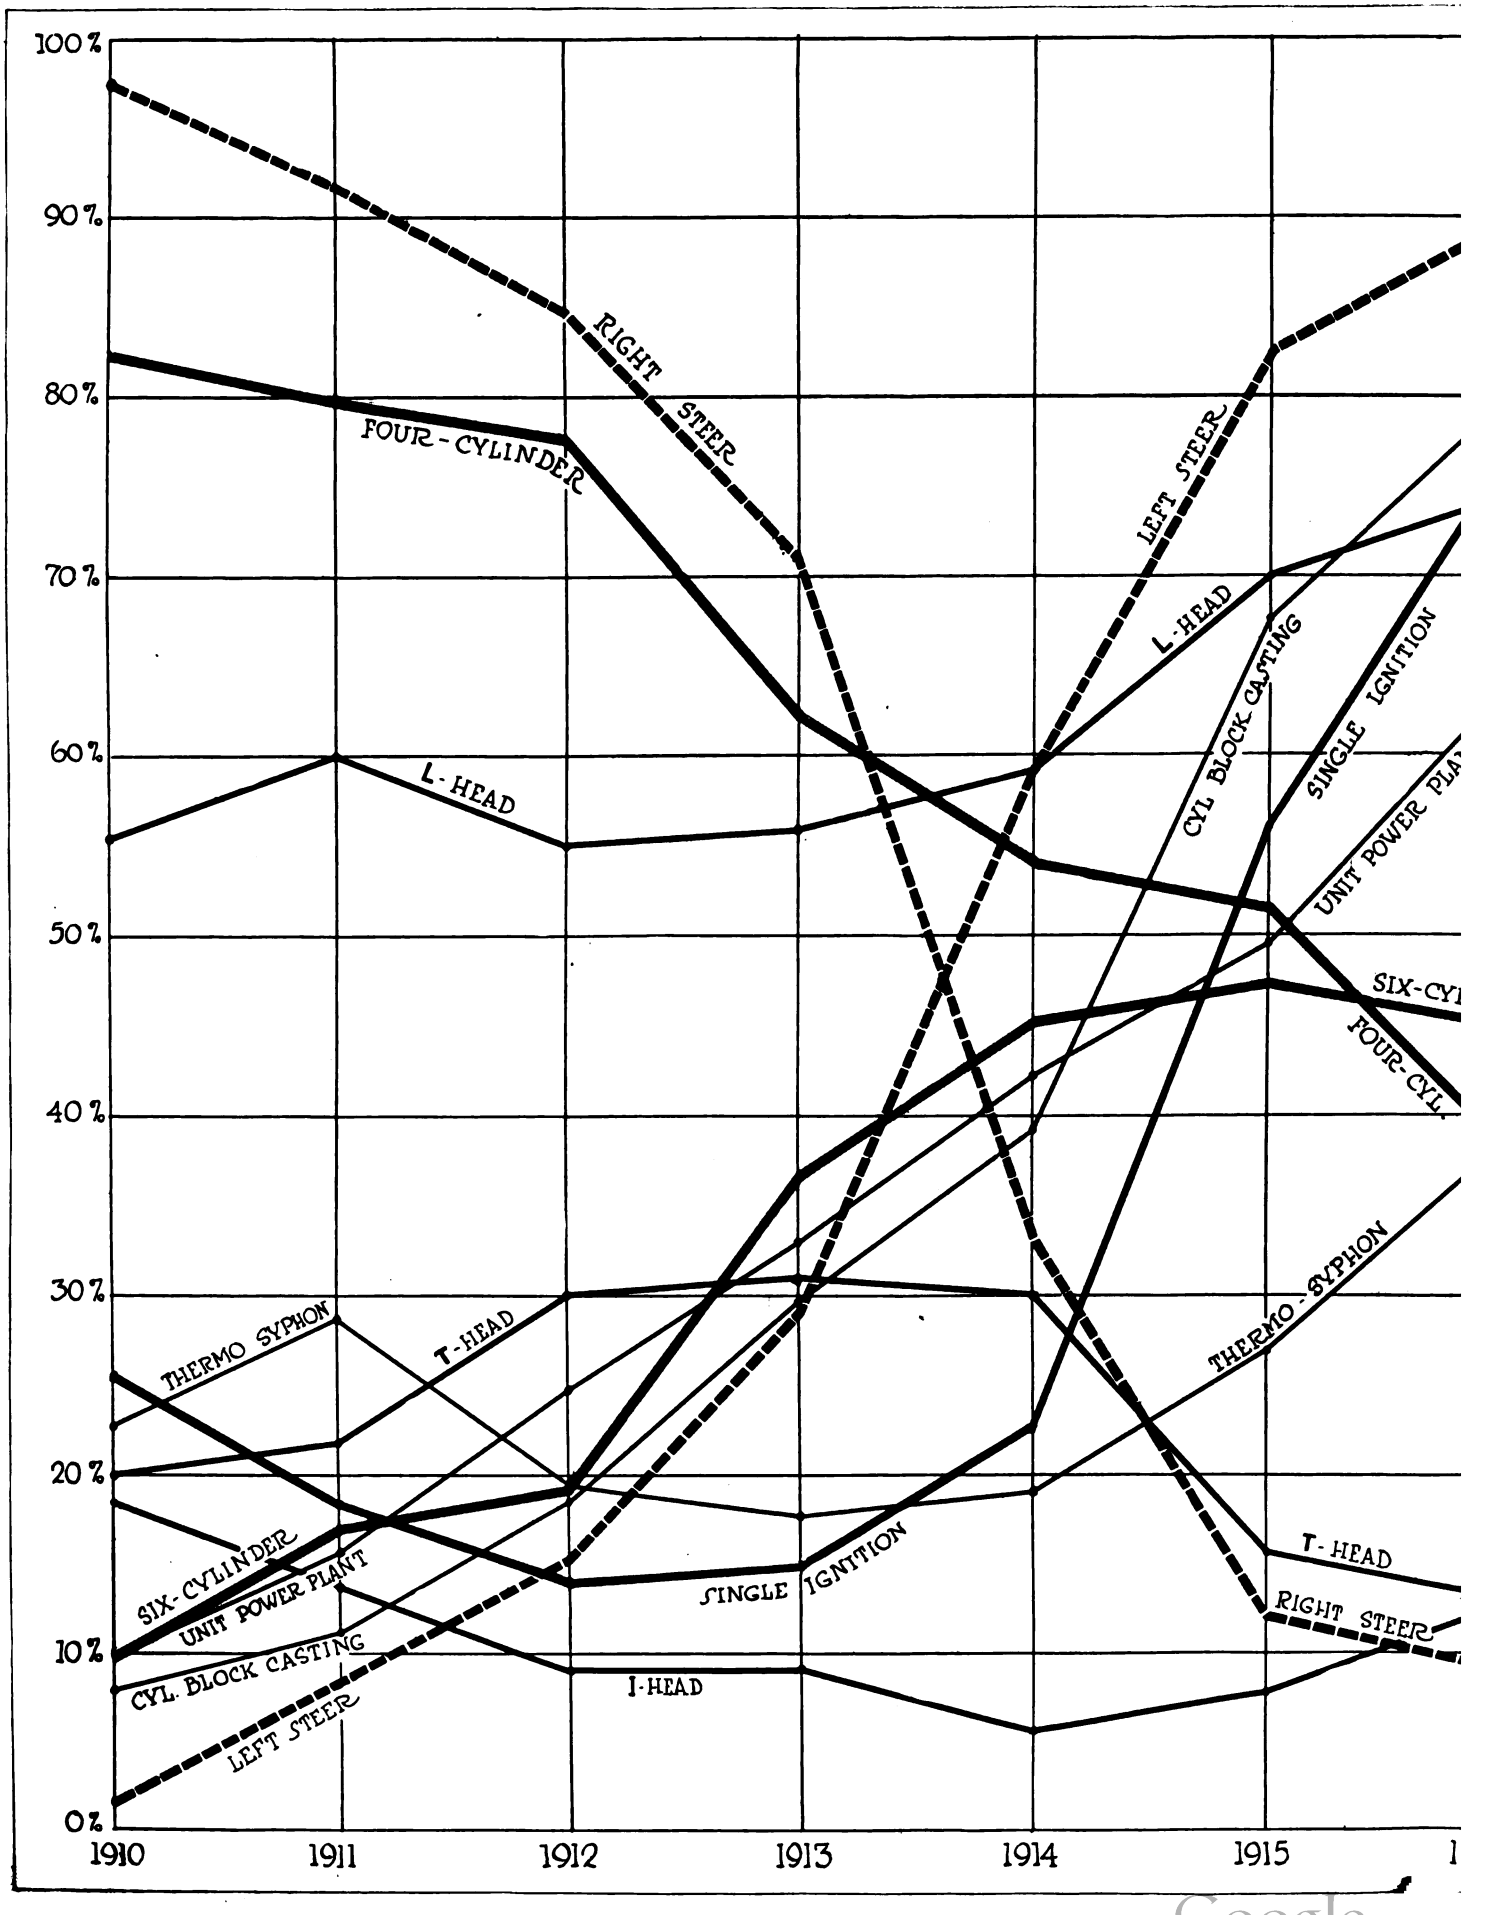
In March, Schebler brought out a new carbureter to succeed the model R which differed from the previous design in that the metering pin opens the jet by moving downward instead of upward. The carbureter is also featured by a long extension on the venturi which is new practice for the Schebler company.

Greater Gas Velocities

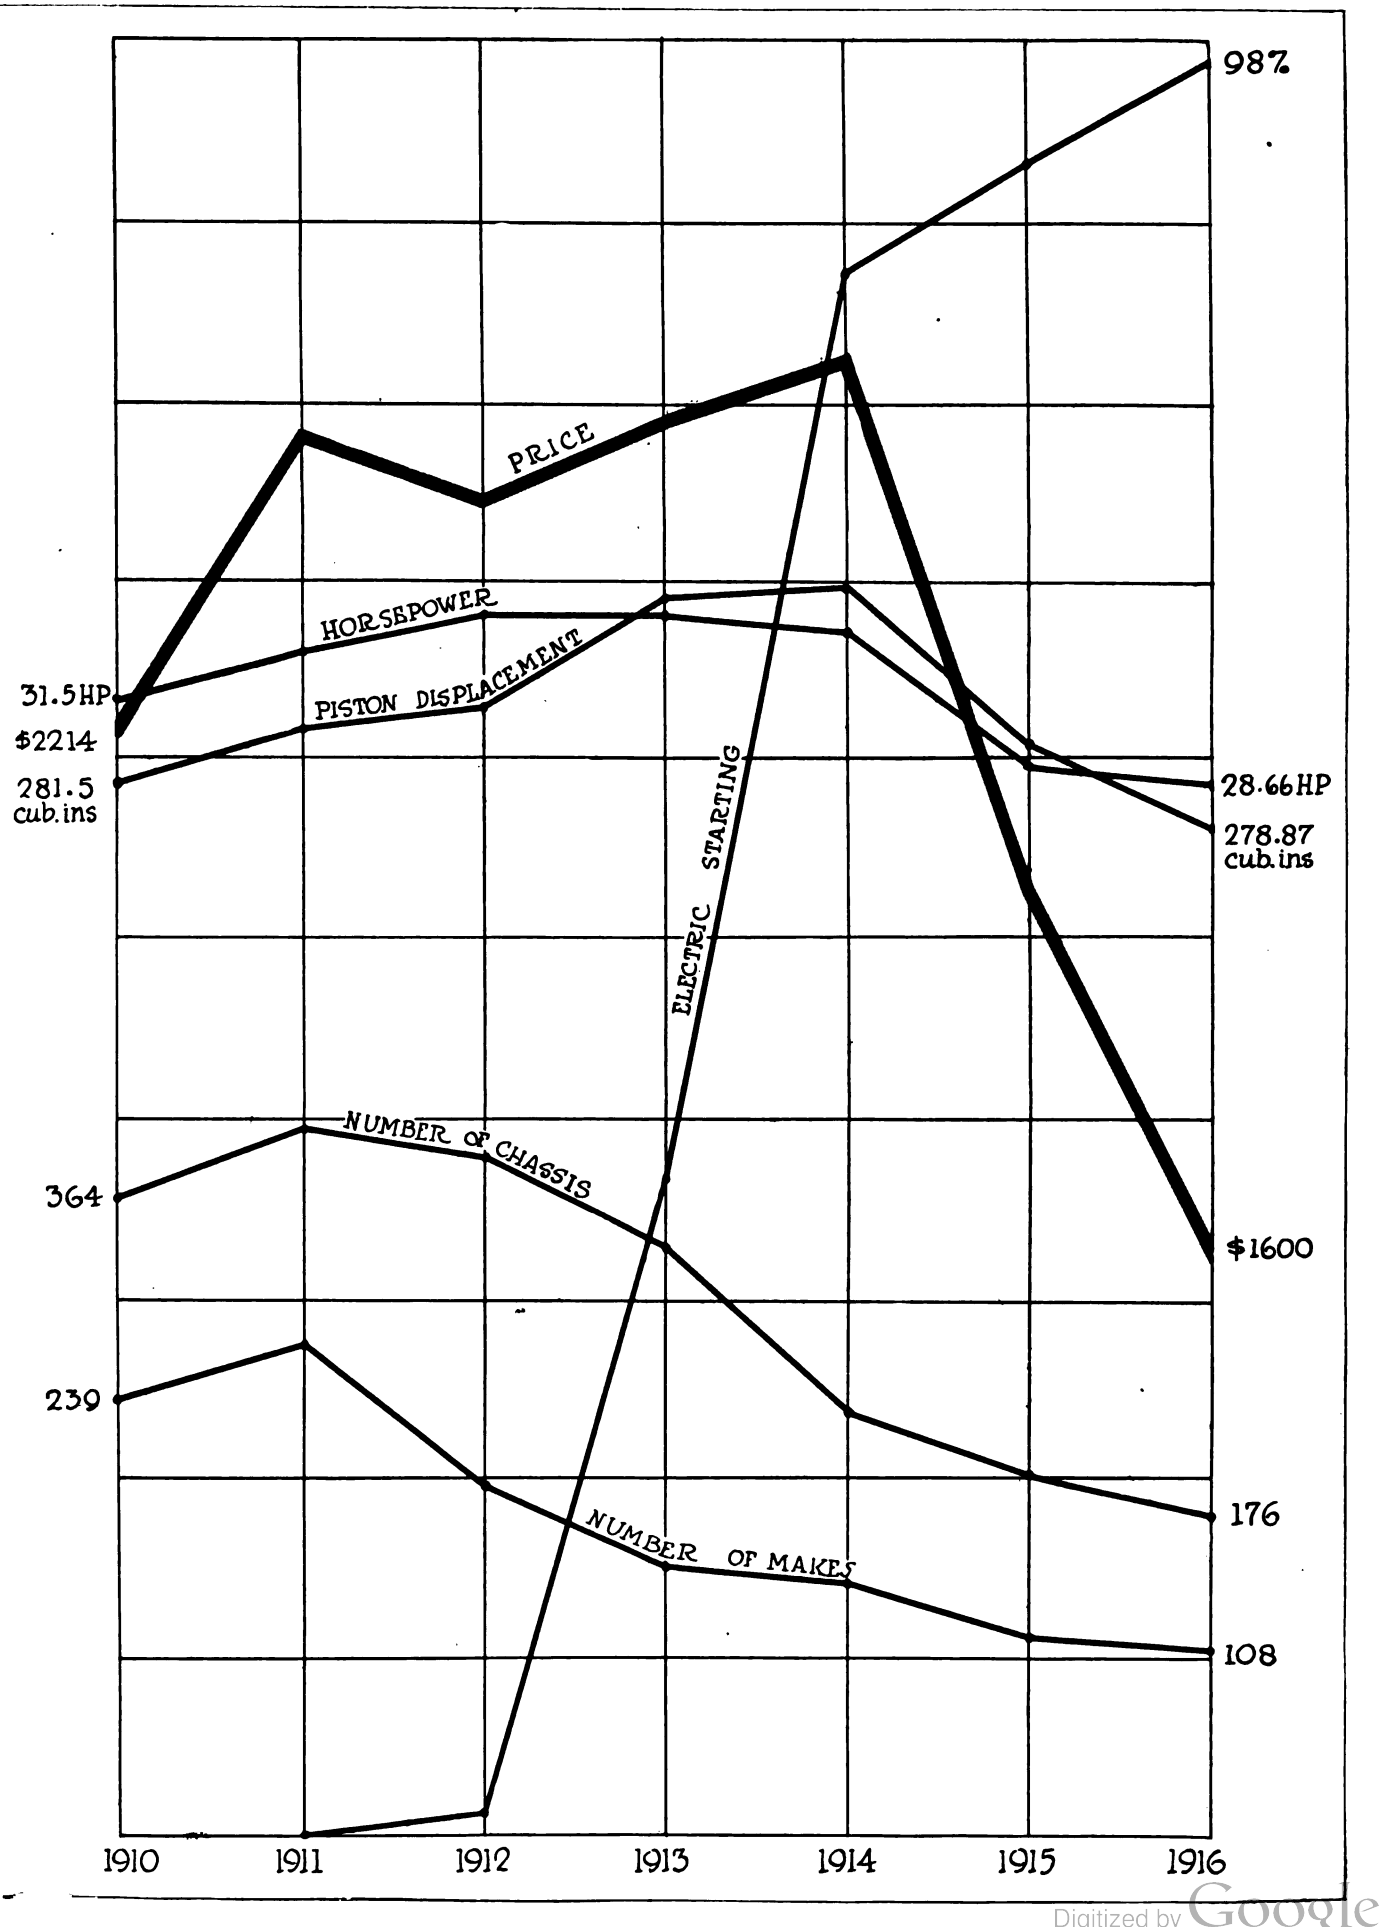
The higher speeds of motors have called for greater gas velocities in order to accomodate the increased displacement per minute in the cylinder. In order to meet the requirements of the greater volume of flow per unit of time without reaching prohibitive speed in the ports it will be found that port areas are larger than a year ago. As the manufacturers gain experience with the block casting, it is possible, without sacrificing metal, to secure wider port areas and better waterjacketing facilities for the same weight.

The effect of the cored-in manifold on carburetion should be mentioned under this general head. In the first place, the intake gases are hotter than they are with the exterior manifold, because it is quite possible to extend the waterjacket around the integral passage so that in some castings it is almost completely covered. The difference between the temperature of the water and the outside atmosphere, under ordinary conditions, is very close to 100 deg. and this naturally has a considerable effect on the density of the gases and hence on the heat value of a given volume of charge.

Trends of the American Automobile for Six Years, Showing V



Tions of Most Important Factors In Design and Manufacture



Average Spring Types Show Changes

The Cantilever Spring Now an Established Type—Few Platform Springs Remaining—Frames Are Stronger and New Design Is Used on Two Cars—Tire Size Touches Low Water Mark

'N frame design there is but one really new thing this being the Brush frame used on the Moline and the new Marmon. This frame is a scientific construction wherein 'ery portion is made to do work. For example the width of ction of the side rails is so small that they would have no easurable resistance to whipping, and stiffness is obtained using a steel running board, bent up at the ends and atched by rivets so that it provides the essential lateral stiffss. The one piece of steel is both frame stiffener, running ard and part fender, as the bent up portions form the rear d of the front and front end of the rear mudguard.

This frame is raised at the rear so high that it forms the lge for the rear seat cushion, and so cuts out a portion of body and it can be made both stronger and lighter than usual frame though it is not greatly more expensive.

With ordinary, conventional frames, there has been a idency to increase the depth, to make them stronger in t, the chief idea being to eliminate body stresses and leaks. More makers are using frames with straight sides, l there is a small increase in taper frames, that is frames which the sides are straight, or almost straight, but the k is wide and the front narrow. This construction gives ood body support and is cheaper than the bent frame.

ıtilever Springs Established

'he cantilever spring now has been accepted as a standard e, to be used where its shape is convenient to other chassis siderations. It has proved in practice at least as good as other form, and a long spring can be employed without ıng frame, which is sometimes an advantage. As many 8 per cent of the cars on the American market now have type of spring; the three-quarter elliptic remaining the t popular type with 42 per cent. Semi-elliptic, is found ınly 15 per cent of chassis while platform springs have ıped to under 6 per cent.

ndoubtedly the introduction of the cantilever has led to h spring discussion that has had the effect of improving r forms of spring, and the suspension of the 1916 chassis stinctly better than that of any previous year. Lessenweights make the spring man's task the harder. One g which has helped is the realization that good steel has ı to do with the matter, and buyers are a little less ind to be swayed by price to the detriment of quality.

heelbase has varied quite a little in the past six years, g to an average maximum of over 122 in. in 1915. This it has lessened on the more expensive cars and lengthon the low price ones, the effect being to bring about a t reduction on the average, the 1916 figure for all cars ; 119.5 in. The changes are due in the main, to the ine of low price seven-passenger cars, and to the introon of the many light sixes costing between $1,200 and 0, while the eights also have had something to do with ıatter.

'es are smaller than for many years, the popularity of 2 x 4 without doubt having had much influence on this. again, the increase in the number of light cars has allowed a drop in tire dimensions. Smaller wheels mean an opportunity to cut the length overall a little, and so have helped the wheelbase reduction perhaps to a small degree, though not to any great extent.

Hotchkiss Drive More Favored

In transmission the trend toward simplicity is very marked. Hotchkiss drive, or that form of drive in which the rear axle is clipped rigidly to the springs and the latter take all driving stress, is on the increase, torque rods are falling off, and radius rods have almost vanished. This is an effect of increasing spring knowledge, for it is easy now to make a spring that will do double duty.

The Hotchkiss drive can be employed only with an open driveshaft that has two universals, so the inclosed propeller shaft has few new adherents, but there are many who like it because it gives protection to the universals, always awkward things to grease, and so does away with a point that needs attention.

Suspension Generally Better

Undoubtedly the average automobile of 1916 is much better sprung than any of its predecessors, and this is due to the great wave of interest in spring design that occurred about a year ago. Spring making and spring designing have both become more scientific and the amount of data now available makes it easy to find the proper spring proportions to give a desired effect. Different spring engineers go to work in different ways, but this year they seem all to have been extremely successful. It only needs a ride in almost any car of three or four years old to bring home how greatly more comfortable are the springs of the new chassis.

Spring Bushings Improved

A detail of spring design which has also improved quite considerably is the eye bushing. Much greater bearing surface is the rule and on many cars the self-lubricating bushings which are a compound of brass and graphite are employed, these rendering the application of grease unnecessary. In other cases there are substantial bronze bushes with good provision for the easy supply of oil or grease, and the accessibility of these lubricators has been studied in making the body attachment.

Left Steering Prevails

Not absolutely universal, but almost so, is left steering, since but 9 per cent of manufacturers still make right hand cars while 2 per cent have an option of left or right. Left control with left steering is also very rare indeed, center control being used upon 90 per cent of present day chassis. There has been no change in the general layout of steering, and no entire novelties, except a couple of new swivel heads on the Overland little four and the Marmon six. Folding steering wheels have gained no fresh supporters, and the King which has used one all the year has dropped it on the new model just added to the line.

Many Changes in Body Design

The Bodies of the 1916 Cars Differ Largely from Those of Last Year—The Most Advanced Designs of 1915 Are To-day the Average of Good Practice—The Great Increase in Seven-Passenger Equipment Is Offset Partly by the Introduction of Three and Four-Passenger Roadsters by Many Manufacturers

At the shows a year ago it was very noticeable that the new bodies were a feature of many exhibits. Extremely handsome streamline types appeared on the stands of the leading manufacturers, and internal comfort was developed along with external good looks. During the year body engineering has advanced almost as much as chassis design, and the bodies of 1916 are improved out of all recognition by comparison with those of three or four years ago.

Streamline Is Cheaper

The body with the smooth exterior that is now considered the proper form has taken a long time to develop, the trend toward simplicity of outline being traceable for ten years or more, but it is not always appreciated that this desire for simple lines and few corners and curves, has a very good reason for its existence apart from any canons of beauty.

Speaking broadly, the fewer panels there are to a body the cheaper it is to make, the fewer junctions and corners the easier it is to paint, the simpler the outline the easier is the making of the frame. Added together these things mean that the body which is now the common form, and which we mostly regard as the proper thing for an up-to-date automobile, is considerably cheaper. Reduction in car price has been due to reduction in body price to quite an appreciable extent.

More Metal and Less Wood

Originally the automobile body was built of wood and had the panels of steel attached to fill in the gaps in the frame, so to speak. To-day the steel of the panels is frequently used for its strength, and the wood cut down accordingly. Thus we have the instance of the Dodge car wherein the body is a complete steel shell before any wooden parts appear. This particular example is worthy of special mention because it seems likely that it contains a principle which may become important. In making this body the steel panels are set in a frame which is a sort of jig, and when in position are welded together electrically, the jig being furnished with the necessary contacts and terminals. This produces a steel shell inside which the seat frames, etc., are afterwards erected, it makes a body in which the exterior surface has no joints in the ordinary sense of the word.

For a long time the Pierce-Arrow cars have had bodies of cast aluminum which are made from pieces bolted together, thus making a stout aluminum shell similar to the sheet steel shell produced by the Dodge process, the Pierce system makes excellent bodies, but is expensive, and the Dodge system seems to be the start of a cheaper and lighter construction having many of the same advantages.

Of course this is partly speculation, as the majority of bodies are still made on the old principle, but the idea is entirely in keeping with other automobile engineering developments of the past year or two.

With the ordinary body built up on a wood frame, the panels are now frequently devoid of double curves which necessitate hammering or die-pressing the sheets of steel. Many of the bodies which are regarded as particularly good in appearance are made from sheets of steel which are simply cut out and bent in one direction. Thus many bodies have one piece of steel extending from one tonneau door to the other, being simply bent round to form the back.

Still, these cases are fewer than where the back panel has a double curve, and in such instances simplicity of manufacture is obtained by the use of large presses which perform the bending operations much more cheaply than the hammering of years ago.

A petty detail that saves much work is the abandonment of beading which used to be employed to so large an extent in the decoration of bodies. The present growing habit of bending over the top edges of the panels to form the top edge of the body, making a flush joint with the upholstery, is not only neater in appearance, but considerably cheaper than the old style of finish with a bead nailed on.

Elaborately buttoned upholstery is also slowly giving way to the smooth finish, partly because this saves money in the factory but more because of the undoubted advantage in the greater ease of dusting and cleaning the cushions.

Probably the most important development of the year in body manufacture has been in the painting processes evolved. First we have new methods for applying the paint to both body and chassis, and second, new ways for drying the paint after application. In painting the air brush has cut enormous numbers of hours from the labor needed to paint the output of a factory, and in drying the progressive system of oven treatment has turned days into hours.

Great Changes in Painting

It is in painting awkward shaped pieces, such as go to make up a chassis that the air brush shows to the greatest advantage, perhaps. A block of cylinders, for example, can be painted all over, completely and better than with a brush in a matter of seconds, actually in considerably less than a minute. The paint is also laid on more evenly, and more economically, there is less waste, better work and much less labor, all combined in one process.

Then in drying the paint after application, the larger factories now mostly have installed a series of ovens like great rooms, through which the bodies and sometimes the complete cars, pass slowly, entering one end of a sort of tunnel when painted and emerging a few hours later at the other end, completely dried. This system has cut out completely all uncertainty due to weather or to time of year; it has removed a really serious trouble. In the words of one manufacturer "it enables an absolutely standard excellence of finish to be guaranteed" a thing which was previously almost impossible with a commercial process of manufacture. Let it be clearly understood, too, that the work done this way is better.

This year there are upon the market quantities of inex-

pensive seven-passenger cars, and the average cheap car has a much larger body space than ever before. Many manufacturers have gone to the most elaborate trouble to accommodate a large body; dealers have demanded it and the engineers have accommodated the dealers.

But, together with this tendency to make the five-passenger car of 1915 into a seven-passenger car for 1916, there is to be noticed a very strong demand for roadsters, for three-passenger roadsters particularly, and now many manufacturers are coming forward with roadsters to seat four. It is difficult to believe that the average man who buys an automobile really needs a seven-passenger car. It is but seldom that a seven-seated car is seen on the road with all its capacity occupied, so if it is granted that a seven-passenger body is wanted by many people there must be many others who are satisfied with something considerably smaller.

Undoubtedly one fault of automobile bodies has always been the separation of the front and rear seat passengers; it is a fundamental fault of the tonneau style of design, and it is not easy to see how else the same number of people could be accommodated, but the close coupled, small tonneau car, the four-seated roadster as it is sometimes called, and the clover leaf three-seated body are all companionable. They are cars in which the whole complement of passengers can comfortably converse together, and being so they are ideal forms for everyone except the man who expects always to be chauffeur driven and the man who wants to transport the maximum number of passengers.

Divided Front Seats Popular

The same idea is expressed in the larger body which has divided front seats, since for some indefinable reason, it seems to bring the front seats and the rear one closer together, even if it does not do so actually. This was a new type last year, but it will be seen on many stands at the 1916 shows, and in not a few instances the individual front seats are adjustable to suit the convenience of the persons who usually will occupy them.

The body with individual front seats is a little more costly to build than the conventional type, because it lacks the bracing which the front seat frame normally supplies, but this difficulty is not hard to overcome if a little more is spent upon the framework. A very rigid type of body of the divided front seat sort can be made by using only one door, this being on the right side as a rule, and this is a cheaper form than one with four doors. It is almost as convenient and distinctly stronger, being less liable to develop squeaks, because of the rigidity given by the continuous, unbroken left side, but it is so far quite uncommon and it depends upon public taste to say whether it will come into greater favor or not.

Closed Bodies in Many Types

The tendency to add closed bodies to the list of available models, which was observed last year has continued for 1916, with the result that bodies which entirely protect the driver and passengers are now obtainable on a very great number of chassis. Closed bodies are called by many names of a more or less meaningless character which have grown from French carriage nomenclature, but the principal forms are now fairly well defined and fairly well known. The great trend of the year has been the production of much cheaper sedan and coupe types so that a closed car can now be bought for very moderate expenditure.

Demountable Top Established

Hand in hand with the production of cheaper closed cars comes the vogue of the convertible body, which can be either open or closed. Commencing a year or two ago with some rather cumbrous designs, progress with this style of body has been extremely rapid. At first a detachable top proclaimed its detachability to all beholders, but to-day there are many which are hard to distinguish from the regular closed car. Hardly any of the new designs call for any feature of the open body that is different from standard, which means that the convertible car is a normal touring car when open and an almost normal closed car when the top is on.

Whether this type of body is to become widely used depends upon the public. It may be that the man who buys this design of body will find the closed setting so comfortable that he will buy a permanently closed car next time. It is a very interesting field of speculation, and development during the next twelve months will show what is to happen. Meanwhile the advent of a new and apparently remarkably attractive style of body has to be chronicled.

It is particularly striking to notice how many manufacturers have designed their 1916 open touring body so that it will conveniently convert to a closed car, in many cases the irons which support the top are screwed into sockets so that they can be removed to give place to attachments for the permanent style of roof. Door hinges are set so that the upper part will swing properly if it is afterwards desired to attach it, and the windshield is arranged so as to be suitable for forming the front of a closed body.

Altogether, what with many new seven-passenger bodies, with the demountable top or convertible car, the divided front seat, the clover leaf roadster for three or four, and the return of the close-coupled tonneau form, the buyer of an automobile to-day has such a choice of bodies as never before has been offered to him. There seem to be at the moment an almost needless number of designs, it is as if in reducing the variety of the chassis produced the manufacturers were offsetting the advantage by increasing the number of bodies.

Names of Automobile Bodies

The increasing number of styles and the constantly changing design of automobile bodies, has created some confusion in the minds of the general public, as to just what is the correct name to apply to the various body models. This confusion is partly due to the rapid changes in design, and partly to the manner in which the cars are advertised as the advertisements often feature the car by playing on the name and in some cases, manufactured names are substituted for the standard ones.

It is not intended in this article to enter into a full description of all the styles of bodies used, but simply to outline the most common types and concisely index them. Briefly it might be well to state that the names of bodies are coming to have a national meaning rather than an international one, and the meaning conveyed by a few of the names now have a different sense in Europe than in this country. The names given below each illustration, are those used by the majority of the best body builders and ranged alphabetically they are as follows:

The *brougham* is a small town car, the name is very often misapplied as the true brougham does not have a window in the quarter back of the door.

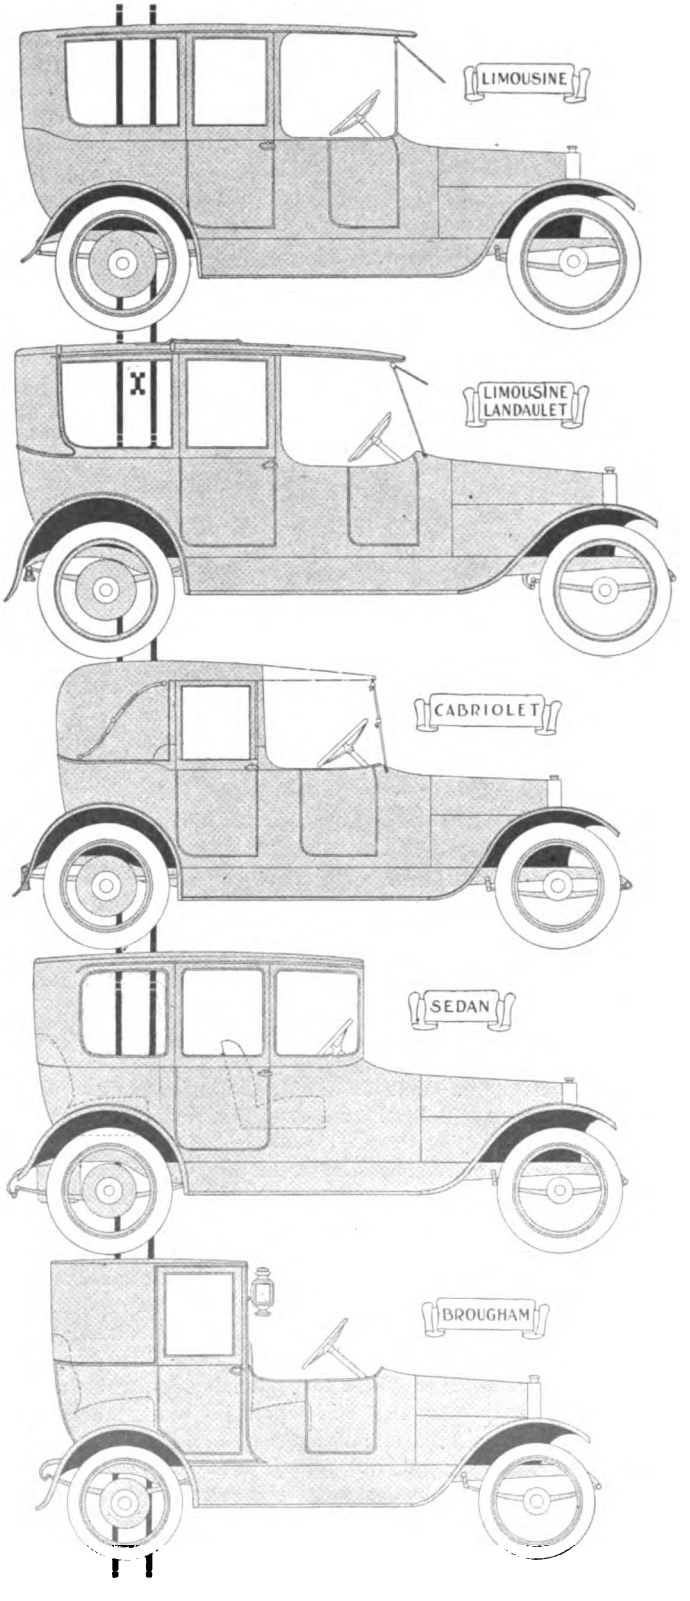
The *berline* is an inclosed body, having a separate compartment for the driver, virtually it is a limousine with the driver inclosed.

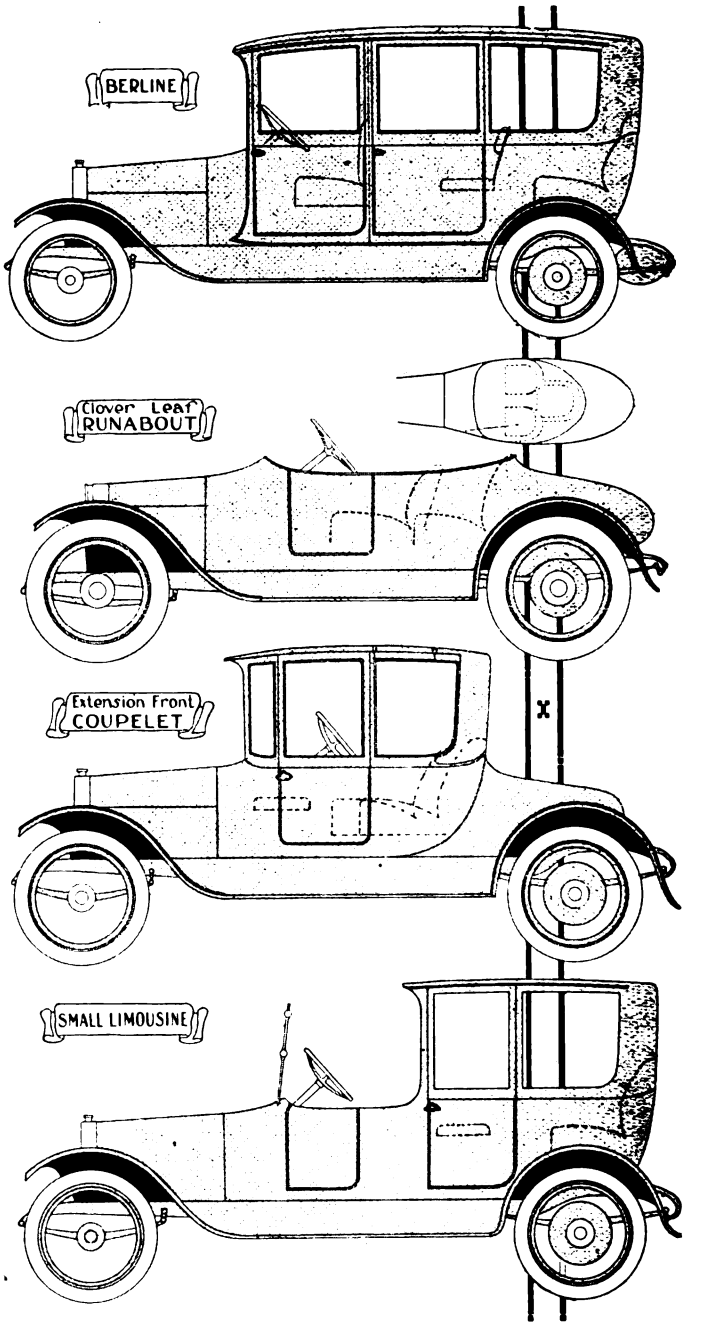
The *cabriolet* is also of the town car class and is generally understood. There is a larger type cabriolet, but it is not much used in this country.

The *coupelet* here shown is made with an extension or window forward of the driver, and the title is amplified to make it understood, in designs where the extension is not included, the name is simply "coupelet" and where the top is stationary (does not fold down), it is called a *coupé*.

The word *coupé* is used to designate a small inclosed drive body and is, in winter bodies, what the runabout is for summer use. It has a meaning slightly different from the horse-drawn vehicle of the same name, and "coupelet" is a manufac-

MODERN BODY NOMENCLATURE





tured or modern word applied to the same style of body, but having the folding top.

The *limousine* is too well known to need a description, and the small limousine is the "town car" size.

The *limousine-landaulet* is the most popular type of falling top body and comprises the essential features of the limousine with the added feature of an openable top.

The *clover leaf* runabout is the name applied to this body on account of the seat arrangement being in the form of a three-leaf clover, the two views of this design conveying the meaning.

The *sedan* is the most general word used to designate the inclosed drive body having the doors one each side and about the middle of the body. Various names are applied to this type, as single compartment, inside drive, inclosed drive, etc., but the name sedan will be the one most generally accepted, as it is a single word and conveys the meaning to the majority of the buyers definitely.

The conventional touring body is so well known that it is not deemed necessary to illustrate it, and the same applies to the runabout.

The Automobiles of 1916

With Fewer Makes of Car and Fewer Designs of Chassis, the Choice Is Wider Than Ever Before By Reason of the Many New Types Now Offered

Section I—Cars Made Only with Four Cylinders

IN describing the automobiles of 1916 it is noticeable that specialization is greatly on the increase in manufacturing. Many makers produce nothing but four-cylinder cars; an almost equal number manufacture six-cylinder cars exclusively. Next in order, but a smaller list than either of the first two, come the makers of more than one type, a four and a six, a six and an eight, and so on. Last we have the nine firms who have concentrated upon the V-motor, seven of them on eights and two of them on twelves.

Thus the short descriptions of the cars listed as 1916 models by the manufacturers group themselves well into this classification. In the following pages cars made exclusively with four cylinders form Section 1. Section 2 is composed of cars which are only to be had with six cylinders. Section 3 is the V-motor division of eights and twelves, and Section 4 the cars made with various sorts of motor. In this last section, of course, will be found fours, sixes, eights and twelves.

That there should be nine manufacturers devoting all their energies to V-motors is a remarkable fact, when it is remembered that a year ago there was but one such. It is perhaps equally remarkable that there should be so many makers who scheme to produce nothing but sixes, and of these many are sixes of most moderate price.

In the field of the fours there remain a few of high price, and there are still a fair number commanding moderate prices, a little above those demanded for the least expensive sixes. In this field, too, we of course, find all the very cheapest cars.

In the six field are the cars of highest price, since no V-motor chassis has yet been offered for more than $3,000 in standard form, and there are several sixes costing much more than this.

In the unspecialized class, it is noteworthy that the majority of the chassis are assembled.

Allen Has Enlarged Motor

Only one Allen chassis is now being made as compared with five last year. The motor has ⅛ in. more bore being now 3¾ by 5 in. and is made in the Allen plant, being of a highly modern design and conspicuous for compactness. It is a particularly short four-cylinder engine considering the size of the bore.

Simplicity is served by the use of thermo-syphon cooling and lubrication is a combination of splash and pressure.

The rear axle is a floating pattern made specially to Allen design; it has straight bevels and a pressed steel housing. Another feature is the use of long, semi-elliptic rear springs underslung and very flat, the end of the frame being brought down in a sweeping curve. The propeller shaft is inclosed in a torsion tube, but the drive is through the springs, Hotchkiss fashion.

The brake operating rods are conspicuously straight and have few links or connections, in fact the whole rear part of the chassis is devoid of any joints needing attention. Features of the body are the wide doors

with concealed hinges and high sides with flush upholstery; both a five-passenger and a roadster are supplied on the same chassis.

Arbenz Is New Model

A new, and very inexpensive, model Arbenz is being made with five-passenger touring body only. It has a conventional design generally, with Aplco two-unit starting and lighting equipment, and Connecticut ignition. A floating type rear axle used has double internal brakes of large size and the equipment is inclusive of 30 by 3½ in. tires. The specifications are those of a thoroughly well proportioned, light car.

Argo Considerably Improved

It is evident from an examination of the Argo cars that they were designed to give reliability along with simplicity and lightness of construction, these things making possible their low prices.

Both roadster and five-passenger body types are built upon the one wheelbase of 96 in., and in the general scheme of the layout the engine and clutch form the front unit, the gearset and universal another, and the rear axle with its inclosed drive shaft a third. The engine is a conventional four with dimensions of 2¾ by 4½ in., developing 17.5 brake hp. and having a rating of 12.1 Cylinders are block-cast, and bolt to the aluminum barrel crankcase which carries the two-bearing crankshaft.

Again, simplicity is fostered by making the clutch a reversed cone, bolting the female portion to the outer part of the flywheel and then forcing the cone inward to release. This also greatly simplifies the clutch throwout mechanism. Just back of the gearbox, there is still further evidence of simplification, for the universal joint also is a transmission brake. The outer part of the joint takes the form of a drum, and a band contracts around it when the lever is applied.

Instead of the regular form of gear differential, the Bailey gearless type is employed in the rear axle. To simplify the control, the service brakes are applied by the same pedal that releases the clutch, they coming into action after the clutch. In either touring car or roadster, the front seat is adjustable for height and leg room.

Bell Has Full Equipment

This chassis, with wheelbase of 112 in. carries either a roadster or five-passenger touring body and is a soundly designed inexpensive car without any very remarkable novelties. For an inexpensive machine it has a very complete equipment including such useful accessories as a gasoline gage, while the 31 by 4 in. tires are non-skid on the rear wheels.

Spiral bevel drive in a Hess floating type axle is used and the unit powerplant has a Disco single-unit lighting and starting outfit operating at 12 volts.

Biddle Is Large Four

A newcomer among automobiles, the Biddle, has a motor 3¾ by 5⅛ in., and so should have plenty of power. The motor follows usual lines and is fitted with Westinghouse electrical equipment. A point about it which is uncommon is that the chassis only is obtainable, for special body equipment, or there is a choice of three standard bodies of five-, four- or two-passenger capacity.

Another unusual detail is the provision of four speeds in the gearset, which is in unit with the engine this giving a high gear ratio of 3.2 to 1. The direct gear is the third speed which is 4 to 1. Both straight and spiral bevel drives are supplied.

Brewster Lists Only Chassis

The Brewster car which has been expected for some time and only recently announced, is a Knight-engined four of high grade design and workmanship which is to be sold for custom-built body equipment. The motor is 4 by 5½ in. and has the U. S. L. flywheel starter. Forced lubrication is used and a special model Zenith carbureter fitted.

The gearset is located amidships and gives three speeds, while the rear axle is a special design with spiral bevel drive, the propeller shaft being inclosed in a torsion tube which also takes the driving effort.

New Case Has Long Stroke

With 3⅝ by 6 in. bore and stroke the Case four has plenty of power. In the motor a silent chain drive is used for the front end, but otherwise the design is conventional, including splash-pressure lubrication with a piston pump to force oil to the main crankshaft bearings. Large valves and a special carbureter are claimed to give the motor every opportunity to make use of its capacity to best advantage and it is a fairly high speed engine for so long a stroke, developing maximum power at 2100 r.p.m.

The three-speed gearset is in unit with the motor and the clutch a reversed cone that sinks into the flywheel to disengage. The rear axle is equipped with spiral bevel drive and the wheelbase is 120 in., the tires being 34 by 4 in. Two body styles are offered, a seven-passenger touring car and a roadster, the price being the same for either.

Chevrolet Baby Grand Unchanged

The past year has been one of huge production in the Chevrolet plants, the Baby Grand having proved one of the most successful small fours of the year. The small, high speed motor with its overhead valves has proved a favorite. This engine is extremely neat in appearance, the rockers being inclosed by an aluminum cover, and valves are all laid bare by detaching the cylinder head. There are no valve cages, which fact assists the proper cooling of the valves.

Lubrication is on the controlled-splash system, oil being pumped from the crankcase to a sight feed on the cowl board, whence it passes to the main distributing pipe which feeds the troughs into which the connecting-rods dip. There are pockets over each main bearing and thence wicks carry a supply to each of the three camshaft bearings.

The Autolite electrical system usually supplied is not stock equipment as it bears a small extra charge. It is a two unit system, with Bendix gear for the starting motor. Ignition is by magneto, if the starting system is not taken.

Another instance of the individuality of Chevrolet design is found in the midships location of the gearset, Chevrolet being practically the only inexpensive car to use this design. It is a neatly designed transmission with ball bearings. The driveshaft is of the open type fitted with two universals; drive is transmitted through the springs and torque taken by a special stay. A semi-floating rear axle is used with straight bevels and Hyatt roller bearings. It is provided with a 4 to 1 gear ratio and the brake equipment is conventional. A distinct feature of Chevrolet cars is their smart appearance, the five-passenger body being of neat outline without going to extremes of fashion.

It is noteworthy that the Chevrolet line has been altered somewhat, as the six-cylinder car is not being continued for 1916. There are now only the four with either the five-passenger body (The Baby Grand) or a roadster which has the name of "Royal Mail," and the "Four-Ninety" which is a cheaper modification with slightly smaller motor, unit powerplant and some other small chassis differences, the main lines, however, being identical for all models.

New Crow Elk-Hart

This new model is the largest which will be produced this year and follows the same lines as previous Crow cars. The motor has a detachable cylinder head and is intended for high speed work; it is possible to remove any connecting-rod and piston without disturbing a main bearing. The body is a new design with built-in windshield. The new car is much the same in general specification as the previous model which

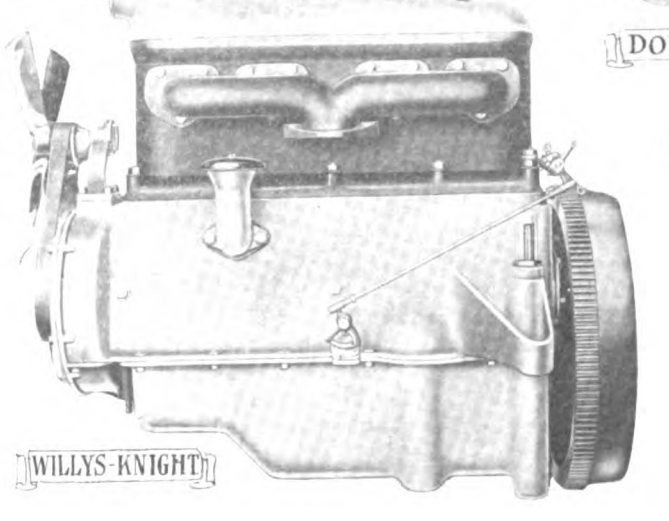
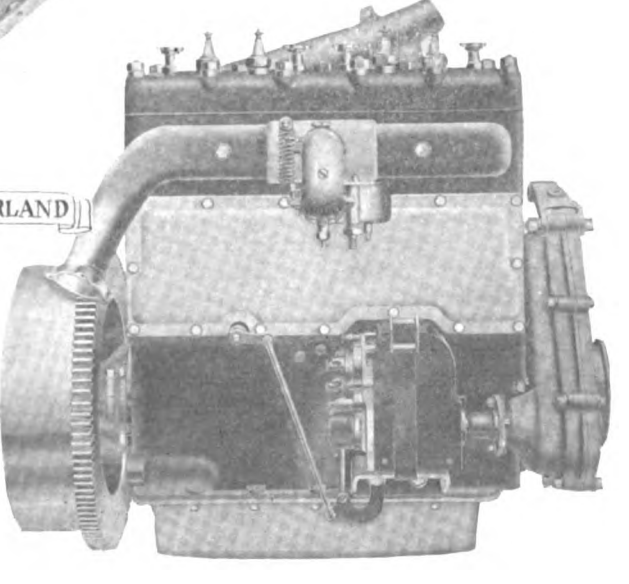
DORT



WILLYS-KNIGHT

OVERLAND



it replaces, but a very substantial reduction in the price has taken place.

Detroiter Has Good Equipment

The 1916 Detroiter while not departing from the conventional in design to any great extent is well cared for in detail. For instance, the tires are 33 by 4 in., front and rear, and ignition is performed by high tension Dixie magneto. This is one of the cars using the Dyneto single-unit lighting and starting dynamo. It is a substantially built car with ability to carry a roomy body, and has platform rear suspension.

Dispatch Has Unique Transmission

The Dispatch chassis consists of a motor, which is a conventional four of excellent quality with pressure lubrication, and a part that the makers describe as a "control unit." This takes the place of clutch, gearing and differential and provides four speeds with direct drive on all four. Power is transmitted by friction, but the construction is unusual, containing many details of great ingenuity.

Dodge Makes No Changes

Carefully designed before it was introduced, and made by manufacturers of experience, the Dodge occupies an almost unique position by having had no alterations since its first appearance. The only real novelty is a neat detachable upperstructure, which renders the open car convertible into a closed carriage, and these are being turned out rapidly at present.

As a peculiarity the most striking feature of the whole chassis is a device which renders the countershaft in the gearset quite stationary when the high gear is engaged, the the "constant mesh" pinions if they may be so called in this instance, unmeshing as high gear is engaged. This device has been tried several times but the Dodge is the first instance of successful manufacture.

The unit powerplant with its cone clutch entirely inclosed is part iron and part aluminum while the cylinder head is removable, the valves being arranged in conventional L head manner.

The body is remarkable as an engineering product, for it is all-steel being made in a wonderful electric welding apparatus. All the body plates are held in a gigantic jig furnished with the necessary electrical connections and the passage of the current then spot welds the panels along every junction line. The result is a body in which strength and lightness are combined.

On the rear axle the brake rods and the equalizing links are laid out in a very neat way, there being only two long pull rods needed, these running forward along a line just above the torsion tube which incloses the drive shaft.

Electrical equipment consists of the North East single-unit machine which operates at 12 volts and is driven by silent chain from the camshaft. Every part of the car, barring a few accessories, is made in the parent factory which is one of the largest in Detroit and ranks among the biggest in the world.

Dort Has Original Motor

Although both roadster and touring types follow the same general idea of design, the latter is a longer chassis and the motor larger. It has a wheelbase of 105 in., and the motor is claimed to have 28 hp. as a maximum with 3¼ by 5 in. dimensions. The roadster is built on a wheelbase of 92 in. and possesses a 3 by 4 in. engine. It has very evidently been the aim of the designer of the Dort engine to give it moderately high speed possibilities very smoothly, for with an exceedingly heavy crankshaft in a motor of its size, large valves with a good lift and double exhaust manifold, everything seems to have been done to prevent vibrational troubles. Special attention has been given to the matter of equal water jacket spacing around all the cylinders, this making for uniform cooling. The double exhaust manifold feature is unusual in four-cylinder construction. The manifold is internally divided into two passages, two cylinders discharging into each passage, this preventing any overlapping.

To make maintenance of the cars as simple as possible, the Dort designers have seen to it that the oil holes are in convenient places. For instance, in the side of the gearbox there is placed a small elbow which aids in the filling of the gearset with oil. Axle bearings are made easy of adjustment by external openings and pins passing through the housing to the bearing carriers.

Cantilever rear springs are featured on the Dort. The clutch is a light cone, with six spring plungers pressing the under side of the leather facing. These springs are inclosed in little pressed steel cups that prevent dirt from getting to them.

Elcar Is Improved

This car is a model of Elkhart under which latter name previous models were known and is one of the very few machines of which the price has been raised a little, this being due to several improved features.

It is a conventional type of four-cylinder chassis with five passenger or roadster body and a high speed motor with what has been called an F head cylinder; that is the intake valves are in the head with the exhaust valves in the customary position. There is a unit powerplant with cone clutch and a special type of rear axle having double internal brakes.

Farmack Has Overhead Valves

This is an entirely new car made by a new company and has a distinctive engine with not only overhead valves, but an overhead camshaft also. Three chains are used at the front end, one a triangular drive including the crankshaft, an adjustable pinion and an intermediate, the second from the intermediate to the camshaft, and a third for connecting crankshaft and generator direct. All the valves seat directly in the detachable head and are fully inclosed. Oiling is by controlled splash with a separate feed to the camshaft.

The rest of the chassis follows conventional practice and the car is sold at present with only a five-seated touring body.

F. R. P. Has Valve-in-Head Motor

A new F. R. P. car is now ready with an overhead valve engine with four cylinders. It will be made in small quantities in three models, the motor bore and the wheelbase being the chief variations. The chassis only will be sold and at a high price, the car containing a quantity of very costly steel and much fine workmanship.

It is a chassis intended to have a capacity for high speed, the motor being very highly efficient, and weight has been studied closely. In many respects the design savors of the European school, having amidships location for the gearbox and a transmission service brake while there are four speeds with a high gear of 3 to 1.

Ford Still Model T

At this time there is no inkling that Ford intends to make any alteration in the model T as it is known the world over. The performance of the car and the low prices for both the touring and roadster models still prove sufficient attraction to the buyer. New prices have been put on the three closed body types that Ford turns out, the coupelet, the town car and the sedan.

It is scarcely necessary to go into any lengthy description of the Ford because its general design is well enough known to make that unnecessary. Since the rounding of the cowl to replace the straight dash and the enlarging of the magneto so that it would care for the electric headlights as well as the ignition, there have been no mechanical or body changes.

Briefly, the Ford chassis has a wheelbase of 100 in., and is fitted with 30 by 3 front and 30 by 3½ rear tires. The characteristic front and rear transverse springs, planetary

gearset in unit with the 3¾ by 4 in. L-head motor and simple drive through inclosed shaft are examples of the unity of purpose that has amassed the great fortunes of Henry Ford and the others in the company. Few, if any, other car makers of the world have so designed their chassis in the first place that change was unnecessary for so long a period of years.

Very attractive body work has been put on the sedan and coupélet models. Cloth upholstery is used in the sedan, which has individual front seats, the right one folding to allow entrance to the rear seat. There is a single wide door on either side, and the finish is excellent.

Harvard Is Smart Roadster

The Harvard program consists of a soundly constructed chassis free from peculiarities with a good appearing roadster body and an equipment that makes for the permanent comfort and convenience of the user. The seat is supplied with deep upholstery and the Pantasote top fits snugly on the windshield when erected.

On the same chasis a coupé body is also fitted and sells for a very moderate price. The car is geared rather higher than the average and should be capable of a fair speed on the road.

Hupmobile Is Larger

By enlarging the powerplant from a bore of 3⅜ in. to 3¾ in., the 1916 Hupmobile has been given 46 cu. in. more piston displacement, and with the stroke still 5½ in., the engine is now possessed of 243 cu. in., this, together with the large valves and direct gas passages giving the car an engine that is able to handle it in excellent shape with good accelerative ability.

The Bijur lighting and starting equipment replaces that used last year, and this change, in conjunction with the motor increase, are practically the only alterations in the mechanism, although the body design is different from the previous car in some respects, and the price has been brought down.

A short and a long chassis are offered, the former having a wheelbase of 119 in. and taking the five-passenger touring and roadster bodies, whereas the 134-in. chassis is called upon to carry the eight-passenger body. This is a body in which the folding auxiliary seat has been so constructed that it is wide enough to seat three if necessary. Practically the only difference in the two chassis other than strengthening the long frame wherever necessary, is in the spring length. Still adhering to the long underslung semi-elliptics in the rear, they are 60 in. overall on the larger chassis and 52 in. on the shorter.

One feature for comfort in the Hupp cars is in the low placing of the seats with the backs of the seats lower than the fronts so as to give a comfortable position to the occupants. A point in the body work that is appreciated, is the overlapping of the upper windshield glass over the lower for about an inch, this preventing water or cold air from getting into the front compartment.

The Hupmobile motor is of the block-cast type with silent chain drive for the camshaft and fan. Ignition is by Atwater-Kent system, and oiling by the characteristic Hupp method whereby the flywheel is used to pump it.

Interstate Has Axle Gearset

The use of a rear axle gearset is becoming less common, but having used this type successfully, by reason of proper proportionate design, the Interstate company is continuing its use. The motor of this car is a long stroke engine with large, overhead valves; it is made by the Beaver company and has conspicuously good pulling power on high gear. The price has been reduced for 1916 without affecting the equipment or any other quality. There is a Remy lighting and starting equipment which also cares for ignition and a Schebler carbureter, bolting direct to the cylinders, since all manifolding is internal. A decided feature of the Interstate four is the great accessibility of the motor and all connected with it.

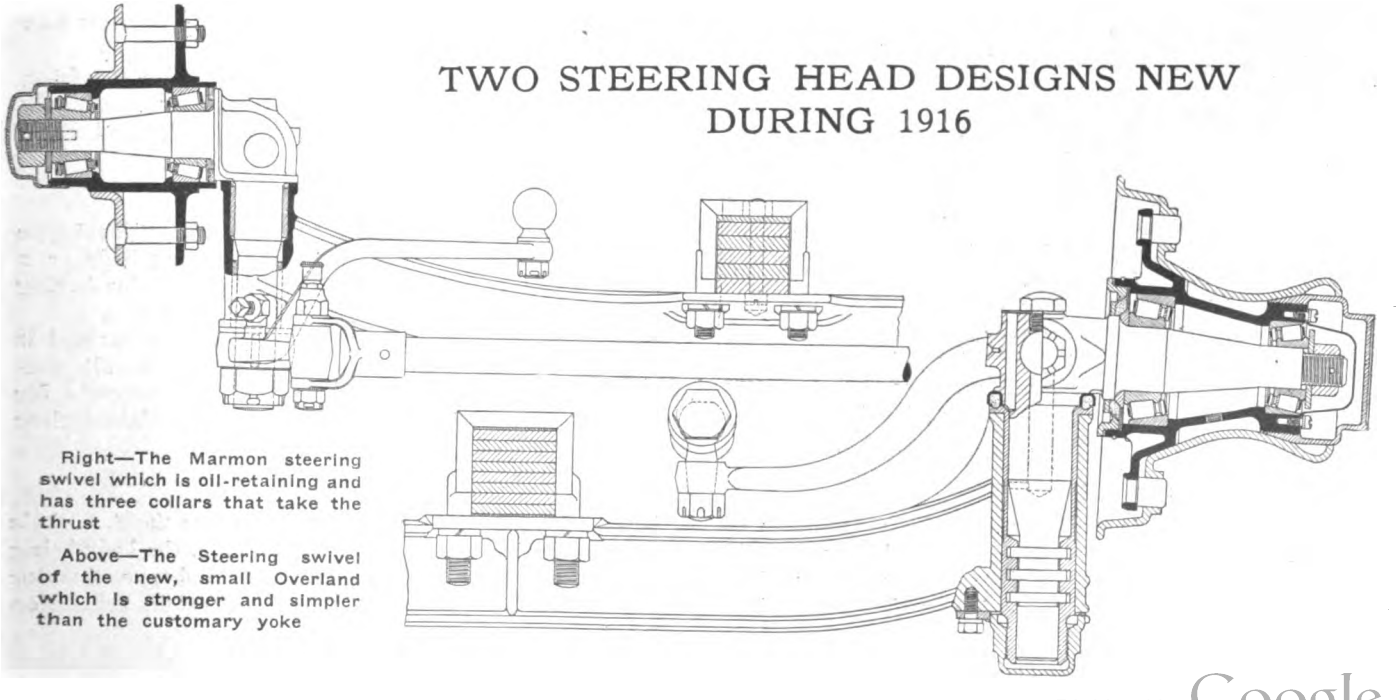
The bodies offered include a five-passenger touring and a roadster model the former holding its rated capacity without any crowding. It is nicely proportioned being a very handleable length over-all. Quiet running and good acceleration are other characteristics.

Maxwell Improved in Detail

The main idea of the Maxwell designers was to produce a car of better appearance for 1916, at the same time including in its make-up many of the things that had heretofore not been given for the price. For instance, electric starting and lighting are now standard for the touring car, and the roadster also has both at lowered prices. Due to the narrowing and raising of the radiator and the sloping of the bonnet smoothly to the cowl, the car has a larger outward appearance, though still built upon the chassis of 103 in. wheelbase.

The Maxwell engineering staff also had an eye for the matter of repairing, for they have kept the wiring to the chassis wherever possible, bringing to one central terminal block all that have to go on the body. To remove the body,

TWO STEERING HEAD DESIGNS NEW DURING 1916



Right—The Marmon steering swivel which is oil-retaining and has three collars that take the thrust

Above—The Steering swivel of the new, small Overland which is stronger and simpler than the customary yoke

it is only necessary to disconnect the terminal plug, when body and chassis wiring are separated.

In striving for better operation, the clutch has been inclosed so as to permit it to run in oil. Though a cone, it is faced with an asbestos fabric that is not harmed by the lubricant, and this gives it a very soft action. Better engine lubrication is also accomplished by distributing the oil to each of the connecting-rod splash troughs instead of the old way of introducing the oil at the front end and letting it work its way back to the other troughs. This gives more uniform oiling. To make it easy to put in the oil, the breather has been conveniently placed on the left side of the motor.

Other evidences of the improvement of the car are the use of linoleum-covered running boards instead of the former corrugated metal type; the fitting of demountable rims for the 30 by 3½ in. tires and the enlargement of the body. Three inches is added to the seat width and there is more leg room.

The Maxwell 3⅝ by 4½-in. motor is of the type in which cylinders and upper part of crankcase are integral, with the head detachable. Thermo-syphon cooling is efficiently used, and starting and lighting are by the Simms-Huff system. A motor-generator is carried on the motor's left, with the generator drive by a belt under constant spring tension, and starter drive through the flywheel. Twenty-five horsepower is credited to the engine, which drives a three-quarter floating axle, with a ratio of 3.6 to 1. The car has three-quarter rear springs and three speeds.

Mecca Has Gearless Differential

A new car this year the Mecca follows the lines of standard practice in most respects but it uses the "Gearless" differential and has a type of single plate disk clutch that is rather interesting. This has toggle lever operation and is intended to run in oil. On the rear axle are double internal brakes instead of the usual pattern.

Mercer on European Lines

In general the design of the Mercer chassis which made its first appearance at the 1915 shows has not been changed. As a high priced, originally designed four of large dimensions and the best of workmanship it stands in a class which is now very small. Perhaps the leading feature of the car as a whole is the bodywork, which is the smoothest possible streamline, combining the best of both French and German practice, even the six-passenger touring car gives a proper impression of the car's extreme speed ability as the top and windshield are made to suit the body lines.

In the chassis the U. S. L. flywheel dynamo and starting motor is found, this being entirely inclosed, and the gearset is amidships, connected to the dry disk clutch through a short universal shaft.

The motor follows the principles of racing engine construction, save that it has L-head cylinders. It is capable of high speed and gives a high mean effective pressure at low speeds, so that the car has plenty of ability even on the somewhat high, direct fourth gear. On the back of the gearbox there is a large internal brake this being the service brake, and very powerful indeed. Hotchkiss drive is used, with the semi-elliptic springs very long and flat.

There are four body styles; touring cars with six- and four-passenger capacity and two roadsters of two passenger size, one of the latter being classed as a raceabout, specially geared, without self-starter and capable of extremely high speeds.

Metz Continues Friction Drive

Consistently the Metz company have been upholders of friction transmission for their small car and they are still adhering to it after several years' experience during which very many cars have been put into the hands of the public. There is nothing simpler than friction drive and whether it gives good or bad service depends mainly upon the care with which the design is performed. Friction drive has many little points which only experience can teach and the Metz engineers seem to have thoroughly mastered the special problems in this connection.

The motor has been increased in size to 3⅞ by 4 in. and a five-passenger touring car is now supplied as well as the roadster. Also the original acetylene lamp equipment has been replaced by a Gray & Davis complete outfit for lighting and starting, which is stock equipment. Ignition is still by high tension magneto, however.

From the frictional transmission, with its seven forward speeds, the drive passes to the rear axle through a single chain. The tires, being 32 by 3½ in. are large for the size and weight of the car. Either wire or wood wheels are supplied according to the choice of the customer.

Moline Knight Enlarges Motor

The Moline Knight motor was always one of the neatest designs, and deserves the credit for having aluminum alloy pistons nearly two years before they became common. The larger four which is made by the Moline company has not been altered this season, but the small four has an extra ¼-in. of bore being now 3¾ by 5 in.

Apart from the Knight motor the Moline chassis is very interesting as it uses the Brush special frame construction and rear spring suspension. The frame is so made that the running boards, which are steel, form a vital part of the side members, their strength being used fully. The rear end of the frame is raised in such a way as to eliminate a large part of the body, the rear seat setting directly on the side rails. At the rear, the springs are transverse and there are two of them back to back and one above the other. They are of slightly different length and so of different period. The upper has a shackle attachment to the frame at one end and a pin at the other, and the lower has corresponding attachment to the axle. The effect of these two springs is to provide a very easy suspension and yet roll is eliminated by the difference in period. One spring damps out the other so to speak, when a severe shock is encountered.

Touring and roadster bodies are fitted to the smaller chassis and a wide range of all types for the larger.

Monroe Adds Electrical Equipment

A small car selling for a very low price the 1915 Monroe did not have a lighting and starting outfit, but this has been added for 1916 without alteration in price. It is a true light car with a neat little unit powerplant and a floating rear axle. The generator and starting motor are of Auto-Lite make and the carbureter a Zenith.

There are two sorts of body, a roadster and a speedster, both listing for the same price. The roadster is a nicely designed streamline form with top, side curtains and windshield complete.

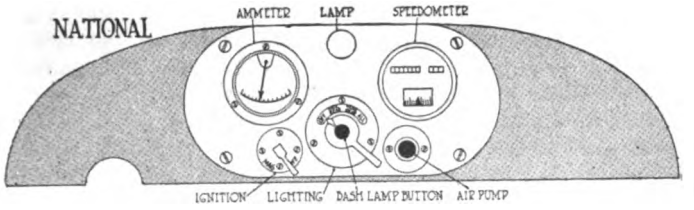
Morse Is Large Car

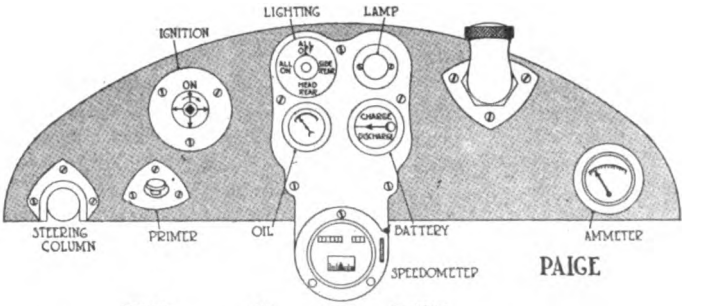
A big four-cylinder car, the Morse has a conventional type of chassis for five- or seven-passenger touring body or a roadster. It is one of the few cars with an engine having singly cast cylinders and amidships gearbox location.

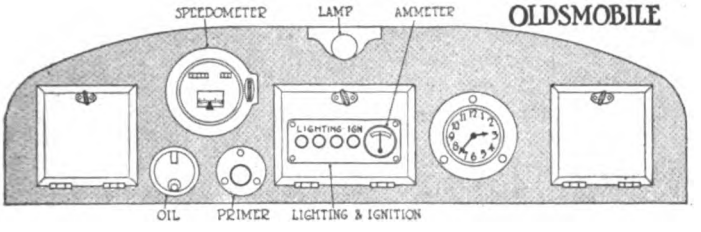
Having a 129 in. wheelbase it is quite a large car and is of substantial construction. Gray & Davis two-unit electrical equipment is employed with Eisemann magneto for igintion. The accessory equipment is of the highest class and most extensive.

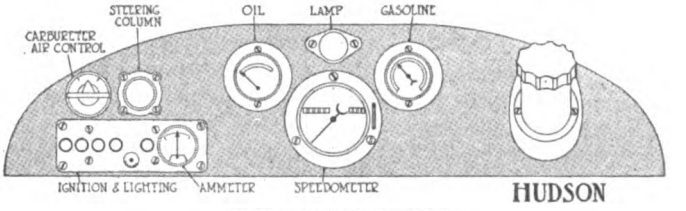
S. J. R. Is New Roadster

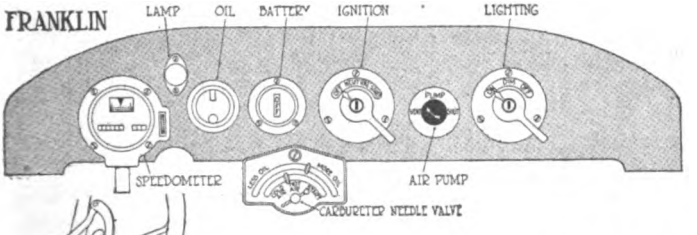
An addition to the list of four-cylinder cars the S. J. R. is made in three-passenger roadster form only, the body being steel, with a special dull finish. A high-speed type of motor is used and a high power output is claimed in proportion

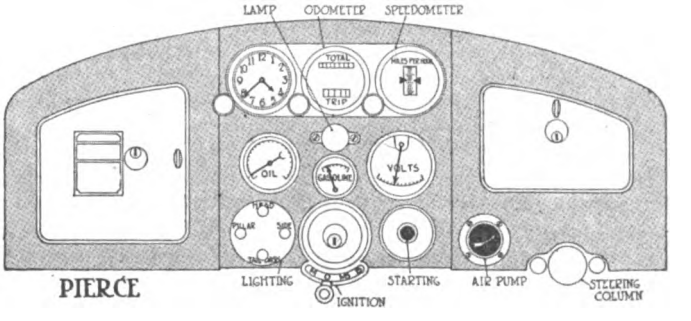


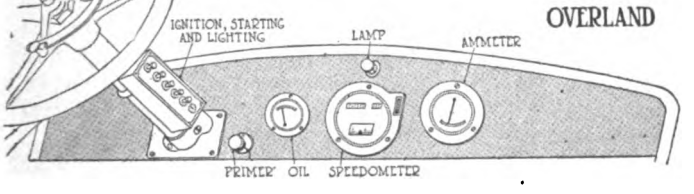


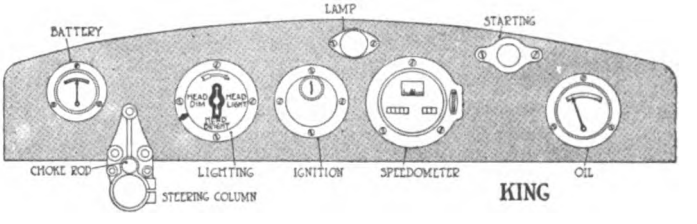


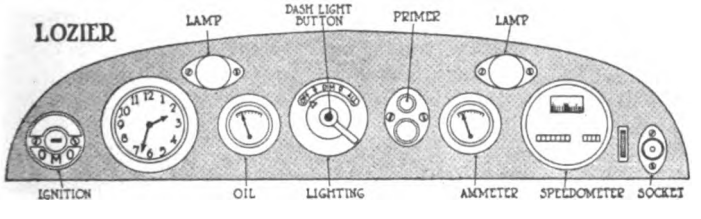


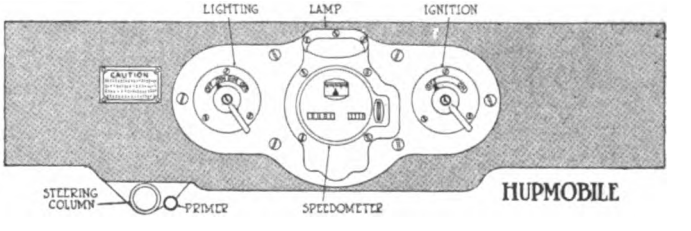


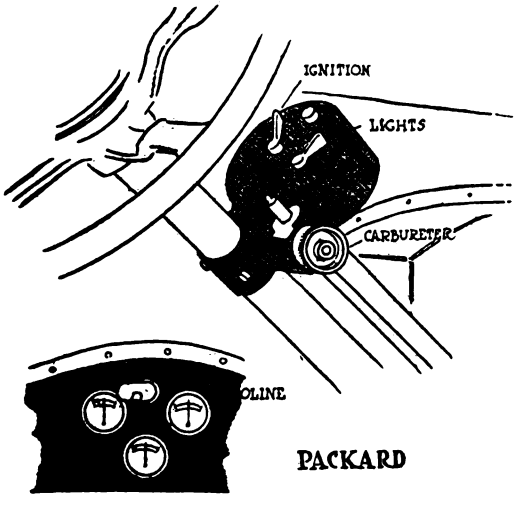












SOME TYPICAL COWL BOARDS

There is still great variation in the arrangement of accessories on the cowl board, different manufacturers having different ideas concerning which disposition is most convenient for the driver. Broadly, there seem to be two layouts; the grouped form wherein all fittings are concentrated at the center, and the spread form where everything is arranged in a line right across the board. It seems there should be some opportunity for standardizing work in this connection.

It is a little surprising that the undoubted convenience of steering post control units for switches and carbureter adjustment has not caused a greater number of manufacturers to adopt this style of design, and there would seem to be an opportunity for some of the electrical firms who make cowl board fittings to add a steering post unit as an alternative. The tendency to concentrate fuses in a readily accessible compartment or plate on the cowl board is noteworthy, and greatly to be commended, since it facilitates the tracing of a fault.

to the displacement. Ignition is by high-tension magneto, and lubrication maintained by a plunger pump, while a special design of carbureter is employed.

Special attention is given to comfort, the rear springs being chrome-vanadium steel cantilevers 48 in. long, and the upholstery leather. An original shape of radiator and domed fenders add to the appearance.

Spaulding Has Special Body

A thoroughly well made four-cylinder chassis with plenty of power and high class components the Spaulding has been improved only in minor detail. A special feature of this car is the supply of a touring body for five passengers which can be converted into a sleeping place by dropping the back of the front seat. This is done in a few moments and the cushions are so shaped that a comfortable bed can be fixed up.

Magneto ignition and the Entz system of single unit lighting and starting are fitted to the Buda motor, and the three-speed gearset is situated amidships, while the floating rear axle has exceptionally large brakes.

Sterling Is Newcomer

This is one of the most recently announced new cars and will be made in roadster form to sell at a very moderate price. The motor is a Sterling 2⅞ by 4 in. with overhead valves and splash-pressure lubrication. There is a cone clutch and three-speed gearset in unit with the motor, and the axle is a floating type supported on cantilever springs. Two bodies, a five-passenger and a roadster, are provided.

Stutz Sticks to Fours

Improvement in body design is the most striking change in the Stutz cars for 1916. The new bodies are fitted to a single chassis which is made in two lengths, 120 in. and 130 in. wheelbase. Probably by far the most attractive car the Stutz company have ever produced is the "Bulldog Special," which is a very low built touring car with seating accommodation for four. There is also a touring body for six passengers on similar lines. This body has no rear doors, passengers reaching the tonneau through the aisle between the front seats, and this, added to the elimination of side lamps, makes the outline of the car extraordinarily smooth.

In the "Bulldog Special" there is a tonneau cowl this being divided into two compartments one fitted to take a lunch kit and the other for two Thermos bottles.

The motor is still the well tried and proved T-head type four, but it has been improved by the addition of a good deal of space to the crankcase so that the latter now holds 2½ gal. of oil and replenishment is only needed at long intervals.

The operation of the accelerator pedal has been rendered easier by adding a heel cavity in the foot board, and a hint of racing experience is seen in the adoption of racing type Hartford shock absorbers as standard equipment. Another racing feature now standard on Stutz cars is the Moto-Meter which will in future decorate every Stutz radiator cap. The Stutz company offers a wide choice of coloring, paintwork in a series of greys, reds and yellows being available. There are three colors of upholstery to choose from, red, green and black.

Vixen Has Friction Drive

A small car with narrow tread, the friction driven Vixen has been little altered this year. The drive incorporates a friction set at the rear end of the chassis with a friction driving disk for each rear wheel, the connection between either disk and its respective road wheel being by side chain. The motor is a small four-cylinder and the body has the two seats arranged tandem fashion.

White Program Two Fours

A large and a smaller four are being made by the White company, there being very little difference between the present series and that of 1915. Sane design with the very best procurable materials and workmanship are the chief White features, in fact the White gasoline car has changed mainly in body equipment since its first introduction.

Both chassis have block motors with passages cored in the casting and combined pressure and splash lubrication fed by a plunger pump. A special lighting and starting apparatus is used and single, Bosch magneto ignition. On both the large and small chassis the gearset is located amidships and has four speeds, but the smaller car has the direct drive on third while the larger has a direct high gear. A remarkably easy action single disk clutch is used.

The White electric equipment stands almost alone by operating at 21 volts, this same potential being used for all the lamps.

Body styles have been brought up-to-date and a very handsome series are now being supplied, they include almost every conceivable type, touring, town car, roadster, landaulette and limousine. Long, three-quarter elliptic rear springs are used and these are relieved from all stresses save those arising from the weight of the car as both radius and torque stays are fitted.

Willys-Knight Entirely New

To the Willys-Knight belongs the distinction of being the first car equipped with the Knight engine to be built in quantity. In fact, the car brought out last July under that name is not like the previous Willys-Knights at all, and though the motor follows the latest ideas in Knight construction, the car sells for very much less.

In its new form, the car adheres strictly to standard Overland construction in the chassis, and in the general outward appearance, and due to the standardization that this makes possible, the price at once is explained. The axle design, the incorporation of the gearset as a part of the rear unit, and the layout of the springs and frame members are well known in the design of Overlands. There are two open and two closed bodies, all fitted to the one wheelbase of 114 in.

The Willys-Knight engine as now built is a four-cylinder block construction with a cover plate going over the top of the individual cylinder heads proper. The cover plate forms the top of the water space, and it incorporates a water outlet to the radiators, the cooling being by thermo-syphon. This construction allows the water to circulate entirely over the heads, and is an advantage over the former method of casting the Knight cylinders separately with no intercommunication for the water.

A two-part aluminum crankcase is used, and it has the unique feature of including a water passage from the radiator inlet pipe, carrying the water across from the right side to the left where it is introduced into the cylinder block by a connection at the bottom center of the cylinder casting. This is conducive to equal water distribution from a central point. There is nothing unusual in the working out of the details of the two sliding sleeves, and their actuation in the regular way by connecting rods operated by an eccentric shaft.

As in other Knight types, the oil supply regulation is interconnected with the throttle so that the amount supplied is in relation to the throttle opening. Simplicity has been aimed at in the system of lubrication by forcing oil to the main bearings, eccentric shaft bearings and driving chains at the front. The crank webs are drilled to send it to the rod bearings, from which it is thrown to the other surfaces.

Woods Mobilette Refined

A small, light car with low built two-passenger body, the Woods has been neatened here and there and made even better value for the money. It has a 36 in. tread and 104 in. wheelbase, thus being well proportioned, and the passengers are accommodated side by side by means of staggering the seats a little.

Section 2—Cars Made Only with Six Cylinders

The Number of Makes in This Section Is Considerably Larger Than a Year Ago

Buick Makes Two Sixes.

BUICKS are all sixes this year, the announcement being somewhat of a surprise in view of the poularity which the four-cylinder Buicks of previous years had attained. The new models have been produced with the main idea of standardizing parts wherever possible, while improving the design and efficiency, this, together with the greater output being responsible for a reduction in the price of the larger car and the appearance of the new small size at a price under $1,000.

Similarity of design is found in the two chassis, except in the motors. The little six uses a 3¼ by 4½-in. engine with the cylinders cast in a block, while the larger six has a 3¾ by 5-in. motor with the cylinders in pairs. Otherwise the design of both is very much the same, the characteristic Buick overhead valve construction being adhered to. The valves are each carried in individual cages, making it a comparatively simple matter to take out one or all when occasion demands, and the valve rods are adjustable at the top in convenient manner. In the Buick design of head, the gas passages are very direct.

Buicks this year have a new type of aluminum cone clutch with a clutch brake that facilitates gearshifting. There are three small engagement springs to equalize the action instead of a single spring. The old form of clutch coupling has also been abandoned for a shaft that is a single piece of steel integral with the constant-mesh pinion of the gearset.

In the gearset special mention is made of the interlocking device which prevents any possibility of simultaneous engagement of two gears by improper or careless handling of the gearshift lever. The gearset bolts to the rear of the engine, forming the familiar unit-powerplant construction.

One of the 1915 models was fitted with cantilever rear springs and both the 1916 cars are so supported. These springs are diamond pointed and of such length as to promote easy riding. As in previous Buick design, the drive shaft is inclosed in a torsion tube, the front end of which is yoked to the back of the gearbox in such a manner as to give universal action.

The wheelbases are 115 and 130 in. for the small and large sixes, respectively, and while only roadster and seven-passenger touring bodies may be secured on the larger chassis, the smaller model includes sedan and coupelet types as well.

Cameron Still Water-Cooled

The Cameron company, having made one of the few air-cooled cars of America, last year changed over and adopted water cooling, turning out a light car of a generally conventional design. For 1916 this new model is being continued in five-passenger and two- or four-passenger roadster form with a 3 by 5-in. six-cylinder motor of the high speed type. Only the one model chassis is being produced with plenty of body space.

Chalmers One New Model

At the last New York show the Chalmers 6-40 with overhead valve, overhead camshaft motor was one of the novelties and it has been one of the cars of the year in that large numbers have been sold. Recently, a light six has been added of less unconventional design, and the two models together form the 1916 Chalmers program. The Chalmers Master Six, will also be made, but this is a very large car and is only expected to sell in small quantities.

At the present time the factory is very highly organized for the production of the two principal sixes and undoubtedly more of the light six will be made than has ever before been the case with any Chalmers design of the past.

The car has an L-head motor with detachable head and externally it is just a neat, simple looking job. Internally immense pains have been taken with the valves, the gas passages, the reciprocating weights and the lubrication, so that the engine is capable of high power for its size and a very high rate of speed. The crankshaft is literally enormous for the size of cylinder, so there is practically no vibration at any motor speed. The pistons are aluminum alloy, with special detail designed to prevent smoking and the connecting rods are very light forgings finished very highly.

An interesting detail is the peculiar fan, which is made from one piece of sheet steel and has two blades, and another is the separate unit assembly made of the oil pump and ignition distributer. The oil pump is external to the crankcase, where it has a chance to keep reasonably cool.

The dry disk clutch has a very light internal member which makes greatly for ease in gearshifting, and the gearset has exceptionally large roller bearings with a roller spigot bearing. Thence there is an open propeller shaft to the semi-floating Timken rear axle. The frame has a very wide and deep section for a car of this size, furnishing a very rigid support for the body.

In the body equipment modern outline is combined with ample space, but the body is well proportioned and not too big for the chassis. It holds its five passengers comfortably with plenty of extra space. High finish, and excellent quality fittings are characteristics. It is a peculiarly attractive car in appearance both as to the complete machine or as to the chassis alone.

Chandler Has New Light Chassis

For some considerable time the Chandler company have been upholders of the value of light weight in reducing running cost, and their chassis has been designed with a view to weight reduction wherever possible. For 1916 they will make but a single chassis in which the same principles will be observed.

An interesting feature of the motor is that the six cylinders are cast in two sets of three, a design which has many advantages and has been somewhat neglected by manufacturers. Also this is one of the new engines with silent chain front end drive. It is essentially a high speed motor since its maximum power is developed at a speed of about 2400 r.p.m., and a maximum car speed of 60 m.p.h. is expected of each car with standard bodywork.

The Chandler company make their own rear axle, which is a three-quarter floating type with spiral bevels, giving a 4.4 to 1 ratio.

It is perhaps worthy of remark that the manufacturers recently announced the close of a business year of unusual prosperity and plans for a large increase of output next season. A very substantial reduction in the price has been made. Bosch magneto ignition with a hand spark control is still used, but the lighting and starting equipment is new, being now supplied by Gray & Davis. Another small change is the substitution of semi-elliptic rear springs for the three-quarter pattern used last year.

Bodies include both touring or roadster types at the same price, and the equipment is in keeping with the general character of the car.

Davis Has Swing Seat

Moderate-priced cars, constructed of excellent components, the Davis chassis are conventional in design. The two power plants, differing slightly in size, are both Continental, Warner supplies the gearsets and Weston-Mott the rear axles. A feature is the use of a frame with perfectly straight side members.

With the bodies very special pains are taken, and the Davis designs are original. The touring bodies for either five or seven passengers have divided front seats which are entirely independent of the body sides, so that the driver's seat can be adjusted fore and aft over a good range. The seat for the front passenger revolves, so that the occupant can face either forward or can turn the seat round and face the tonneau passengers. Another style of Davis body is a clover leaf type of four-seated car, and in this also both the front seats slide so that the passengers in the rear seat have exceptionally easy access thereto.

Dorris Drops Four

In April, 1915, the first Dorris six was announced, this being an overhead valve motor with a peculiar starter drive, since the starting motor was arranged to operate through the front end gears, by means of a special intermediate gear. This model is being continued and a second six, of smaller dimensions now replaces the four. The latter is a more expensive car with a much higher speed engine, but the design generally is similar.

The dashboard in these cars is a part of the chassis and not a body piece, so all wiring, etc., becomes a chassis assembly. Another feature is locating the gasoline tank beneath the driver's footboards so that the filler and gage come flush with the floor where they are always visible, a Stewart vacuum tank being used to supply the carbureter. A full range of bodies is available for either chassis.

Franklin Features Lightness

The only car in the world with an air-cooled motor, save some quite small machines, the Franklin is but little changed for 1916. Air cooling, light weight, and full elliptic springs are the three main characteristics of this highly original chassis. This from the owner's viewpoint. To the engineer the car is doubly interesting because it is designed and made unconventionally, there being a very large number of individually small parts joined together by welding and riveting. For instance the flywheel, which is also the fan that draws air over the cylinders to keep them cool, is made up almost entirely from small pieces of sheet steel, the building process being rapid and easy with the special tool equipment used for the job.

This year the weight of the car has been cut still more by increasing the amount of aluminum used. The fenders are now aluminum and so is the hood, thus saving quite a considerable number of pounds. A detail which is also interesting is that the bevel used is neither straight nor spiral, but is a "skew bevel," the teeth being straight in themselves, but angular to the diametral line of the gear. The effect is much the same as is obtained with the spiral bevel with its curved teeth.

Franklin uses the Dyneto single unit starter system and the wiring is carried out rather more neatly than usual, every essential terminal being very accessible, in fact accessibility is markedly good throughout the car. Yet another originality in the chassis is the wood frame at either end of which the springs, which are of the full elliptic pattern, are attached by powerful clips.

Hotchkiss drive is employed, both torque and propulsive stresses being supported by the rear springs, and the flexibility of the spring is such that a very soft start is obtained even should the clutch be handled roughly; the bevel pinion can make half a turn or more without doing anything except compress the spring.

Glide Substitutes Six for Four

Throughout 1915 there has been but one model Glide, a four, and for 1916 there will again be but one car; this, however, is a six. It has a Rutenber, high speed motor with Westinghouse electrical equipment, unit power plant, an open type driveshaft and long, three-quarter elliptic rear springs with Hotchkiss drive.

A strong feature of the car is the equipment, which is quite extensive for a moderate priced car. A special type of sedan body is also available, which is convertible into an open touring car by detaching the upper structure. This operation is easily performed and the attachments such that both open and closed bodies are complete in appearance individually.

Grant Is Larger

The Grant six is a bigger and better car for 1916, but there is no difference in the price. Improvement has chiefly been in the power of the motor, and in the outward lines of the body, although there are a number of lesser mechanical refinements that add to the dependability and performing qualities.

The new body lines are the first thing to be noticed on inspection of the car. Cowl and body sides have been raised, and the slope of the bonnet conforms to the general line, with the radiator, still of the rounded form, of larger size. Increase of cylinder diameter from 2⅞ to 3 in., with the stroke remaining at 4¼ in., gives about 10 per cent more power, the displacement profiting by the enlargement to the extent of about 15 cu. in.

Instead of continuing to use the former mushroom type of valve tappets, the motor now has tappets of roller design, this change being made to eliminate the side thrust component on the valve rods, thus preventing wear and noise. Looking to the matter of accessibility, the method of assembling the tappets into the crankcase has also been changed so as to allow their removal without disturbing the camshaft or its bearings.

Overhead valves are used in the Grant engine, the head being detachable and carrying the rockers, springs and valves. In the cooling system, the only change is in the radiator, which is now of the form in which the shell and core are separate, the frame supporting the more delicate core against weaving or other causes that might spring leaks.

The design of the chassis is quite conventional and follows recognized good practice. The rear suspension is by well attached cantilevers, with the drive taken through a torsion tube that surrounds the driveshaft. Relief from somber hue is given by painting the cars in Brewster green this year, with only fenders and running gear in black.

Halladay High Speed Six

A new car, again with the very popular 3 by 5-in. six-cylinder engine, the Halladay is a soundly constructed chassis with good body equipment and fittings, selling for a moderate price. It has unit power plant, with Westinghouse lighting, ignition and starting apparatus, and Hotchkiss drive through long, three-quarter elliptic springs. There is

a wide range of open and closed bodies, the standard touring car being for five passengers.

Haynes is Light Chassis

Last year Haynes introduced a new light six car of which large numbers have been sold in 1915, and for next year the same chassis will be continued with but small alteration. The four-cylinder car listed last year has now vanished from the company's catalog. The Haynes is a distinctive car in that it is manufactured almost entirely in the Kokomo factory, motor, axles, gearset and so on being designed and built under the same roof.

In a general way the chassis follows conventional lines, having a very neat engine with the accessories neatly and accessibly disposed, a special detail being that the front end of the motor is hung from a shackle at the center of a forged cross member of the frame. For lubrication there is a combination splash and pressure system operated by a plunger pump. The carbureter bolts direct to the cylinder casting, as the intake manifolding is internal.

A large crankshaft is used and particular care is taken in fitting the bearings, the Haynes Co. being justly proud of the amount of skilled attention given to this important detail of manufacture. Light reciprocating parts assist the general rigidity of the design in keeping down vibration.

Hudson Entirely New

The 1916 Hudson is an entirely new chassis which will be known as the Hudson Super-Six. Enormous pains have been taken in developing this motor and the continued use of six-cylinders decided upon after many experiments with eight and twelve. Externally, the new motor has no striking peculiarities, being a block-cast six with 3½-in. bore and 5-in. stroke which is exactly the same size as last year. The power developed is stated to be 76 hp. maximum as compared with 42 of last year. To obtain this much higher power the principal alterations have been in reducing the friction resistance of internal parts of the motor and enlarging the gas passages and valves. Higher speed of rotation is rendered possible by the larger valves and vibration at the higher speed is prevented by the large dimensions of the four-bearing crankshaft. This new motor has been subjected to very severe tests and the new Hudson car has accomplished some remarkable speeds under official observation. The motor is claimed to develop greater power in proportion to its size than any other stock car motor ever built.

In developing the new motor a special type of carbureter has been designed, the ambition being to produce an instrument which will give rapid acceleration without delicate manipulation of the throttle.

The supply of oil is regulated by the speed, the throttle being connected to the oil pump in such a way as to regulate the stroke of the oil pump plunger. There is an eccentric in connection with the throttle which controls the distance between the pump plunger and the cam which operates it, reducing the clearance as the throttle is opened, and so giving more oil.

While interest naturally concentrates upon the motor, the chassis has received attention and is neater than ever. Hotchkiss drive is used with long semi-elliptic springs and the frame has straight sides which taper slightly toward the front.

Hudson has always taken care that the body work shall be expressive of the greatest comfort and the most modern ideas as regards outline and this principle has persisted in the design of the new car. Even better appearance and even greater comfort are to be found in the Super-Six.

Kline Kar is New Model

A six of rather shorter stroke than usual but otherwise on conventional lines is the 1916 Kline. Actually the motor dimensions are 3¼ by 4½ in., and 46 hp. at 2200 r.p.m. is the motor performance claimed for the standard product. The electrical equipment is all Westinghouse, lighting, starting and ignition. Two bodies, a five-passenger touring and a roadster for either two or three are offered at the same price and the tires are of good size, being 34 by 4 in.

Locomobile Has No New Chassis

Making some of the most costly cars now sold and specializing upon the most elaborate and beautiful bodies the Locomobile Co. but rarely introduce a chassis that is entirely new. At present they have two sizes of six-cylinder motor, the chassis being similar and not greatly different from former chassis of the same make.

Still there have been detail changes and for 1916 the Locomobile chassis are quieter, lower and better sprung. Great pains have been taken to eliminate any possibility of rattle, throughout the car, and the engine has been quieted by inclosing the valves and paying more attention still to the front end gears.

In the chassis there is one entirely new part, this being the dry disk clutch which now has sixteen plates and engages more easily than ever. The frame of the car has been lowered 3 in., and the running board brought down about half this amount.

Sundry improvements have been made in the dashboard fittings and switches, many of the latter now being arranged so that they may readily be operated by the driver's foot, fresh lamps have been added, one to illuminate the tonneau, and another lights up directly the door is opened, casting its rays upon the step.

For supplying electricity special machines are made for the Locomobile Co. by the Westinghouse Co., and the latter's magnetically operated pinion shift is used for the starting motor. This has a switch which is operated by a relay, so only a light push button has to be touched in order to start the car. Magneto ignition is adhered to, the system employed being Bosch dual.

In the gearset four speeds are provided, and the drive is the furthest possible removed from Hotchkiss driving since there are radius rods as well as a torsion member, and all braking stresses are resisted by the radius rods. An interesting detail is the use of two concentric brake drums.

There is a choice of either standard or custom built bodies, the finish in either case being the highest obtainable and the appointments of the greatest luxury.

Luverne is Large Car

Called by its makers the "big brown Luverne" this car is essentially a large machine with plenty of power and a roomy seven-passenger body of touring type. Large tires and a full equipment, including such desirable accessories as a power tire pump, are given. This is one of the largest cars using a single unit lighting and starting machine, a Splitdorf-Aplco unit caring for the 4 by 5 in. engine.

Madison Uses Rutenber

The Madison chassis is another in which the 3 by 5-in. Rutenber motor makes its appearance and is entirely conventional except that the rear springs which are three-quarter elliptic are really much above the average length. Seven, five and four-passenger touring cars are made, and a two-seated roadster, all mounted upon the same chassis.

For electrical equipment Remy apparatus is used, the generator being combined with the ignition distributer and the motor a separate unit. The chassis has a very clean outline and is singularly free from small attachments.

Marion Light Six Unchanged

The new series Marion was announced last May and has been a very successful car in 1915. It is considerably different from previous Marions, being a light chassis with 3 by 5 in. motor of high-speed type. It is an assembled car but one containing plenty of character, for the units are well

chosen to suit each other, and the arrangement is of thorough engineering character.

On the unit power plant the accessories, notably the Westinghouse generator and ignition unit are accessibly disposed, being mounted high up. The starting motor is also set on a level with the cylinders, the carbureter bolts direct to the cylinder block and the oil filler cap is brought up on the carbureter side close to the starting motor. The valves are on the right and the cylinder head detachable.

The axle is built up with a cast center case and tubular sleeves, and the differential can be removed by taking off the cover plate and then unscrewing four bolts. The three-quarter elliptic rear springs are taken beneath the axle and are extra long and wide to enable them easily to care for the Hotchkiss drive stresses.

The five-passenger body is kept reasonably short, so the back seat is not too far over the rear axle, a point which makes for easy riding. It is a streamline design with concealed hinges and flush upholstery. A distinctive shape of radiator casing and a low set top gives individuality to the front view of the car.

At the back of the body there is a very strong and rigid spare tire carrier of the internal type that supports the demountable rim without anything coming in contact with the tire itself. This carrier is so disposed as not to interfere with the gasoline filler cap of the round tank which is slung from the rear of the frame, a Stewart Vacuum tank being used to transfer fuel to the carbureter.

Marmon Has Aluminum Motor

There is not a detail of the new Marmon that is not new, though the car, which was described fully last week, has been in process of design for several years. It is a high quality, moderately high-priced car, about 1000 lb. lighter than the average of its class, and tests have proved it a remarkable performer on the road.

The engine, which is a six, has aluminum cylinders and pistons, overhead valves, and a detachable head. It combines efficiency and quietness with complete freedom from vibration to a very remarkable degree. In a brief review it is difficult to pick out specific details, but mention must be made of the oil throttle which is linked to the gas control and varies the oil pressure in accordance with the work the engine is doing at the moment. It is one of the neatest large engines ever made and there is not a single detail of it or on it that is not instantly accessible, the electrical equipment being particularly easy of access.

Then, the frame is a novel type, made of very thin steel and with the steel running boards used for their strength as part of the frame section. Each portion of the frame is calculated to be in the proper place to take the stresses on it and the waste material is thus cut to a minimum while the rigidity is aided.

In spring suspension, the rear end of the frame is connected to the axle by a pair of superimposed transverse springs which are set back to back with a device in mounting which eliminates all roll and also varies the period of the spring according to the nature of the shock encountered. The rear axle is built up from cold drawn steel tubes which are the last word in the art they represent.

The gearset is located on the front end of the torque tube and is so mounted on a ball joint that perfect freedom of motion is given the axle and yet the gear control lever is unaffected.

Then again, the body is built up in sections of aluminum, the frame being used as the base. There are no body sills. The upholstery of the body is detachable by detail so that a complete new set of cushions and seat backs can be put in in an hour. It would be possible to have a summer set of leather cushions and a winter set of cloth for example, and anyone could make the change.

The car has lines which will appeal to many as typical of the chassis and the high sides combined with low build give unusual comfort inside either driver's compartment or tonneau. The top is low set, and appears as an integral part of the design when erected, its lines harmonizing with those of the body. Altogether the car is one which every engineer show visitor will study closely.

McFarlan One Chassis Two Motors

One chassis with two motors of similar design but different size is the 1916 program of the McFarlan Co. The chassis is fairly costly and is a high class design made with the best workmanship, intended for the support of heavy bodies of luxurious character. The principal innovation this year is the adoption of very heavy, flat cantilever springs which have improved the riding quality.

The motors differ in little besides dimensions, both being T-head with very large valves. The speed capabilities have been increased by the adoption of aluminum alloy pistons and improving the lubrication by adding a plunger pump giving a pressure supply direct to the main crankshaft bearings.

Moon 6-30 and 6-40

Both these models are new this year. The chassis, which follow convention in general, are strongly similar, the main difference being in the size of the motors which are 3¼ by 4½ in., and 3½ by 5¼ in. respectively. The larger is very much like the 1915 model, the smaller having the new Continental light six engine, with a Delco starting, lighting and ignition system.

Hotchkiss drive is used for both chassis, a difference being that the larger has three-quarter and the smaller semi-elliptic springs. Full floating axles are fitted. The new bodies are full streamline form and the folding seats on the seven-passenger models are arranged to disappear completely when out of use.

Owen Magnetic Enters Second Year

When the Owen Magnetic with electric transmission was put fully on the market last year there were not wanting critics who predicted a speedy return to oblivion, but they have been utterly confounded, for the car has sold very well indeed, for a costly machine. During the year many tests and trials have demonstrated the practicality of the Entz system of transmission in which there is no positive gear connection between the engine and rear wheels. The 1915 chassis will be continued and a new, smaller one added, intended especially for town work.

The principle of the transmission is best explained in a few words by saying that there is a magnetic field created and rotated by the engine. This rotating field drags an armature around and so drives the propeller shaft. When running on "high gear" there is a very small slip, just sufficing to maintain the magnetic grip, but when the controller is moved toward a lower "gear" the slip increases and the electric current generated thereby is used in a second armature and a stationary set of field magnets to help drive the car. Transition from one step to another is by gentle gradation and the effect is that of providing an infinite number of speeds.

The mechanical portion of the chassis is of high quality and the manufacturers have produced some very attractive special body designs.

Paige Has Two Models

Early this year the Paige Co. announced a new series light six, 3 by 5 in., which would sell at a very moderate price, and the factory has been kept continuously busy ever since, at high pressure. The car is efficient, having plenty of power and running smoothly. Apart from the qualities of the chassis the body and hood together make an appearance which is almost universally approved, and the comfort suggested by

the outside is discovered to be a very definite fact as soon as a test is made.

The engine is a very neat block-cast six with a detachable head and two-unit Gray & Davis electrical equipment. The carbureter bolts directly against the cylinders without any manifold, the generator and water pump being driven in tandem on the opposite side. A high mounting is used for the starting motor which locates alongside the carbureter on the left side, and oil is circulated by a vane pump which is integral with the crankshaft, being situated at the extreme front end thereof.

Between the engine and the gearset of the unit power plant is a multiple disk clutch which runs in oil, and so operates with the maximum of smoothness. The rear axle is provided with a torsion tube, inclosing the propeller shaft, and this tube is used both to resist the torque and to transmit the drive, so relieving the rear springs of all stresses save those due to the load.

These rear springs are cantilevers of substantial dimensions and are credited with very satisfactory performance. Only the five-passenger touring body is supplied on this chassis, and it may be added that the high radiator, which is slightly pointed, is very distinctive indeed; the car is instantly recognizable.

The larger six has a similar chassis to the small one, differing mainly in the motor which has somewhat similar outline but a few internal differences, notably the use of a plunger oil pump instead of the vane type. The wheelbase is 11 in. longer and the tires 34 by 4 in. instead of 32 by 4 in. Like the smaller car the large chassis is supplied with only one body, this being a seven-passenger touring type.

Paterson Concentrated on Six

A new Paterson six with the Continental high-speed motor appeared in August and it is the maker's intention to carry on with this model. It is a conventional type of chassis with Warner gearset in unit with the motor and a Weston-Mott rear axle.

In designing the five- and seven-passenger bodies the Paterson Co. has provided extra width on all seats, and there are various neat details. One is the method for folding the extra seats into the back of the front seat, another the utilization of the left front door as a tool kit, all the more important spanners, etc., being neatly arranged in holders just beneath the leather flap on the door.

Pierce-Arrow Continues Three Chassis

Without substantial change the Pierce-Arrow 38, 48 and 66 six-cylinder cars will be continued for next year. In detail there have been some changes, however, and on lifting the bonnet the average man who knew the 1915 car would think that the motor was new altogether. This is because considerable trouble has been taken to smooth out details. For example the tops of the cylinder castings, which are still made in pairs, have been rounded off in a very neat way, making the motor look pounds lighter, and various small alterations of a similar nature have made for accessibility as well as for improved appearance.

The cone clutch interconnected with the gearshift lever so that gears can be moved only when the clutch is disengaged is used as before, and all models have four speeds with direct on high gear. Drive is taken by the springs with a torsion tube to care for stresses of that nature.

A very wide range of bodies is available for either of the three chassis these all being made on the Pierce-Arrow principle of cast aluminum units. These thin castings make panels and joints of a rigidity rarely obtainable by any other process, and the closed bodies can be subjected to the severest road conditions without any possibility of warping.

With these bodies the development of a rattle is practically impossible and the cast aluminum provides an ideal surface for taking the best class of paint, as it has a natural "tooth." The woodwork is just sufficient to support the upholstery and is attached to the aluminum panels rather than the other way about as in the ordinary body. The large number of limousines made by the Pierce-Arrow Co. five and six years ago, and still in service is proof of the lasting qualities of this special body system.

Premier Has Many Bodies

One chassis with a wide choice of bodies, six in all, is the 1916 Premier scheme. The chassis has a 4 by 5½ in. motor with cylinders cast in blocks of three apiece, a multiple disk clutch in unit with motor and gearset and a Timken full-floating rear axle. Delco or Remy electrical equipment is fitted and the tires are large, being 36 by 4½ in.

The bodies include the conventional types such as seven passenger touring and roadster patterns. Then there is a speedster, a clover leaf three seater and a coupélet, while a special four-passenger called the "yacht" body is supplied also. Particular care has been taken in designing these bodies which appeal to almost all tastes and one or another can be found to suit almost any conditions.

Republic Is Large Car

Almost unchanged in design the Republic 1916 series retains the T head motor with pair cast cylinders. It has a 133-in. wheelbase so is able to take large, roomy bodies. There are but few cars remaining with four speed gearsets and fewer still with four speeds and direct third, but the Republic still is provided with this equipment, the gearbox being mounted amidships.

Another departure from ordinary practice is that the service brakes are internal on the rear wheel drums, and the emergency brakes external.

Singer Has Large Powerplant

The Singer car which appeared on the market toward the end of 1914 is to be continued with but small changes for next season. It has one of the largest unit powerplants made, the motor being 4 by 5½ in. Four speeds with direct on fourth are provided and the big engine is tuned to run up to 2000 r.p.m. or over and it is claimed to develop in excess of 100 hp.

It is a large, fairly high priced car and seven different bodies are offered, a runabout, two touring models and two inclosed.

Stewart Is Neat Chassis

The Stewart car is the product of a firm who specialized on light commercial vehicles up to the present year when they commenced to make a passenger car. It is an assembled car using Continental motor and Timken axles, but it has a character all of its own, the chassis being laid out with quite exceptional neatness and convenience.

The radiator is located against the dashboard and the hood of the sloping pattern like the original Renault or the Franklin. The manufacturers pride themselves on the good finish of the bodies and on the springs, in the selection of which they went to great trouble to acquire exactly the right strength. The finished car is very distinctive in appearance.

Sun Is New Car

A new light six with the popular 3 by 5 in. cylinder dimensions, the Sun is an assembled chassis which will make its first public appearance at the New York show. It has Remy electrical equipment, dry plate clutch and Hotchkiss drive, while the rear axle has double expanding brakes in the rear wheel drums.

Velie Has One New Model

The Velie program for 1916 includes one continued chassis, the 3½ by 5¼ six of 1915, and one new car which is a lighter six with motor 3¼ by 4½ in. This engine is the very

EXAMPLES OF ALUMINUM CYLINDER CASTING—FIVE EXPERIMENTAL—ONE PRODUCTION

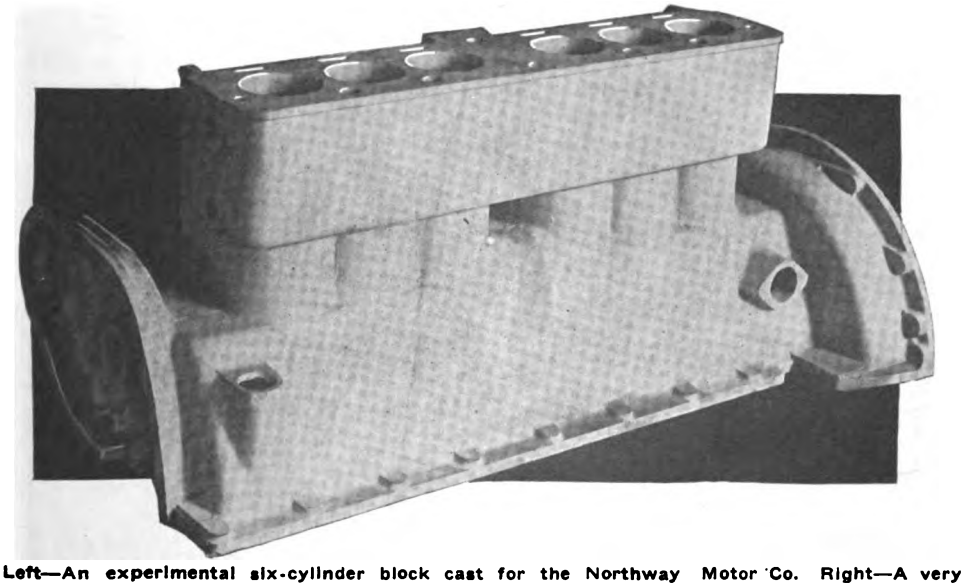
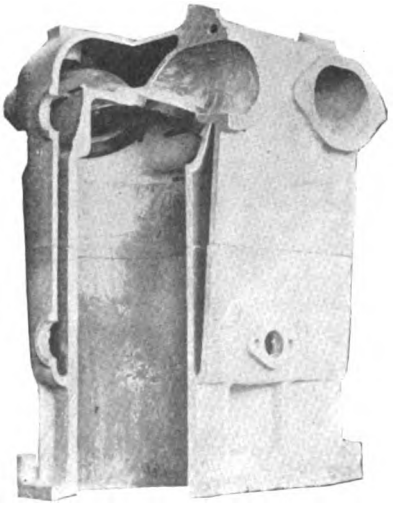
A Sterling four which has been running six months





Left—An experimental six-cylinder block cast for the Northway Motor Co. Right—A very large cylinder for a Wisconsin aeroplane engine

latest Continental and is a high speed motor. It has several typical Continental features in lubrication and detail design.

On both chassis the unit powerplants are supplied with the same clutch, a three plate pattern dry disk which is operated by exceptionally light pedal pressure. There is an easily accessible adjustment for spring pressure and there are two adjustments on the clutch pedal, one where it is keyed to the shaft and another on the pedal pad.

A very wide frame is used so that the body can be supported on a base of its own width without overhang at the sides, this being considered an insurance against the appearance of body squeaks. The rear springs come beneath the frame instead of beside it, and these springs pass beneath the axle; they are the only attachment between frame and axle, taking all torsional and driving stress.

Special care has been taken with the electric wiring, all wires being in conduits and the Remy equipment is used. The body is described as a boat shaped streamline of good width and generous proportions.

Westcotts Feature Bodywork

The Westcott novelties are two chassis which differ only in length and tire size, and a range of new bodies. The latter include a convertible sedan which is claimed to be one of the most perfect examples of this kind of body. With it comes a special windshield of limousine pattern, which can be substituted for the touring car shield when changing to the winter equipment. Another style of Westcott body is the three-passenger roadster with clover leaf seating, and this is also made as a cabriolet.

A very strong feature of Westcott construction is the adjustment provided on the pedals and also on the steering wheel. The pedals can be lengthened or shortened 6 in. and the steering post moved over a wide range, giving the effect of an adjustable seat, without the extra body weight and complication introduced by such a fitting.

The cars use Continental motors and a multi-disk clutch with a large number of plates. The gearset is in unit with the engine, and drive to the rear axle is by open type shaft with two universals and a torque stay. Cantilever rear springs are employed, these having extra short shackles at the front ends which is said to eliminate roll or side sway.

Many Options on Wintons

Making one chassis with two motors and of two wheelbases, the Winton Co. specialize in giving their customer a wide choice in luxurious bodies and in many smaller matters. For instance, each owner of a Winton is encouraged to choose the color scheme that he prefers for his car, and he may have either wood wheels or wire wheels as he may like.

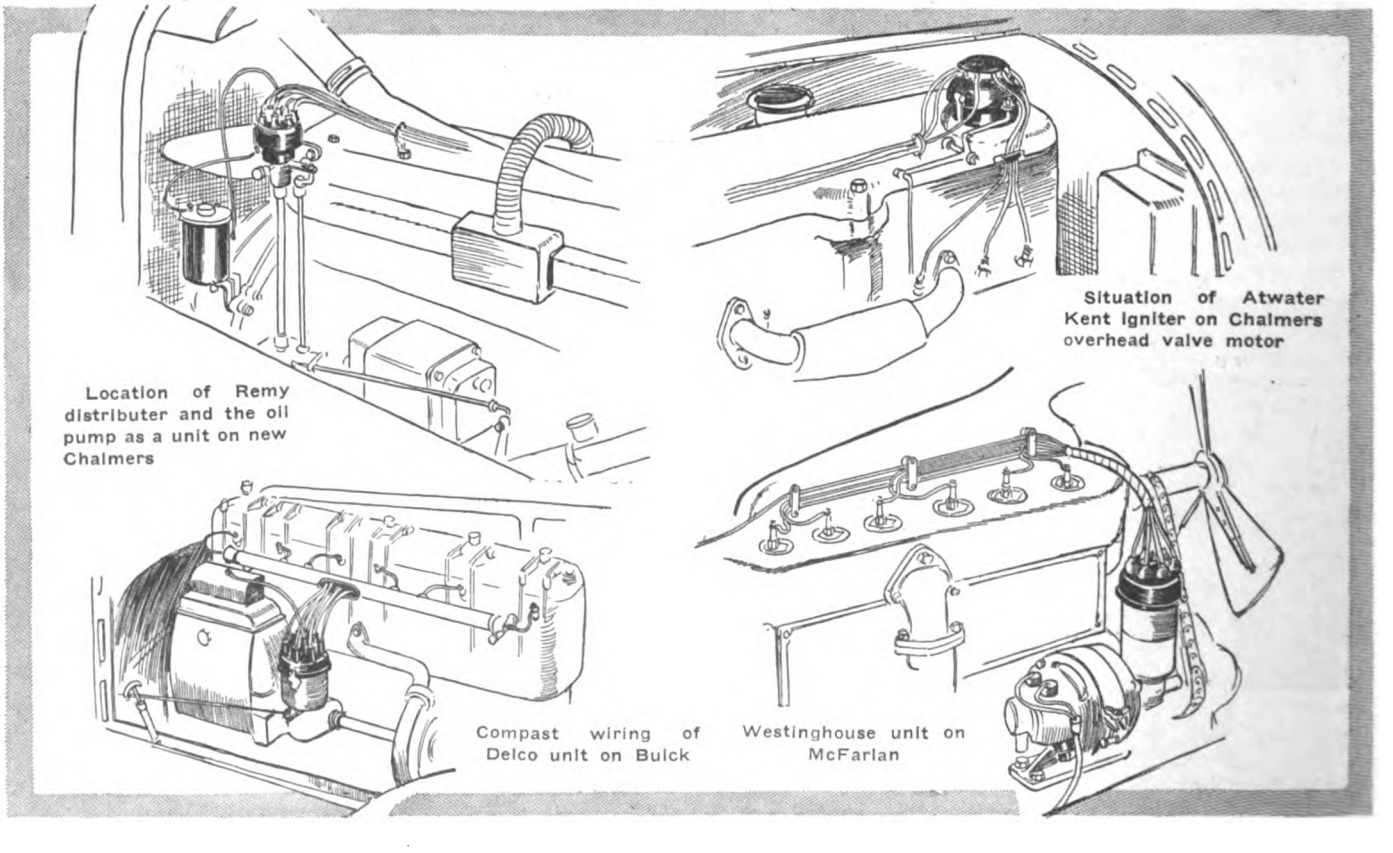
A rather unusual feature is the listing of cars with two bodies, say a limousine and a touring type, interchangeable on the same chassis, the price being less than for the second body as an extra if bought separately. All wiring is brought to a single connection on the dashboard so as to render interchange as simple as possible.

The power plants of both cars are distinctive in design, being of great robustness. Cylinders are cast in pairs and the crankcase has pans integral with it that completely fill the front end of the frame, excluding dirt and water and serving as a base upon which to mount the electrical units and the carbureter.

There is a multiple disk clutch which operates with light pedal pressure and both clutch and brake pedals are adjustable. Quick acting brake adjusters are provided by large self-locking thumb nuts.

A special point is made of the low suspension, the frame being dropped deeply in front of the rear axle, and the three-quarter springs slung beneath the axle. In all springs the Dann insert is used for the purpose of maintaining their original freedom of action, and it is claimed that the low setting of the car makes greatly for steadiness. Both motors are of large displacement and well able to take care of big bodies. Nine different body styles are available for either the large or small chassis, or the chassis can be bought alone for fitting a custom built body.

Four Comparative Studies in Wiring on New Cars



Section 3—Cars Made Only as Eights or Twelves

This Section Last Year Would Have Contained But a Single Name

Cadillac Shows Small Changes

PERHAPS the most striking thing about the Cadillac eight of 1916, is the absence of material change as compared with the 1915 model. A slight alteration in the body lines and a cleaning up of the V between the cylinder blocks so as to make the tappets more accessible are the two outstanding differences in a design which only the year before struck out on a new course as compared with previous practice in powerplant design in this country. It would not have been surprising if the Cadillac designers had found it necessary to make considerable change in the engine, in view of the fact that it was a design never before attempted by an American maker, but no fundamental thing was found wanting, and such differences as the type 53 engine shows are of a superficial nature.

With a great deal of frankness, the Cadillac company explains the increase in the price of the car from $1,975 to $2,080, on the ground that the original price was fixed before the production cost was definitely known, and later when it was found that this price did not give a reasonable profit, it was found necessary to raise the 1916 figure.

Chief among the motor changes are those which have to do with rendering the valves more accessible. This is done, first by moving the motor-generator back somewhat, and then by removing the power tire pump from the front end of the generator drive shaft and putting it on the left side of the gearbox. The ignition distributer, which was formerly in unit with the motor-generator is placed where the pump used to be, this shortening the motor-generator, and leaving more space on both sides of the carbureter. Further to aid the accessibility, the exhaust manifolds have been upswept instead of running straight back in line with the exhaust openings, bending away from the space between the cylinders instead of protruding into it.

A refinement of the ignition wiring adds to the dependability of the ignition. An aluminum cover goes over the distributer, and a wiring manifold runs from either side of it to carry the wires to the spark plugs. The distributer cover and wire tubes are held in place by spring clips.

Other mechanical changes include reducing the second speed gear ratio to give greater pulling power on intermediate; moving the brake and clutch pedals 2 in. forward to give more leg room; increasing the radiator height, and fitting mud splashers to the lower part of the radiator and along the inside of the frame front ends. The 1916 hood is higher and wider, and the sides of the body are also higher, giving the appearance of a larger car, although the wheelbase remains 122 in.

Cole Continues Successful Model

The Cole company have been so successful with their eight that it will be the only model this coming year. The motor has been improved by the adoption of a balanced crankshaft and will have a little more power, though of the same dimensions. The Cole was the first chassis to employ the Northway powerplant with the eight cylinders cast in two blocks each integral with one vertical half of the crankcase, the left portion bearing the crankshaft bearings, and this engine has proved itself so good that it is being continued as originally laid out.

A novelty in the motor since the summer is the introduction of aluminum alloy pistons of the "hourglass" type, which are particularly effective in preventing smoke. The pistons have also reduced vibration and given the motor still more "life." The Cole eight was also the first car to have a two unit electric lighting and starting system of Delco manufacture, and this they adhere to, it having proved highly satisfactory.

The Cole company pride themselves upon the high finish of their bodies and the quality of the leather upholstery used. The seven-passenger car with divided, individual front seats is above the average of comfort and there is still plenty of room even when the full complement of passengers is aboard. Not only internally, but externally also the finish is extra high so the Cole is generally reckoned a very handsome machine. Simple design has enabled the weight to be kept down and this, combined with the high engine power, makes the car very lively on high gear, official tests having shown that its accelerative power is decidedly good.

The wheelbase has been increased so giving 3 in. more length to the rear compartment, and the frame is of stronger section, so as to provide a body support of great rigidity.

Daniels Eight Robust Job

A robust chassis of simple outline with an equally robust Herschell-Spillman motor, is the briefest description of the Daniels eight, which is a new car only announced quite recently. The H-S eight has many special points of design, one being the use of the oil pressure relief valve to turn a stream of oil on the timing gears. Cylinders are staggered so as to allow the use of side by side connecting rods.

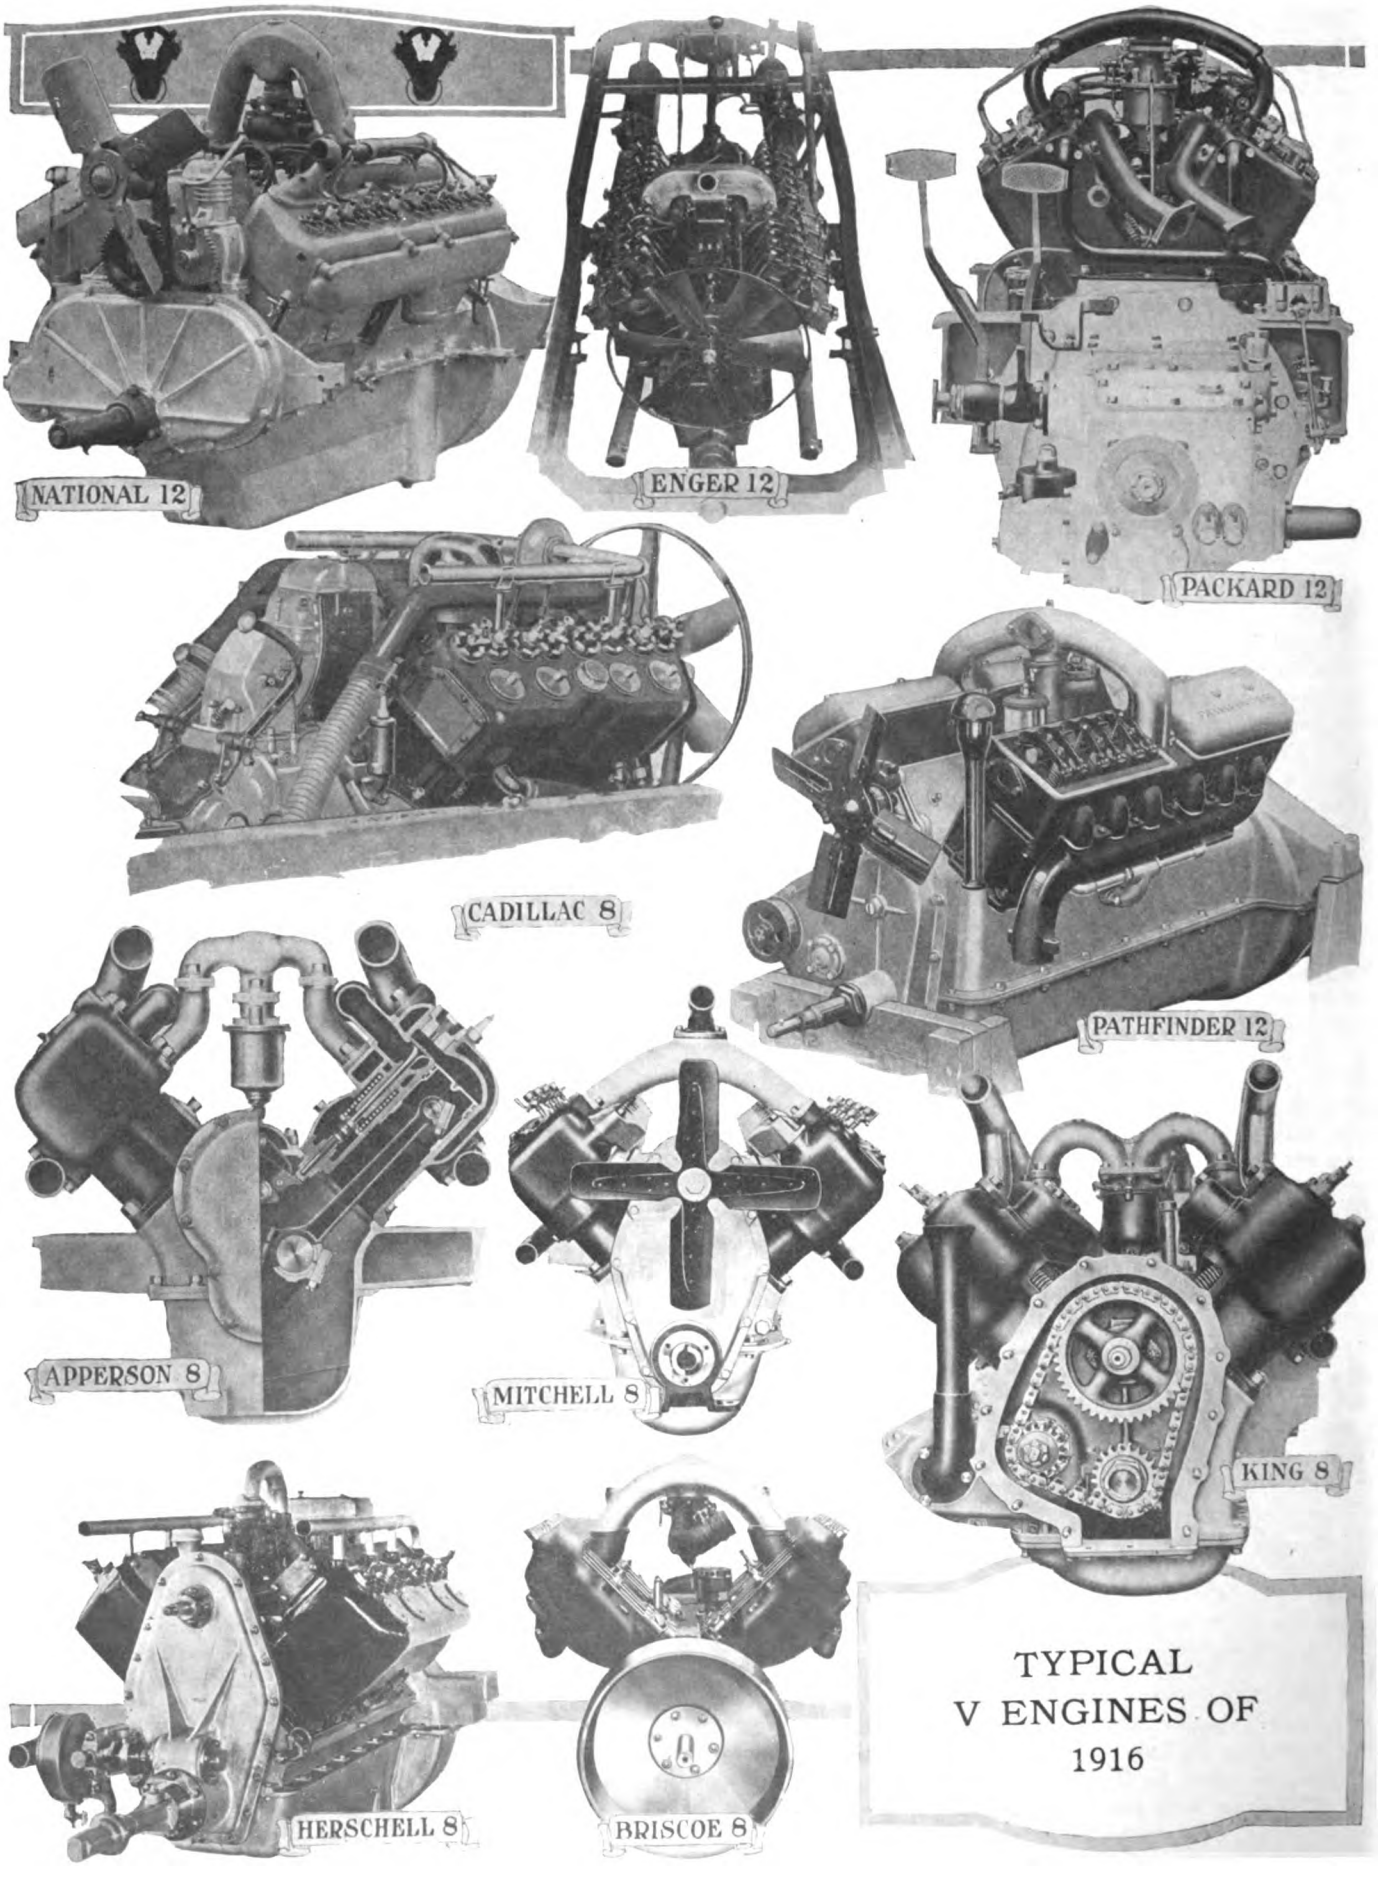
On this motor a Zenith duplex carbureter is mounted and the valve alley is otherwise clear of all incumbrance as the Westinghouse starting motor is removed to the crankcase side, the timer being arranged vertically at the rear end of the camshaft where it is very accessible and yet out of the way. For driving the Westinghouse generator a cross shaft is arranged at the front end of the camshaft, this cross shaft having the generator at one end and the water pump at the other, and the layout is almost ideal from the viewpoint of accessibility.

Being a fairly costly car the bodywork is of a high order of merit and the finish and fittings of the very best quality.

The chassis follows conventional lines and is entirely suitable for the heavy bodies which the motor power is well able to handle. A large choice of bodies is offered including two touring cars, a roadster, landaulette, limousine and sedan.

Enger Twin-Six Has Overhead Valves

The Enger Twin-Six is the only twelve cylinder specialized upon by any manufacturer save the Packard which was the first of this type. The Enger is distinctive in that it has overhead valves, operated from a camshaft located in the usual place, by long push rods and rockers, the valve tappet adjustment thus being made very accessible as it consists of



TYPICAL V ENGINES OF 1916

cap screws in the rocker ends. All twelve cylinders are cast in one single block with the upper part of the crankcase, and the cylinder rows are staggered to admit side by side connecting-rods.

Lubrication is thorough, oil being pumped through the hollow camshaft to the tappet mechanism and through the crankshaft for the other bearings. For the camshaft a chain drive is used and the fan is also operated from the camshaft. Short ignition wires are obtained by locating the distributer upon the camshaft at the upper end of a vertical shaft which drives the oil pump, this being situated in the crankcase near the center of its length. As there is no valve adjustment save that on the rockers the space in the V is utilized for the Westinghouse generator which is driven off the same shaft that carries the fan.

Another unique feature for a V motor is the use of the water-jacketed intake manifold as the outlet pipe from the cylinders, the middle of the manifold having the hose connection for the radiator. This is very neat and simple.

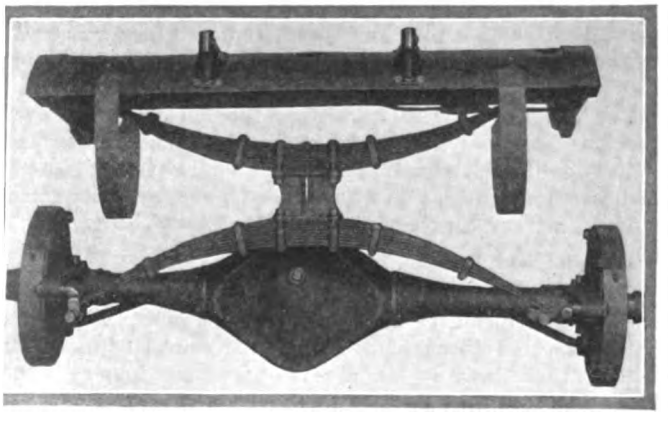
Hollier Is Small Eight

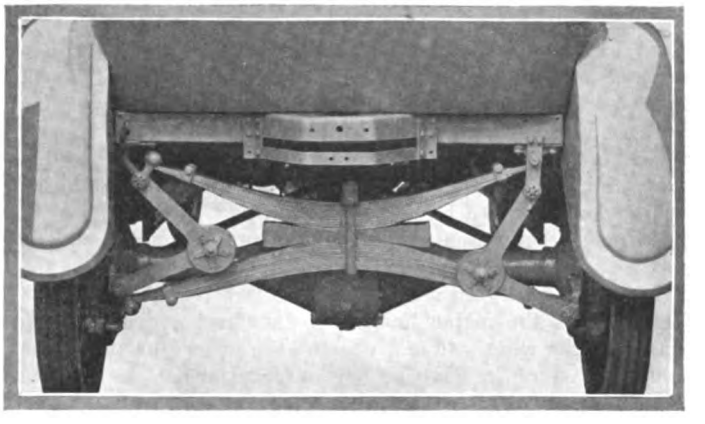
Long a maker of parts for other cars, the Lewis Spring & Axle Co. early in 1915 decided to stop working for others, and the result was the announcement of a new eight.

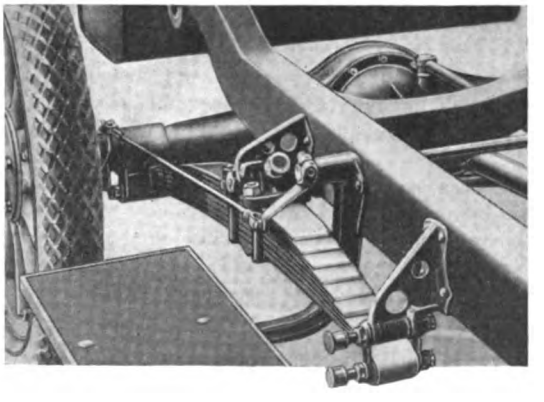
In the Hollier, simplicity has been aimed for without sacrificing stamina, and the car is a good example of what can be done in the manufacturing of a low-priced car with a multi-cylinder engine. Accessibility to the valves is specially noteworthy in this engine, because there is nothing in the V between the two blocks of cylinders save the carbureter and the combination oil filler and breather pipe. The starting and lighting unit is attached to the yoke passing around the flywheel, at the right of the gearset, and is thus out of the way, though readily accessible.

Unlike most connecting-rod constructions whereby either the forked-end design or the side-by side arrangement are

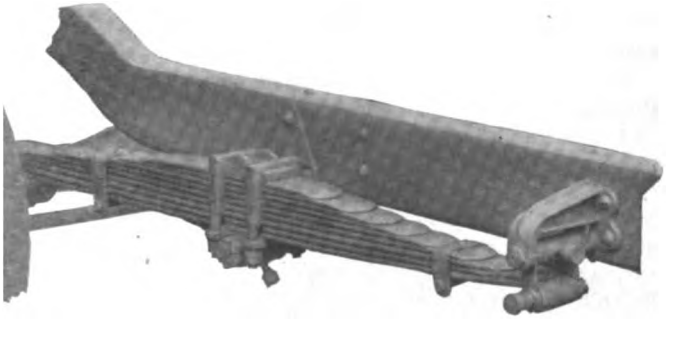
Some Novel and Contrasting Rear Spring Suspensions

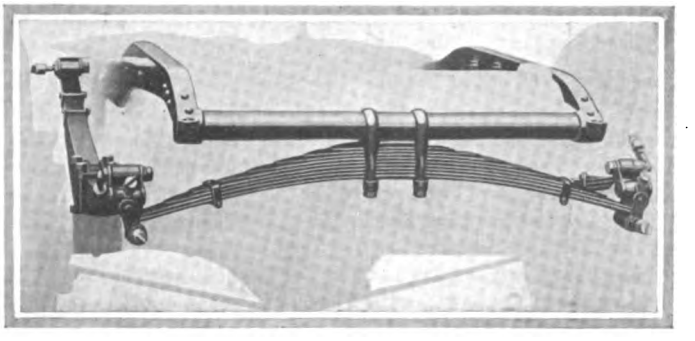






Top, Left—The rear springing of the Moline-Knight. Top, Right—That of the Marmon. These two systems are essentially the same in principle, being the latest development of transverse springing. In both cases the two springs differ in length, which means that the upper spring has a faster period of vibration than the lower and is consequently affected by shocks to a different extent. In both cases the springs are attached rigidly to frame and axle at one side by simple bolts through the eyes, and are shackled to axle and frame at the other side. In the case of the Moline there is a rigid separating piece between the two springs, but the Marmon has a wood separater which is cut to a curve as shown. This has the effect of spreading the base of support on the spring centers as the springs give under load. The effect of this spreading is to shorten the spring and make it increasingly harder as the depression due to shock increases





Left—The National cantilever spring which is particularly free from roll, this being said to be due to the high mounting and the nearly flat shape. Center, Above—King cantilever shackled to axle and with middle clip well forward. Right—The Cadillac platspring suspension

used, the Hollier designers chose what is termed the Gnome form of rod attachment. One rod has its entire bearing on the crankpin, but it has forged on its side a knuckle or boss that takes the other rod. The valves are operated by a single camshaft, which, together with the rockers, is assembled to a plate that bolts to the top of the crankcase between the blocks of cylinders. Drive is by helical gearing. The timing gear housing also acts as a mounting for the fan, and for the fan driving pulley, as well as a support for the front end of the engine and the mounting of the starting crank.

As standard bodywork a very neat five-passenger equipment is supplied, this being nicely proportioned to the chassis. There are not many unconventional points in the design aft of the motor except the cantilever rear springs. Also the rear axle has two sets of expanding brakes, there being two drums one within the other.

King Has Two Eights

The King eight introduced last year is being continued with a few small refinements, these being mainly in the body. The motor is of the type in which forked connecting-rods are used and another feature which has proved its satisfactory nature is the cantilever rear suspension.

A new model, also an eight has just been announced, this being intended for seven-passenger bodies; it is a slightly more costly car and the motor is quite different in detail. Instead of the forked connecting-rods the side-by-side pattern are employed, and the cylinders are staggered slightly to permit this. Light aluminum pistons, of a special design which prevents any possibility of smoking, are used, and the engine is intended to have a high speed capacity.

Geared rather lower than most, the careful engineering is apparent in the lack of vibration when running fast and the makers are justly proud of the accelerative ability. The front end of the motor has chain distribution gearing, one chain for the camshaft and one for the generator the latter being driven off a double idler sprocket which is used to adjust the camshaft chain.

High pressure lubrication of the most modern sort is used and the engine is conspicuously clean in appearance there being no accessories in the valve alley. This is done by placing the vertical timer shaft at the rear end of the camshaft and locating the generator low down on the crankcase. The starting motor is mounted on top of the clutch housing, and the tire pump on the side of the gearbox. As a result the valves are perfectly accessible.

Another point of peculiarity is the use of a transmission shaft brake, just aft of the gearbox, this being connected to the emergency lever. The cantilver springs used on the earlier model are again employed for the new car, but a modification in the mounting has allowed the frame and body to be lowered quite perceptibly without affecting the clearance.

The folding steering wheel used on the other King cars is continued for the smaller car, but is not used on the other, as the greater amount of space permits an easy entrance on the driver's side without a special wheel. The King company is one of the two firms making V type motors only that has two sizes available.

Packard the Original Twelve

As the first twelve-cylinder automobile ever put on the market the Packard will be one of the newest things in the show and ranks as one of the most important engineering accomplishments of the year. It is the first Packard car with a unit powerplant also as this firm hitherto adhered to rear axle transmissions.

The engine teems with novelty for besides being a twin-six it has a chain front end with a particularly ingenious adjustment, one of the most elaborate lubrication systems ever devised for an automobile engine and a Lanchester vibration damper which eliminates the last trace of quiver from the motor at any speed, from the lowest to the fastest. Every portion of the motor where there is motion is lubricated from the pump, even the spindle of the little air pump which supplies air for the fuel feed is lubricated positively. A robust crankshaft, large valves, and light aluminum pistons, together with the efficient Packard carbureter give this motor a very wide range of speed so the car is one of the most speedy on the market. The car can be started from rest on the starter, with high gear engaged and will pick up without hesitation once the motor is warm.

Despite a substantial drop in price the quality of the chassis detail, of the body and the equipment has been kept well up to Packard standard, and even improved upon in some respects. A very wide choice of bodies is available and the body fittings are most luxurious.

The left hand steering wheel and extreme left hand gear shift and emergency brake levers, now used by Packard for some years, are retained for the twin six, the engineers believing that this makes for comfort, and it certainly does allow the wide front seat to be used comfortably for three passengers abreast.

Another leading feature of the Packard is the centralized control upon the steering column, everything being brought to the one spot. One switch controls the lights and it is the work of an instant to change over from full headlight power to the smaller lamps which are made up integral with the large ones, but with separate reflectors.

For the first time in its history the Packard company is specializing on only one model of chassis, though this is made with two different wheelbases; on the long chassis the standard seven seated body is fitted, and the short chassis accommodates a very cosy close-coupled five seated body.

Peerless's New Eight

The recently reorganized Peerless company will make but one passenger car for 1916 this being an eight, which is to be constructed throughout at the Cleveland plant. There will be three body styles, a seven-passenger touring car, a limousine with the same seating capacity and a roadster for three. Being 3¼ by 5 in. the motor should have plenty of power and it is neatly laid out having all the qualities of design dictated by sound engineering practice. Lubrication is full pressure, with no splash, and dual ignition is provided with an automatic spark advance having a hand control superimposed.

The powerplant is a unit, with a multiple, dry disk clutch and three speed gearset and the rear axle a Timken semi-floating pattern. One point in the design which is less common to-day than some years ago is the use of a platform spring at the rear and it is also noteworthy that the drive is taken through the springs, there being no torque or radius rods. Lighting and starting is performed by Gray & Davis units and a special design of carbureter is fitted.

Being a moderately priced car the equipment is thorough, and includes tires 35 by 4½ in. on all four wheels. It is the intention of the manufacturers that the new model shall in every particular be suited to the maintenance of the company's name in the automobile world.

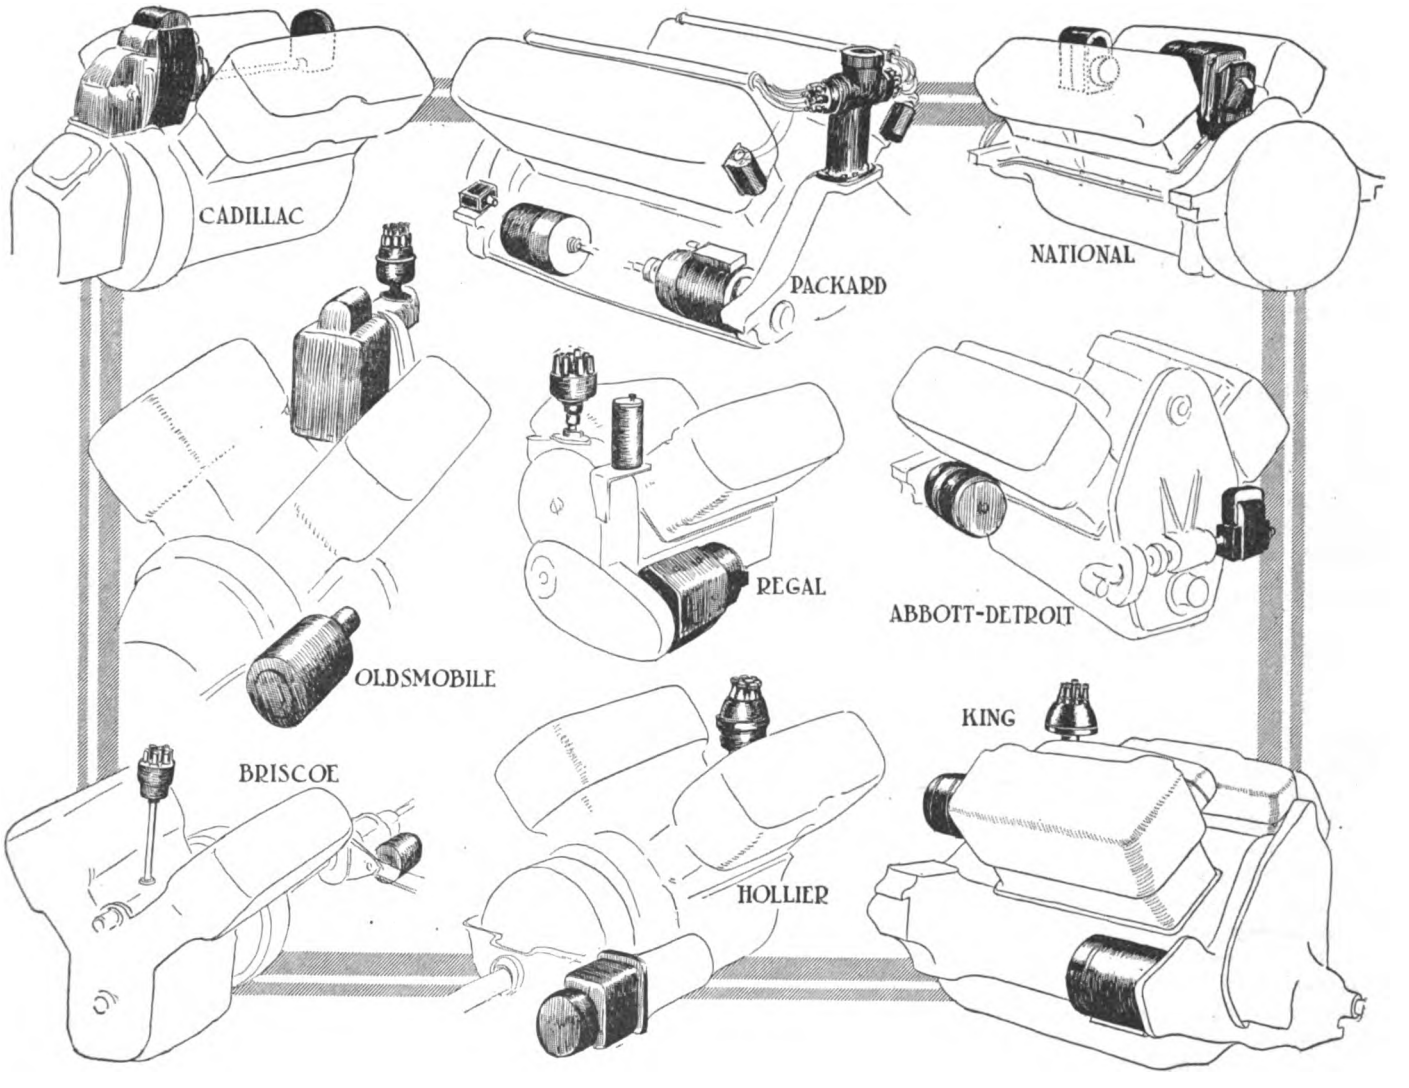
Ross Has New Model

There are now two models of Ross eight, one 3 by 4½ in. the other 3¼ by 5 in. Both motors have chain front ends and the smaller thermo-syphon cooling, the larger engine being provided with a centrifugal pump. Full pressure lubrication is used for both models. Touring bodies of five and seven-passenger capacity are fitted. The two chassis are generally similar, but the larger has three-quarter rear springs as compared with semi-elliptic on the smaller. A Detroit Starter Co. electrical equipment has been fitted in place of a special design used previously.

Another feature of the smaller car is a multiple disk clutch running in oil this excellent type being now somewhat rare.

Location of Accessories on V Motors

A Comparison of Accessibility of Electrical Units



THE accessibility of the accessories on V motors has been a cause of much discussion during the past year, and the various manufacturers claim special points of advantage for the arrangement they adopt. In the sketches above nine different ideas are displayed, the generator, the starting motor and the ignition distributor being indicated by diagrammatic forms in each instance. In every case the carbureter, which is not shown, is situated at the center of the V and midway of the cylinder length.

A little amplification of the sketches is necessary. The Cadillac has a single unit electrical equipment, with the distributor the only separate part, so all the electrical apparatus is in the V. In the case of the Packard the generator and the starting motor take a normal placing on the crankcase, and the ignition unit is in the same place as the Cadillac. The National, having the valves outside, has the magneto and the starting motor in the V, the generator, not shown, being on the opposite crankcase side.

Oldsmobile has a one-piece generator and ignition unit at the front end of the V, with a starting motor on the bell housing, and Regal uses a single unit generator and starting motor, with the distributor mounted extra high in front of the cylinders. The Herschell-Spillman motor of the Abbott-Detroit has a magneto on the cross shaft in front and no apparatus in the V, which assists the valve accessibility.

Briscoe has taken the single unit generator and motor back to the gearset, where it is entirely out of the way, leaving the distributor as the only electrical fitting on the engine, and Hollier uses very much the same design. King, on the other hand, uses a normal placing for the generator and mounts the motor on top of the clutch casing, having the distributor at the back end of the V close to the dashboard.

Section 4—Cars Made with More Than One Type of Motor

This Is a Rapidly Decreasing Class Though Still Containing Many Names

Abbot-Detroits Both New Models

A SIX and an eight form the Abbot-Detroit 1916 line, the former made with touring, roadster, speedster and sedan bodies and the eight with either touring or speedster equipment.

These are not one chassis with two different motors, but are two totally separate designs, even the starting and lighting outfits are different, being Remy on the six and Auto-Lite on the eight. In wheelbase there is but an inch of difference, but the piston displacement of the eight is a good deal the greater. Both are robust chassis with good equipment, thoroughly up-to-date in detail but with no especial peculiarities of design.

On the eight, large tires and big brakes are features and the electric storage battery has a capacity a little above the average, which is always advantageous.

Apperson Has Six and Eight

One of the fine old firms of the industry, the Apperson products have always been free from experimental engineering. The factory, though not very large, is one of those in which almost every part of the car is made and in consequence the Apperson cars are distinctive in every detail. In the eight care has been taken to make the crankshaft and its supports so stiff that periodic vibration is impossible, and the smaller detail of the motor is well thought out and carefully arranged. The oil indicator, for example is a particularly simple and effective adjunct.

The six is similarly well thought out, both cars displaying, by their design, that the engineers responsible for it are men with long road experience, since the convenience of the driver is studied throughout. Touring bodies and a very neat four-passenger roadster are made, the latter being a development of the clover leaf, three seater. All four passengers are in close proximity and can converse together, while each has plenty of room for comfort. Also the body is usually considered very attractive in appearance.

Auburn Line Is Two Sixes and a Four

Though not having a very large output the Auburn Co. ranks high among the older firms of the industry. Their chassis are always eminently sound in design and in workmanship and free from any doubtful features. Reliability is a keynote of Auburn workmanship. The three 1916 cars rank in the medium price class, the four is a very handy size of machine with a motor possessed of plenty of power. It is made in five-passenger and roadster form and has large tires with a cantilever rear suspension. The two sixes are generally somewhat similar, both being of 5-in. stroke, the smaller of 3-in. bore and the larger 3½ in. There is also a difference in the electrical equipment as Delco is used on the big six with Remy on the small six and the four.

All three models are new this year, and the cantilever springs which last year were not employed are now used on all models. Floating rear axles are now fitted to all three cars and on each the drive is through the springs with a torsion tube in addition. Last year the body lines were modernized and improved very greatly and this characteristic holds good for the coming season.

Both the sixes have L-head motors and integral intake manifolds, but the four is still a T-head, though the manifold is integral on this motor also, rather an unusual feature for a T-head construction, by the way. There has been a price reduction on the four, and the big six is also cheaper than the 1915 six. The light six comes between the two and is not directly comparable with either 1915 model.

Briscoe Is Four or Eight

Briscoe is one of the manufacturers who has so designed its 1916 chassis that either a four- or an eight-cylinder motor is interchangeable in it. The idea is to furnish the customer either an eight or a four as desired, and if he chooses a four and within 30 days decides he would prefer an eight, the Briscoe company will replace his four with the eight for $200 additional. In order to make this possible with the least amount of trouble, the gearset has been separated from the engine and placed amidships so that only the power unit itself has to be taken out, either motor coupling to the drive shaft ahead of the gears.

A new design of four-cylinder motor is used in the 1916 car, 3 7-16 by 5 1-8 in., which gives a horsepower of 38 at 1700 r.p.m., it is claimed. The eight that is supplied is the Ferro, which has overhead valves and the upper part of the crankcase in unit with the two blocks of cylinders. Its dimensions are 3 by 3 1-2 in., which give a displacement of 198 cu. in., as compared with 190.4 cu. in. in the four.

In outward appearance the 1916 Briscoe is readily distinguishable from the previous model. This is principally due to the larger body and wheelbase increase to 114 in. from 107 in.; the fitting of two headlights instead of the former unique method of placing one headlight in the top of the radiator; the use of domed fenders and the suspension of the rear by cantilevers instead of semi-elliptic springs as used in 1915. Tires have been enlarged to 32 by 3 1-2 from 30 by 3 1-2, and the old design of double internal expanding brakes has given way to the more conventional internal and external form, these being considerably larger and more powerful.

Empire Adds Six

Never till recently has the Empire company built a six-cylinder car, but for 1916 they have a light chassis of this type in addition to their well-known four, which has been largely remodelled. The new four has a T-head motor in place of the L-head type used last year, and a greatly increased power is claimed, since the new engine has very large valves and all the other aids to high speed revolution. Otherwise the main features of the four-cylinder chassis are but little altered.

The six adopts the new, small Continental motor, which is also a high-speed type, and a very clean, rigid engine. This motor has a bore of 3 1-4 in. and stroke 4 1-2 in., which is a difference from the 3 by 5-in. six which was originally scheduled for this model. The chassis is remarkably clean in outline as the storage battery is the only attachment to the

frame excepting the four springs and the unit powerplant. To the four either touring or roadster bodies are fitted, but the six is at present listed with a five-passenger touring body only.

Fiat Has New Bodies

With their four- and six-cylinder chassis the Fiat company has made practically no changes, the only two alterations being to the universal and the steering ball joint, of which both have had slight improvement directed toward increasing their durability. The Fiat design is strongly similar to that of the Italian cars of the same name, and is thus largely different from conventional practice in America. The main object is to provide high efficiency and great durability, these features being obtained with a very graceful chassis.

Though largely sold with custom-built bodies there are some standard Fiat body equipments and these have been considerably changed. One new model in particular, known as the Riviera, is a molded design with a small central cowl, and has the hood shape continued rearwards till it merges imperceptibly into the more square tonneau.

An extensive use of very high tensile chromium steels is a characteristic of the Fiat chassis and many steel parts are hardened which are not so treated in conventional practice.

Herff Brooks Six With Single Cylinders

Making a four- and also a six-cylinder motor the Herff Brooks company are still protagonists of the singly cast system for their engines. The six-cylinder motor has seven crankshaft bearings and develops its maxium power at 1500 r.p.m. while the four has five main bearings and is rated to give maximum output at the same speed.

Splitdorf magneto ignition is employed and Apelco two-unit electrical apparatus for starting and lighting. Both chassis have unit powerplants with cone clutch and three speeds. For the rear axles a special design, manufactured by the company, is used, this having straight bevel gears and double internal brakes. Listed with either touring or roadster bodies the two cars sell for very moderate prices.

Jackson Has Wide Range

A four and no less than *two* eights is the Jackson line for 1916. Both eights use the Northway powerplant the larger being a motor which has been greatly favored during the year and the smaller a new type which is strongly similar in design. These engines are unique in that the cylinder blocks and the right and left halves of the crankcase are integrally cast, the division being vertical. The motors have detachable cylinder heads which are a great convenience for valve grinding or cleaning out carbon.

Another Jackson feature is the use of full elliptic springs both front and rear and these are very rigidly attached to the frames. Rather more clearance than usual is allowed so that the springs have an extra wide amplitude, making for easy riding on rough roads. Also the steering lock is extra wide for convenience in narrow roads and on mountains.

The Jackson company pay rather special attention to the bodies of their cars, which include some roomy roadsters having large rear boots which will contain a sufficiency of baggage for quite long distance touring. They also make a special trans-continental type which has a device whereby the back of the front seat lets down and, with the cushions, makes a comfortable bed.

Jeffery Has New Four

The Jeffery Chesterfield six has been so successful that it is hardly altered for 1916, but the four-cylinder car has been remodelled almost throughout, to meet the demand for a lower price and still more power. The new car has a slightly larger motor than the old model, and a striking change is the adoption of a unit powerplant in place of the amidships gearbox which has previously been a Jeffery feature. This gearset has three speeds instead of four, and the change over to unit powerplant is also accompanied by the adoption of a new clutch which is a dry disk pattern.

The rear axle too, is novel, being a semi-floating type with a cast differential case and large, conical steel sleeves, drive is on the Hotchkiss principle with long, three-quarter elliptic springs. Back of the gearset there is a powerful transmission brake, operated from the emergency lever, this being a contracting brake, as are the brakes on the rear wheels.

It is instantly noticeable on looking at the chassis that the frame sides are straight from end to end, but the body is laid out so as to have ample width. The body sides behind the cowl are quite straight on the seven-passenger car, and the front seats are divided. These seats have high backs which are curved like an arm chair but there are no high sides. A wide choice of bodies is given including five- and seven-passenger sedans, for which the chassis has plenty of power. Although so new in general aspect, the proved features of the motor have been little changed, barring a new camshaft which is a factor in the increased power output.

Lubrication is combined force feed and splash, a plunger pump feeding the main bearings and also supplying dip troughs. An addition to the lubrication scheme is the provision of a lead from the pump to the bearing of the idler gear in the timing case, in order to make sure of the durability of this journal.

In equipment a new one-man top is supplied and a Carter fuel feed tank to raise gasoline from the cylindrical gas tank at the end of the chassis. The windshield is a new model, and the cowl board bears a new oil gage. In front of the dashboard there is a terminal block containing the fuses, and the electrical equipment is now two unit Bijur.

Kissel "All Year" Car

The Kissel company have a strong feature in their "all year" body which is either open as a touring car, or closed as a limousine, the upper structure being readily disposed of, leaving a fully open car. When closed either coupé or sedan effects are produced. Other types are available, but the Kissel company very rightly pride themselves upon their all year design with which they have been doing exceedingly well.

The four-cylinder chassis was a new introduction quite recently, and the six is a development from the 1915 car. The motor is Kissel built and a high speed type having block cylinders with integral intake manifold. Special care is taken to eliminate vibration, first by using a strong crankshaft and a rigid crankcase, and secondly by balancing up the set of pistons and rods for each motor, so that there shall be no preventable tendency to vibrate. Very large valves are used, these being more than half the cylinder bore in diameter, and have nickel steel heads on carbon steel stems.

The rear axle, which is also specially designed has two points of interest. The most obvious is that the brakes are double, side by side, but are external to the drums and not the expanding type, while the other feature of note is the remarkable length of the bevel pinion shaft, giving great rigidity to this important detail of the chassis.

Returning to the all year bodies, the tops of these have frames of heavy white ash and elm, with sashes of mahogany. The frames are covered with sheet steel and aluminum and the roofs are three ply whitewood covered with canvas. It is claimed that the materials used for the roof and its construction are such that warping is impossible.

Inside, the fittings are luxurious. Leather trimmings are employed, there are dome lights, and the other attachments are of an artistic nature. Best plate glass is used for the windows and the paintwork is of a high order of merit. On the two chassis twelve different body styles are available; three on the four and nine on the six.

Lenox Has Fast Roadster

There are not many firms who make a [illegible] car, but this is done with the Lenox sp[illegible]

large four, 4¼ by 5½ in. and is claimed to be able to do 65 m.p.h. in stock form. Although a speedster it is a thoroughly equipped car, having a top with curtains and a windshield, etc. There is also a starting system and Westinghouse battery ignition. The car commands a fairly high price.

The other Lenox is a six which is a five-passenger car, also intended for fairly rapid travel. Both cars are geared moderately high, the four 3.25 and the six 3.75 to 1.

Lexington Has Two Sixes and Four

The Lexington company do not designate their cars by years, believing that the annual change idea is outgrown. The four was a fresh introduction last year when the motor was changed for a Teetor high speed T-head powerplant, and this same engine is still being used. The six was also new about a year ago and, like the four is being continued with but little change in specification.

Of the sixes, one is a continuation from last year, practically unchanged, while the other is a new chassis with a 3¼ by 4½ in. motor and 116-in. wheelbase, selling for a most moderate price.

The Lexington cars have a particularly interesting detail in the Moore multiple exhaust manifold, which is fitted to both models. This exhaust branch is so cast that the gases escaping from each cylinder are provided with individual passages and cannot interfere one with another, the idea being to relieve back pressure as much as possible. It is considered by many that this manifold even allows one cylinder's exhaust to exercise some extractor effect upon the next.

Three and six-passenger bodies are provided for the six, and a five-passenger body for the four-cylinder chassis.

Loziers Unchanged

Neither the six- nor the four-cylinder Lozier is a new car, the makers adhering to their policy of making very sound chassis selling for a good price. The four is offered with touring and roadster bodies and the six with touring body only.

Special pains are taken with the equipment and the four is supplied with an extra tire as well as the demountable rim. A feature of the four is the use of a four-speed gearset with direct on third, but this is deemed unnecessary for the six, which has but three speeds. The axles are also different, the four having a pressed steel case and the six a built-up pattern, both being full-floating. Magneto ignition is used for both cars with a Gray & Davis starting and lighting equipment. Both cars have multiple disk clutches running in oil and pressure lubrication, the four being full pressure without any splash and the six being provided with dip troughs as well as the pump feed to the bearings.

Mitchells Are New Eight and Six

The 1916 Mitchell chassis both for the eight and the six is very much the same as last year, but the two engines are quite new. The Mitchell chassis is assembled on the two-unit system, that is to say the motor has a three-point attachment to the frame but does not carry the gearset, this being a portion of the transmission unit. It is not a rear axle gearset however, as the gearbox is located at the front end of the torque tube which incloses the driveshaft, everything centering upon the single universal, which is situated between the clutch and the gearset.

Cantilever rear springs are now used for both cars and the wheelbase is the same, 125 in.

An interesting point about these cars is that both eight and six sell for the same price; the purchaser of a 1916 Mitchell can choose his car first and then make up his mind which type of motor he prefers to have. There is a wide choice of body styles and a full equipment, while larger tires are inclusive in the price of the limousine.

In design, the eight cylinder motor is distinctive and uses the intake pipe as the water outlet also, the manifold being of duplex form. Cylinders are L-head blocks bolted to an aluminum crankcase, and the connecting-rods of the forked pattern. Very large valves and quick lift cams give the motor a high speed ability. In general respects the engine is simple and an instance of this simplicity is found in the timing gears of which there are but three. The crankshaft pinion meshes directly with the camshaft gear, and above the latter is another pinion that drives the generator and the fan. These gears are fed with oil direct from the pump, which assists to keep them quiet, and special pains are taken in the factory to select the gears for quietness, many changes being made if the test run shows the original set to be the least below standard.

A big Mitchell feature is the remarkable accessibility of everything. Firstly all accessories are arranged with accessibility strongly in mind, and then care is taken that no part of the body interferes.. For instance, the floor boards are readily removable, so as to give access to the clutch and universal, which being so far forward is in an ideal position for greasing. Also, not content with this, removal of the seat cushions discloses a sort of lattice work which is a removable frame thus the whole chassis can be laid bare in a few moments. Yet again, another point of exceptional convenience, the tool box is a steel case, fixed between the frame side and the motor.

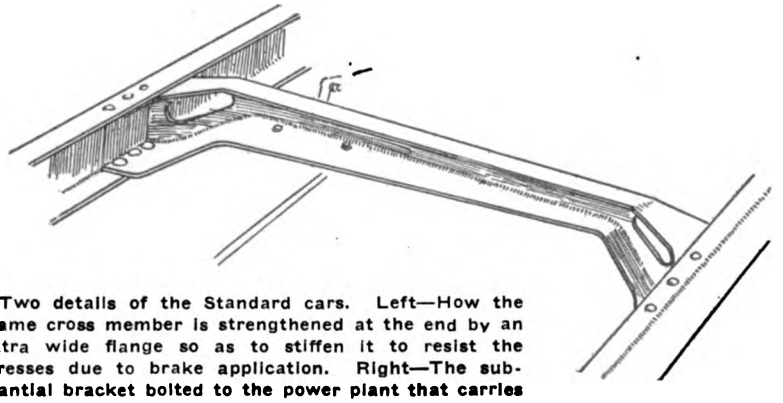
Monitor Has Low Priced Six

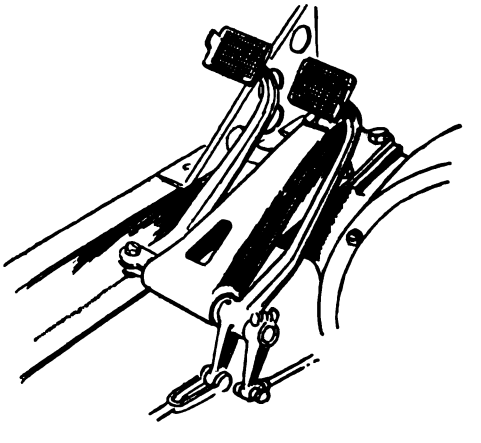
A distinctive design for both six- and four-cylinder chassis combined with low prices is the Monitor program. The engines have valves arranged F fashion, half in the head and half in the lower position and the camshafts are driven by silent chains. Both are unit powerplants with disk clutches running in oil.

To both cars five-passenger touring bodies are fitted, and on the four a roadster is supplied as an alternative at the same price.

National Twelve Is Unique

Making two sixes and a twelve, the latter is in the National case, intermediate in size, measuring by engine displacement.





Two details of the Standard cars. Left—How the frame cross member is strengthened at the end by an extra wide flange so as to stiffen it to resist the stresses due to brake application. Right—The substantial bracket bolted to the power plant that carries the clutch and brake pedals

The overall size of the twelve and the smaller six is the same, the big six having an extra 6 in. of wheelbase. New bodies of particularly handsome streamline form are being made for the big six, which is not a new chassis, and the bodies for the small six and for the twelve are modeled very much on the lines of the big six.

The twelve is the only V motor that so far has appeared with the valves arranged outside, the L-head cylinders being the reverse way round to the conventional, this making greatly for tappet accessibility and allowing the V to be used for mounting accessories. The special Splitdorf magneto is driven by silent chain and occupies the front end of the V, while the rear end is taken up by the starting motor. Only the generator and pump are outside the V these being set low down on the right side where they are accessible and yet do not interfere with the valves.

Of course, there are two camshafts these being gear driven, and the magneto and fan are driven by silent chain from one of the camshafts, this making only a short drive. Lubrication is very well worked out almost every part having a supply direct from the pump. Pistons are aluminum alloy and the speed capacity of the motor is very high indeed, 3000 r.p.m. being reached before touching the peak of the power curve. The carbureter is set in the V, using an intake manifold of the type usually associated with V motors, and internal passages then lead the gas across the cylinders to the valves.

The small six and twelve have unit powerplants, but the big six has the gearbox located amidships, and all have cone clutches. Large and extra powerful brakes are a feature of all three cars. Mention has already been made of the handsome lines of the bodies, but in addition to this, it may be remembered that the National company were among the first to adopt divided front seats. Working with this style of touring body they have produced a very convenient and comfortable design. On all the three cars cantilever springs are employed and the riding quality is noticeably above the average.

Oakland Stars Light Six

Oakland is represented this year by three models, a four, a six and an eight. The four is practically an improved continuation of the previous four, the eight and the six being entirely new. The six is a machine of the lighter type built to sell at a low price.

Whereas the four and the eight preserve the V-shaped German silver radiator and are built with very much the same shape of bodies that the cars of a year ago had, the six is an extremely light chassis with flat radiator. It is the first Oakland to use an overhead valve engine. The eight-cylinder motor is of the type in which each block of cylinders is cast integrally with half the crankcase, the latter being split vertically with the left half carrying the crankshaft. It is a standard Northway design, the six and the four also being built by that well-known motor maker.

The six-cylinder engine has dimensions of 2 13-16 by 4¾ in., and the valves are assembled on the head, which is detachable. The upper part of the crankcase is in one with the cylinders, this making a compact and substantial arrangement. To illustrate an assembly feature that is also conducive to simplicity of design, the combination of the water pump impeller, fan and fan bearings is conspicuous. The fan and water pump are really one unit, and the pump case is part in the casting of the cylinder block and part in the mounting of the fan. Thus the belt that drives the fan also works the pump, doing away with a special pump shaft and its driving mechanism.

This combination of units illustrates the pains that has been taken in all three chassis to reduce them to the utmost point of simplicity. The Hotchkiss type of drive is used on all, having been featured in Oakland design for several years now. The rear springs are made strong enough to take the drive and the torque, and the utter plainness of the chassis indicates that the engineers have accomplished what they set out to do. In the six, for instance, a plate is done away with as a mounting of the upper end of the three-quarter elliptic rear springs by slipping them into the ends of the frame channels and bolting them in place.

Oldsmobile Has Light Eight

Chassis standardization has been followed wherever possible in the 1916 Oldsmobiles, with the result that the four and the eight are very similar in construction throughout, the eight however, being stronger wherever necessary to be consistent with the greater power of the multi-cylinder engine. The former six-cylinder model has been dropped entirely.

In the four, the characteristic overhead valve engine is still used, this being of the type in which the push rods are entirely inclosed—an unusual feature where they run up the side of the cylinders. The eight is an L-head 2⅞ by 4¾, and like the four, the cylinder heads are detachable, with the crankcase split vertically into two sections, with one part integral with each block of cylinders.

The present Oldsmobile chassis is 8 in. longer than that used on the four of 1915, it now being 120 in. in length. The inclosure of the drive shaft has also been abandoned and, in keeping with the latest developments in chassis engineering, the Hotchkiss type of drive has been adopted. Naturally this makes a much lighter chassis when compared with former Oldsmobile practice, and to further lighten it, one cross member has been dispensed with without impairing the strength in any way. Due to the use of a pressed steel housing, the present axle is 48 lb. lighter than that used last year, the old form of case being malleable iron.

Thus, although the cars are more powerful than the previous types, they are much lighter, and consequently have a liveliness that is appreciated. The accelerative ability of the eight is excellent. To promote ease of riding, the rear springs have been made long and flat, they being almost horizontal when the car is in normal position. When deflected they bow to the other side of the horizontal making for more even action on the leaves.

Overland Adds Small Four

The introduction of a smaller four late in the fall has increased the Overland models to three, the others being the large four and the six.

All Overlands have the same characteristic appearance, and wherever possible they conform to one standard, although the difference in size of the cars makes necessary differences in the size and construction of parts. Up to this year, Overland motors had cylinders cast separately, but at the present time all three cars have block-cast engines. The six always did have this construction. This block casting of the cylinders of the large four car has not altered in any way the general design of the engine, simply changing the manifolding somewhat and introducing the added feature of a detachable head. In all the models the gearset is still one with the rear axle, although in the new four the design is entirely new to Overland practice. All three are equipped with magneto ignition, and have Auto-Lite starting and lighting.

It is in the new four, however, that most of the departures from former Overland practice are to be found. The design has been worked out to give a big value for the money and the underlying principles are to get as good an assembly layout as possible without sacrificing efficiency. One feature that will illustrate this is the casting of the cylinders and crankcase in one piece, and the abolition of external manifolds by coring passages within the casting leading to the valves. The cylinder head is detachable, and a more or less complicated part is done away with by the substitution of

rockers between the valve stems and cams in place of the conventional tappets. This makes a simple valve adjustment, at the same time eliminating any side thrust, and it also makes a quick assembly construction. An unusual feature is the drive of the camshaft and magneto by roller chain.

Compactness is also evident in the gearset, and to aid production and at the same time promote rigidity and consequently eliminate gear noise, the three countershaft gears are forged in one piece, it having a hollow center so as to operate on two roller bearings.

In the axle design, both front and rear, there are features heretofore unknown to Overland cars. The front axle is of the inverted Lemoine type, the wheel spindles being supported above the vertical spindle by a single arm, instead of the more conventional yoke mounting of the spindle. The rear axle is provided with a pressed steel housing, with external strengthening ribs. Springs are cantilevers in the rear of the new four, also a feature that is new to cars of this make.

Partin Palmer Makes Three Cars

Two fours and an eight make the Partin Palmer line for 1916, all three cars being very inexpensive. The eight is supplied with a neat six-passenger body, the larger four with a five passenger and the small four with a roadster.

The small four is not new, but both the others are recent additions. They have unit powerplant construction and thermo-syphon cooling, while the rear axles are fitted with double internal brakes. The eight is one of the highest geared cars now on the market having a top ratio of 3.5 to 1 with 33 by 4 in. tires.

Pathfinder Overhead Valve Twelve

Two distinct chassis, one with an overhead valve twelve and the other with a large six-cylinder motor, forms the Pathfinder output for next year. Both are entirely new cars of substantial construction and the six which is a very neat design ought not to be overlooked on account of the originality of the twelve.

The twelve has a Weidely motor with valves in the head, the single camshaft being in the usual position in the V, operating the valves by push rods and rockers. The cylinder heads are detachable, and the valves seat direct therein. The motor has a remarkably neat aspect, with the valves totally inclosed by cover plates and other covers over the push rods. Its accessibility is almost perfect, all the rocker mechanism being so put together that it is detachable by detail and with very facile adjustment for the valves.

For the six a large Continental powerplant is used, and the chassis differ in other respects also, the twelve having three-quarter rear springs and the six being fitted with cantilevers. Touring bodies and roadsters are made, including a clover leaf three passenger body which makes an ideal roadster equipment for the twelve.

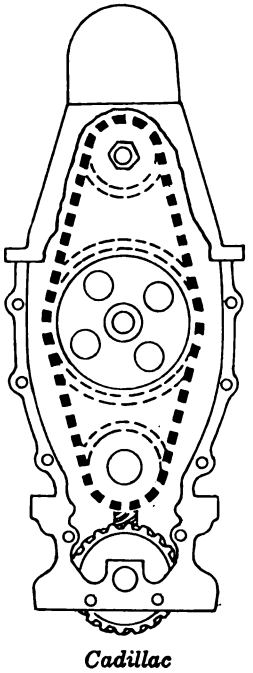
Pilot Has Three Sixes and an Eight

At the last shows the Pilot chassis was noticed particularly for its general robust proportions and for the flat cantilever springs employed, these being almost exactly the same as those used on the British Rolls-Royce. The motors were T-head with large valves, and the car eminently suited for hard work in rough country as well as smooth. For 1916 the two 1915 models will be carried on unaltered, but additionally there will be a lighter six of different layout.

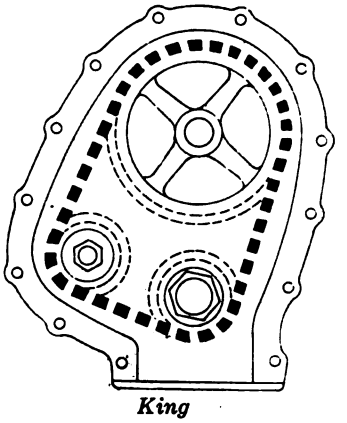
The new car has a 3 by 5-in. L-head motor and is a unit power plant design, the dry disk clutch and the gearset being in unit with the motor. It has not got the cantilever springs of the larger chassis but has semi-elliptic springs.

The Pilot eight uses the 3-in. by 5½-in. Buda motor and in other general respects resembles the larger sixes, having the cantilever rear springs. It is a 126-in. wheelbase chassis accommodating a seven-passenger body.

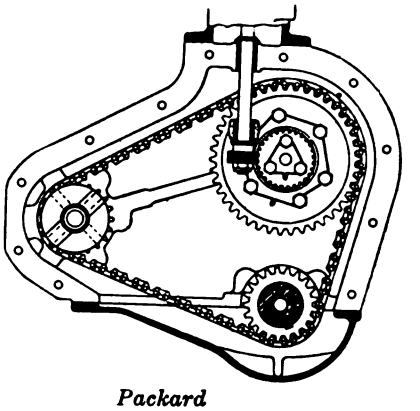
In body design the new Pilots are exponents of the double



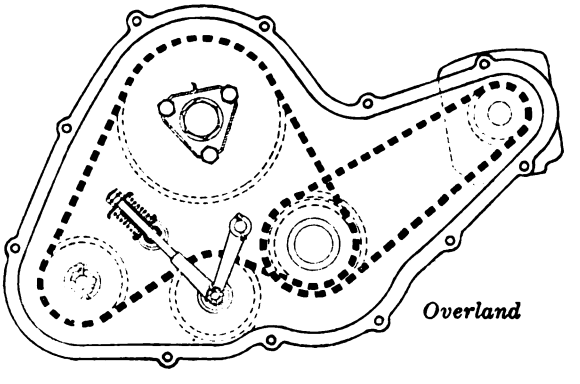
Cadillac



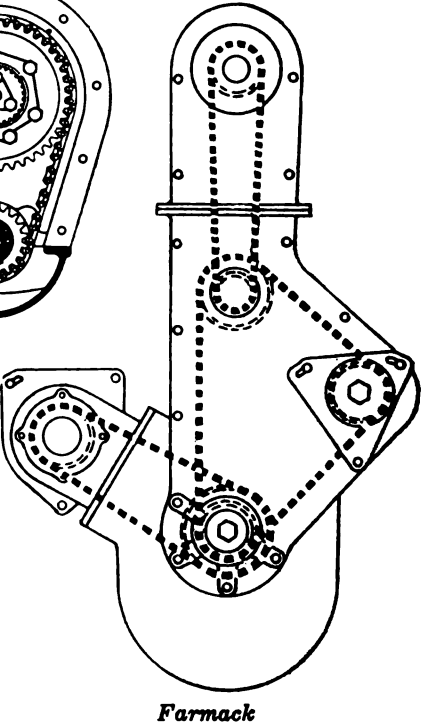
King



Packard



Overland



Farmack

Chain driving for camshafts has become much more largely used in the automobiles of 1916; the increase being 100 per cent over a year ago. Above are shown five typical layouts embodying most principles of design. The Cadillac is the simplest and is not adjustable, the Packard has an adjusting pinion on the generator shaft, this consisting of a slotted "Oldham" coupling so that turning an eccentric bushing adjusts the sprocket without affecting the generator center. The King has an idler gear on an eccentric bush, and from this idler a second chain goes to the generator shaft, which is not shown. Farmack has an elaborate layout for reaching the overhead camshaft, adjustment being provided on the triangular chain. In the Overland roller chain is used and is kept in tension by a spring loaded idler.

cowl idea, the five-passenger body having the center cowl type of streamline effect. This is obtained by bringing back the lines of the slightly oval radiator to the dash cowl, then extending the same lines, slightly broadened, to the center cowl, and so to the still more greatly widened back.

On the light six both four- and five-passenger touring bodies are obtainable, and the larger chassis have equipment for six or seven passengers if desired.

Pullman Makes Six and Four

The Pullman six is not much changed, but the four is a new model with high speed motor, disk clutch running in oil and cantilever rear springs. It is to be supplied with touring five-passenger body, with a coupé three-seated equipment or with either of two roadsters, these being for three and for two passengers.

A distinctive feature is the fitting of non-skid tires on all four wheels, the size being 31 by 4 in. Thermo-syphon cooling is employed and combined splash-pressure lubrication.

Regal Makes Eight and Two Fours

The big four Regal is a slightly altered continuation of the 1915 car, but the small four, an extremely neat little chassis, is new as is the eight. The eight motor has a unique camshaft arrangement as there is but one cam for each opposite valve pair, yet no rockers are employed.

This is done by raising the camshaft till the angle between the valves is 135 deg., and besides being simple this makes very greatly for tappet accessibility, while it is also of benefit in reducing the combustion head volume. The detachable cylinder heads are also a great advantage when removing carbon deposit or grinding the valves.

The large four and the eight both have rear axle transmissions, but the little four is a unit powerplant construction. All three cars have cantilever rear springs, and each has a Dyneto single unit lighting and starting equipment, this being accessibly disposed on the crankcase side. An alternative of five-passenger touring or of roadster bodies at the same price is given on each chassis.

Reo Improves Bodies

The four- and the six-cylinder Reo chassis have not been altered much for 1916, but have various detail refinements, notably a change in the starter drive which is simplified considerably.

In body work, however, much has been done, and the Reo six especially can be written down as one of the handsomest cars in its class. It is a molded streamline, combining the center cowl effect with the convenience of divided front seats. The top, when folded, lies perfectly horizontal and so continues the lines of the body, and the folding seats are large, with strong and rigid supports when in use.

The starting motor on Reo cars is located in a unique position, since it is operated on the front end of the main shaft of the gearbox, which is amidships. Last year the motor stood crosswise and a rather elaborate worm gear arrangement was used for the drive. This has been simplified by turning the motor round, and substituting a chain for the worm gear. It is lighter and equally effective.

For the engines the Reo company adhere to the F-head construction which they have used so long. The intake valves are in cages screwed into the head of the cylinder, and operated by push rods and rockers, while the exhaust valves lie beneath as in an L-head motor. This motor is specially interesting because of the successful way in which the overhead valve mechanism has been made quiet without inclosing the rockers. Firstly the tappets have mushroomed heads, and the washers at the foot of the valves and push rods are also provided with a large foot piece. Between the tappet and valve there is then interposed a cushion of soft material large enough in diameter to be very durable. Another point is the use of oil-absorbing felt to retain lubricant for the supply of the rocker fulcrums.

For oil supply to the principal parts of the engine there is a plunger pump which has the unique feature of being adjustable for output without a great deal of trouble.

On the six a peculiar cantilever rear spring is used, this layout having the front ends of the springs close against the frame while the rear ends on the axle are wider apart. This spreading of the springs is said to eradicate roll while leaving sufficient softness to give exceptionally good riding.

Saxon Considerably Improved

The new series Saxons cost just as much as they did before but they have a number of improvements and refinements which really make the cars strikingly good value. The little roadster is now fitted with a three-speed gearset instead of two speeds, and there is a change in the front of the cowl to bring the body up flush with the windshield and dispense with the former cloth filler skirt.

Body sides of the six, which enters its second year with very little mechanical change, are somewhat higher, this being principally due to the addition of a strip of molding around the top edge. A roadster type has also been fitted to the six chassis, and it is a graceful model, with well shaped rear deck.

In the six the chief mechanical change is the replacement of the single-unit starting and lighting system by a two-unit type, it still being made by the Detroit Starter Co. Saxon axle equipment, now made by Timken, is practically the same in design as it used to be, but a notable feature is the provision of the modern spiral-bevel axle gears as a noise-eliminating factor. The six-cylinder motor is a block type with detachable head and is quite conventional throughout; the four-cylinder engine is somewhat similar in design to the six.

On the six a nice feature is the adjustment for the chain drive of the generator, which is hung off the left rear supporting arm of the engine. A plate on the top of the generator fits into a trunnion pin attached to the supporting arm, and the generator can be rocked closer to, or away from, the engine to give the required adjustment of the sprocket centers.

In the familiar roadster, a starter and lighting unit is supplied for $50 extra, but the standard lighting has been changed by removing the acetylene lights from the sides and placing them in front, and then adding oil sidelamps. Another four refinement is the fitting of adjustable clutch and brake pedals, and added braking power has been provided by increasing the drum width from 1½ to 2 in., the diameter being 8 in.

A Saxon characteristic is the suspension of both four and six chassis on cantilevers, front and rear. The frames are also tapered to give good body support throughout the length.

Scripps-Booth Adds an Eight

About a year ago the Scripps-Booth company struck out on a new course in automobile designing and produced what it chose to term a luxurious light car. The success the concern has had during the past year has demonstrated that there is a field for such a type of car, and now it is bringing out a revised edition of this original four-cylinder model with an eight-cylinder powerplant as well as a four of similar appearance and general construction.

The new eight, with 2⅝-in. bore and 3¾-in. stroke, is said to develop over 35 hp. at 3000 r.p.m. and, while this power will perhaps not be an absolute necessity in a vehicle of this size, it is pointed out that it is designed primarily for the man who wants something out of the ordinary. The Scripps-Booth concern states that this new eight is being produced of a completeness and extreme equipment which takes it out of the price class of the four-cylinder model.

To the ordinary eye, no changes will be noted between this eight and the four, the only differences being in the strength-

ening of parts to withstand the extra power of the engine. But the four-cylinder engine is also a larger size and different in design from that heretofore used. Instead of 2⅞ by 4 cylinders, they are now 3 by 4¼, increasing the horsepower output to 21 at 1800 r.p.m., it is stated.

The general body lines that have been the subject of much favorable comment during the past year are to be continued in both the four and eight, the wheelbase of both cars remaining 110 in. Only the standard tread of 56 in. is to be supplied. Other specifications that are common to either model are the cantilever rear springs, dry-plate clutch, superseding the cone type, Bijur starting and lighting, Zenith carbureter, and three-speed gearset. The eight is to have a different design of axle from the four, and to promote silence spiral-bevel gears are fitted to it.

While both motors are cooled by thermo-syphon and battery ignition is employed, there is one radical difference, and that is in the oiling. The four uses a circulating splash system, but the eight naturally is provided with pressure feed. The crankshaft is drilled and the lubricant gets to the bearings under pressure. Aluminum is generously used in the construction of both motors.

Simplex Has New Six

The four-cylinder Simplex and the largest six are listed for next year without change, but there has been added a smaller six, though this is only small by comparison with very large cars indeed having a wheelbase of 143½ in., and a motor with 459 cu. in. displacement. All Simplex chassis are built of the highest class of materials to a conservative, but very thorough design, and are constructed with a complete disregard for cost. They are supplied for custom built bodies only and are almost custom built chassis, having a small output exclusively for a special class of customer.

In this respect the Simplex is in an almost unique position and holds a corresponding reputation for the special branch of automobile engineering which it represents.

The chassis is remarkable for its workmanship and for the quality of steel used and weight is a secondary consideration to strength, although the fine materials allow light parts to be made for many portions. The new six is a higher speed motor than the older cars, being scheduled to produce its maximum power at 2000 r.p.m.

Standard Eight and Six

Of these two cars the six is the more expensive and is a little longer in wheelbase, though much the same body equipment is fitted. The six and eight being listed with seven-passenger touring and three-passenger roadster bodies. On the six a limousine is included, but not upon the eight.

Both chassis have unit powerplants, but the six has three-quarter rear springs and a torsion tube, while the eight has semi-elliptics and Hotchkiss drive, both using dry disk clutches. Being moderately high priced cars the equipment is a special feature, and the makers are experienced in the art of body building, so the bodies are distinctly good in quality.

The main idea in laying out the chassis has been to adopt proved features and to concentrate upon the detail, thus there is nothing in the control or such small matters that has not been well worked out. The convenience of the user and of the driver has been studied so that the car can be kept in the best condition with a minimum of trouble.

Stearns Are Six, Eight or Four

Of these three cars it is only the eight that is wholly new. The light four made its appearance just a year ago, and has not been altered except by a rearrangement of the electric units, which makes for convenience. Likewise the six is to all intents the same car as last year's model. Both, of course, have Knight motors.

The eight is the first Knight-engined chassis to have a V motor, and the detail has been worked out with the greatest ingenuity. For example, there are two shafts for driving the eccentrics which operate the sleeves, as to accommodate sixteen throws on one shaft would be almost impossible. These two shafts are close together in the foot of the V just like the camshaft of a poppet valve motor, and there is a single silent chain front end. This chain drives only one of the eccentric shafts, and the second is connected to the first by a pair of spur gears. These gears are inclosed in a special chamber which is part of the crankcase and are used for the oil pump.

Battery ignition is used, this being supplied by a Remy distributer, and the cooling is by thermo-syphon circulation; the Knight motor is always easy to cool, and a V Knight especially so. The lubrication is all forced without any splash.

The gearset is in unit with the motor, inclosing a dry disk clutch and the service brake is a powerful contracting pattern located on the gearbox. An open type driveshaft is fitted and there is a torque arm, though drive passes through the cantilever rear springs. The motor has ability to revolve at a very high speed and is geared low, this giving a great high gear ability.

Standard body equipment consists of a seven-passenger touring type, of graceful outline; a modified molded form.

Studebaker Refines Design

In preparing the 1916 models for the market, the Studebaker engineers went over the chassis with two main ideas in view, one to effect standardization of the four- and six-cylinder models wherever possible so as to reduce manufacturing cost, and the other to eliminate any factors which might be conducive to noise. The bodies are practically alike on the four and the six, and most of the difference in wheelbase is taken up by the greater length of the six-cylinder engine. The wheelbases are 112 and 122 in., respectively. In fact, aside from this necessary wheelbase difference, the two chassis are practically alike except for the rear axle gear ratio and larger rear springs on the six.

One of the main changes in the cars as compared with the previous Studebakers is the redesigning of the engine for greater accessibility and quietness along with more power. Practically the same in general design, the four and the six engines both have their bore increased from 3½ to 3⅞ in., with the stroke remaining at 5 in. The cross shaft at the front which was a feature of the 1915 engine for driving pump and ignition distributer, has been entirely done away with, and the pump is now driven from the camshaft gear on the left, and the distributer is vertical and operated through bevel gear connection with the front of the camshaft. The other unit affected by the change is the generator, which now sets on end with its armature shaft vertical, and has spiral gear drive from the front gears. The starting motor is now located on the right front side of the engine, driving the crankshaft through roller chain connection.

The former bronze clutch collar has been replaced by a ball-bearing throwout, this being quieter and more durable. Whipping of the driveshaft is guarded against by enlarging the diameter from 1⅛ to 1 5-16 in., and while no changes have been made in the rear axle gearset, the axle housing is increased in size. The entire spring suspension has been gone over, and on all cars three-quarter elliptic rear springs are now used. Lower hanging of the machine is also accomplished by lowering the rear springs and dropping the front axle at the spring seats.

The bodies are very comfortable and have leather upholstery, the general finish and lines being better than in the previous year. The bonnet slopes to the cowl without a ridge between, and in the control the placing of the instruments is more convenient. A notable point here is the location of the starter pedal at the gearshift gate within easy reach.

1916 CARS IN REVIEW

IN *the pages following are illustrated the cars of* 1916, *including every typical sort of bodywork and some peculiar specimens. It will be observed that the trends so obvious a year ago have persisted, and that the smooth exterior with curves that flow unbroken from front to rear is almost universal. This is the case with closed bodies as well as open types, with roadsters as with touring cars. The* 1916 *car review displays the handsomest collection of vehicles ever gathered together.*

Four New Cars Announced

Paige, Briscoe, Haynes and Studebaker*

THE Paige Co. announces a new light six of the five-passenger form to sell at $1,050 and known as the Fleetwood Six-38 model, it replacing the Hollywood model that sold at $1,095. It is offered as a better car with greater value, despite the reduction in price. It has a larger and roomier body of more beauty of line, and is propelled by a larger, more powerful and smoother running engine than the model it supersedes, and besides these differences, it has higher quality upholstery, paint and finish.

Five inches have been added to the wheelbase, bringing it to 117 in., and the increased power is mainly attained by adding ⅛ in. to the cylinder bore, making it 3⅛ in. The stroke remains 5 in. This increased diameter boosts the N. A. C. C. rating from 21.6 to 23.5 hp., and the displacement from 212 cu. in. to 230 cu. in. The advertised horsepower is now 38, and much attention has been paid to engine balance, this also having to do with the greater power. As a step in this direction the crankshaft has been enlarged ¼ in., and it now operates on three 2-in. bearings of 2 11/16, 2¾ and 3⅛ in. length, front to rear. Much the same general design of the power plant is found, with the cylinder head detachable from the main cylinder block and the gearset in unit.

Other features of the chassis are a multiple-disk clutch, propeller shaft inclosed within a torsion tube, 44-in. cantilever rear springs, and 32 by 4 tires. In other respects, as in the general motor design, practically the same construction is used as for the previous model.

In addition to those motor changes that are conducive to more power, there are a number of smaller refinements that are worthy of attention. The forcing of oil to the main bearings and the timing gears is made more positive by a plunger pump operated by an eccentric on the camshaft, this taking the place of the formerly-used vane pump on the end of the camshaft. The main bearing caps are now held by four bolts instead of two, which makes a more substantial construction, and a point that should assist in maintaining compression is the fitting of three rings to the pistons instead of two. To aid in silencing the helical timing gears, a silk intermediate gear replaces the former iron one, so that neither gear with which it is in contact works against a metallic surface.

New Briscoe Four at $585

Following closely upon the increased facilities of the Briscoe Motor Co. as announced last week, comes the new Briscoe 24, which is the first product of the enlarged $6,000,000 corporation.

The new Briscoe has a reduction in price over the previous four, the new model selling at $585, whereas its predecessor listed at $750. The motor is 3⅛ by 5⅛ in. and the cylinders are block cast, cooling being obtained by the thermo-syphon system in connection with a honeycomb radiator. Lubrication is accomplished by the constant-level splash system. The rear axle is a floating design with gearless differential.

A two-unit system of starting and lighting is used. Regular equipment consists of a one-man waterproof top, rain-vision, clear-vision windshield, electric horn and tools. Tires are 30 by 3½ with demountable rims.

The car will be made in five-passenger touring car and two-passenger roadster models. This addition giving the Briscoe a triple line, the 4-38 at $750, and the 8-38 at $950 being continued. Production plans of the 24 call for 15,000 for 1916, while 10,000 of the other Briscoe models is the production figure set for the new year.

Haynes Adds Two Twelves

The Haynes Co. has developed a twelve-cylinder engine which will be supplied as alternative to the six-cylinder motor of the Haynes models 34 or 35. The additional cost will be about $400 and the new models will be precisely like the respective sixes in everything except the engine. The dimensions of this new motor are 2¾ by 5 in., so the stroke to bore ratio is much greater than the average.

Aluminum pistons are fitted and the lubrication system is of the full pressure variety, the motor externally being typical of Haynes design with two blocks of cylinders on an aluminum crankcase. The motor is attached to the frame at three points, which assists its interchangeability with the six-cylinder model.

The cars are very fully equipped and have wire wheels with cord tires as standard.

Studebaker Alters Prices

Changes in the nature of refinements are in evidence in the Studebakers just brought out as series 17. Although mechanically the four- and six-cylinder chassis are practically the same as they were, there is one noticeable difference in the adoption of the Stewart vacuum gasoline feed and the removal of the gasoline tank from the cowl to the rear of the chassis. Most of the refinements have come in the bodies, some of them as a result of this tank removal.

There have been some revisions of prices, too. The fours are all cheaper, the seven-passenger four-cylinder touring car being now offered at $845 instead of $885; the roadster is $25 less at $825 and the landau-roadster is $1,145 instead of $1,185. But where prices have been changed in the sixes, they have been slightly upward. The seven-passenger touring car stays at $1,050, but the six roadster is boosted from $1,000 to $1,025. The landau-roadster is the same as it was at $1,350, but the six coupe is $1,600 instead of $1,550; and the limousine has been raised $250 to $2,500. On the six chassis, a new body type has also appeared in the form of a seven-passenger sedan that sells at $1,675.

Perhaps the most attractive change in the bodies of the new touring cars in the division of the front seats into the individual type with a curved back for each passenger. Due to the shifting of the tank to the rear, the front seats have been moved forward 2¼ in., and they are provided with means of moving them forward or back 1¼ in., to meet the convenience of the occupant. The pedals have also been lengthened, providing a greater leverage. Along with these front compartment changes, the depth of the rear seating space has been increased 2 in., to give a roomier tonneau.

A little refinement that will be appreciated is the overlapping of the upper windshield glass over the lower by ⅜ in. so as to exclude wind and storm. Also due to the removal of the gasoline tank, the cowl board has been altered in design and the instruments rearranged neatly. The board is moved upward and forward to give more leg room, and as an added feature of convenience, the carbureter air control bracket is now located on the cowl board instead of the steering post.

*NOTE—The details of these cars were received too late for inclusion in our classified descriptions or in the specification tables.

1916 Passenger Automobiles Listed

Listing 108 Makes of Cars and 176 Chassis Models—Full Details of Power Plant Seventy-Eight Sixes, Twenty-

FOLLOWING its annual custom, THE AUTOMOBILE publishes herewith its table of specications to serve as a reference for the 1916 models. The information from which these tables are derived is authentic data furnished by the manufacturers themselves upon specification sheets especially adapted for the purpose. These sheets are filled out and signed by a member of the concern making the car, thereby rendering the information supplied accurate and as complete as possible. There are a few makers whose names do not appear in the list and where this occurs it is because the 1916 models have not as yet been announced and will not be until after the opening of the New York Show. In other instances models are announced in these tabulations for the first time.

Include 108 Makes

In addition to the information given in the tabulations a review of the field is given in the descriptions published on pages 1185 to 1212 of this issue, and for those to whom the price is of particular importance a buyer's guide will be found with cars listed under price classifications on pages 1213 to 1244. This other information, together with the complete data furnished in the specification tables herewith, offers an excellent opportunity to not only observe the trends of the industry and its individual design, but also for the intended purchaser offers a far better opportunity for investigation than would be secured in a week's visit along the showrooms of the automobile row of a large city.

Tabulations on this and succeeding pages include the names of 108 different manufacturers and a total of 176 different chassis models. These are listed alphabetically, and in every case are the models that the manufacturers named are placing on the market for the 1916 season. The use to which these tables are put depends entirely upon the purpose of the reader. For the purchaser, the better way would be to first turn to the price classification and select the name of the manufacturer making models at the price desired. After the names and models have been noted, the specification tables should be turned to and here, at a glance, the intending purchaser can make whatever comparisons he desires and see which car is most closely adapted to his needs.

In going over the mechanical specifications of a car the nature of the work that the car is intended to do must be taken into careful consideration. Naturally, for a hilly, arduous country, the intending purchaser looks for a car with plenty of reserve power and a gear ratio which will enable him to meet the difficulties of the country. On the other hand, a car which is intended to be used over the level surfaces of the city streets may not require the weight and power of the car intended for the rougher countries, but on the other hand should show the factors of economy and comfort.

The arrangement of the tables follow through the chassis in logical order. The power plant is first considered, and under this broad head the number of cylinders, the bore and stroke dimensions, horsepower, displacement, cylinder shape, make of motor, details of the valve location, camshaft drive, cooling, lubrication, ignition, carburetion and electrical equipment are furnished.

with Their Technical Specifications

Transmission System and Running Gear of Seventy-Three Models of Fours, Three Eights and Four Twelves

In giving the bore and stroke of the motor the fractions of an inch are supplied in decimals carried accurately to three places. Since practically all the manufacturers in this country have motors with dimensions which do not run to smaller fractions than eighths of an inch, this decimal system gives the measurements with absolute accuracy.

Supply Formula Horsepower

Under the head, Society of Automobile Engineers Horsepower, denoted in the table as S. A. E. H. P., the formula horsepower is supplied. This is the figure arrived at by the use of the formula which has become generally accepted by insurance rating concerns and by state and municipal authorities. The formula is the bore squared times the number of cylinders divided by 2.5. Thus, a six-cylinder motor with 3 by 5 cylinders would have its horsepower calculated by formula by carrying out the operation of multiplying 3 by 3 by 6 and dividing by 2.5, giving a rating of 21.60 horsepower. This figure must be regarded as separate and distinct from the brake horsepower, which depends altogether upon the individual characteristics of the motor and which, therefore, cannot be estimated but must be determined by actual tests. Since test figures are not available, no attempt has been made to publish brake horsepower.

In order to complete the information given by the formula horsepower, which in the modern design is practically certain to be below the maximum output, the piston displacement also is furnished. This gives an accurate clue to the capacity of the motors and, in fact, is probably more of a guide to expected output than the formula.

Supplemental Late Information

Information arriving too late to be put in the alphabetical tabulation below is given herewith. Other new cars, of which detailed specifications are not available, are described on page 1245.

Chalmers Light Six

Chalmers Light Six, No. of Cylinders, 6; Bore and Stroke, 3.250 by 4.500; S. A. E. H.P., 25.4; Piston Displacement, 224; Shape, I; Cast, 6; Valve Location, Head; Camshaft Drive, Hel'l; Lubricating System, Splash-Pressure; Ignition, Single; Remy; Carbureter, Stromberg; Electric Lighting and Starting, Westinghouse; Clutch, Disk; Gearset, Three-speed; Selective, Unit M; Axle, Timken Semi-floating; Gear Ratio, 4.75 to 1; Wheelbase, 115 In.; Tires, 32 by 4; Rear Springs, Semi-elliptic; Steeling Wheel, Left; Control, Center; Crankshaft Bearing, Plain, 3; Anti-friction Bearings, Gearset Bearings, Roller; Rear Axle Bearings, Roller; Front Wheel Bearings, Roller.

Pilot 8-55

Pilot 8-55; No. of Cylinders, 8; Bore and Stroke, 3.000 by 5.125; S. A. E. H.P., 28.80; Piston Displacement, 289.8; Cylinder Shape, V; Cast, 4; Valve Location, Inside; Camshaft Drive, Hel'l; Cooling, Thermo; Lubrication, Pressure; Oil Pump, Gear; Ignition, Single, Westinghouse; Hand and Automatic Control, Starting and Lighting, Westinghouse; Clutch, Disk; Gearset, Selective, Unit M; Three-Speeds; Spiral Bevel Drive; Drive Through Springs; Axle, Floating, Hess; Gear Ratio, 4 to 1; Wheelbase, 126; Tires, 34 by 4; Spring Cantilever; Left Drive, Center Control; Crankshaft Bearing; Plain 3; Gearset Bearings, Ball; Rear Axle Bearings, Ball; Front Wheel Bearings, Roller.

Hollier Eight

Hollier Eight, No. of Cylinders, 8; Bore and Stroke, 3 by 4¼; S. A. E. H.P., 28.80; Piston Displacement, 240.3; Shape, V; Cast, 4's; Valve Location, inside; Camshaft Drive, Hel'l; Lubricating System, Pressure; Oil Pump, Gear; Ignition, Single, At. Kent, Atmtc. Control; Carbureter, Stewart; Electric Starting and Lighting, Apelco; Clutch, Cone; Gearset, Selective, Amidships, Three-Speed; Final Drive, Bevel; Gear Ratio, 4 to 1; Wheelbase, 112; Tires, 32 x 3½; Wheels, Wood; Rear Springs, Cantilever; Steering Wheel, Left; Control, Center; Crankshaft Bearings, Plain, 3; Anti-Friction Bearing, Gearset, Ball; Rear Axle, B. & R.

Lexington 6-0

Lexington 6-0, No. of Cylinders, 6; Bore and Stroke, 3.250 by 4.500; S. A. E. H.P., 25.35; Piston Displacement, 224.0; How Cast, 6; Cooling Circulation, Pump; Lubrication, Splash Pressure; Ignition, Single; Electric Starting and Lighting, Westinghouse; Fuel Feed, Vacuum; Clutch, Disk; Gearset Type, Selective; Location, Unit M; Number of Speeds, Three; Drive, Spiral Bevel; Drive Through, Springs; Rear Axle, Floating; Make, Hess; Wheelbase, 116; Tires, 32 by 4; Steering Location, Left; Levers, Center.

H A L Twelve

H A L Twelve, Motor, Twelve-Cylinder; Bore and Stroke, 2.875 by 5.000; S. A. E. H.P., 39.68; Piston Displacement, 389.5; Wheel base, 135 in.; Tires, 34 by 4½.

ABBREVIATIONS:—Cylinder Shape: L-Head, L; T-Head, T. Make of Motor: Herschell-Spillman, Hersch-Spill; Rutenber & Beaver, Rut.&Beav.; Golden, Belknap & Swartz, G.B.&S. Valve Location: Between V, Inside; Opposite, Opp; Left and Head, L&Hd; Knight, Kni. Camshaft Drive: Helical, Hel'l; Spur Gears, Spur. Cooling Circulation: Thermo Syphon, T; Pump, P. Lubrication System: Splash Pressure, Splash-Pres. Ignition Make: Westinghouse, Westhse; Connecticut, Conn; Atwater Kent, At Kent. Ignition Control: Hand and Automatic, H&A; Automatic, Atmtc. Make of Carbureter: Stromberg, Strombrg.
Remy also supplied.

THE ENGINEERING SIGNIFICANCE OF AMERICAN RACING SUCCESSES; THE FRENCH AND THE AMERICAN VIEWPOINTS—BALANCE OF EIGHTS—ROTARY ENGINES

Old European vs. New American Racing Cars

By Louis Delage,
L. Delage & Cie, Courbevoie, France

EDITOR THE AUTOMOBILE:—In your issue of Oct. 14 you publish an article entitled America's Engineering Triumph, with a sub-title reading Europe's Finest Cars Completely Vanquished by the Product of American Engineering Skill.

Will you allow me, sir, as the builder of one of these cars, to make a few reflections? Can you in all truthfulness say that you have defeated the finest European cars? Do you think it is really just to compare cars designed and built during the present year with racing cars constructed two and a half years ago? Since that time, it must be admitted, you in America have worked hard at the problems of efficiency of motors and automobile mechanism, while we have been able to do nothing? English, French and German automobile manufacturers, against whom your own manufacturers have just competed, have, unfortunately, had another and more important task on hand.

Europe Originated Ideas

Again, you state that this rout of European cars has been brought about by the genius of American ideas. Here again, sir, I must ask you if you can honestly uphold such a claim? This letter has not been written with any idea of belittling the winning American cars. But accompanying this article are two mechanical drawings of the winning motor. These drawings show that this wonderful motor possesses the Peugeot crankshaft built up in two parts according to the Delage method. The lubrication system is that of the Delage cars. The camshaft drive is Peugeot type. The combustion chamber, the valves, and the camshaft are Mercedes. The connecting-rods and pistons and their method of attachment are Peugeot and Sunbeam. The general characteristics of the motor, the bore and stroke, are Sunbeam, Peugeot and Delage, these same characteristics having also been adopted by Mercedes in the last French grand prix. In view of this, can you in all honesty make very serious claims in favor of American mechanical skill?

Admires Stutz Performance

I must again repeat that I do not wish by this letter to deny the incontestable value of the Stutz cars, nor do I wish to belittle the splendid results obtained by Stutz in this race. But I do believe that you Americans are better sportsmen than to seek to compare your new cars with our old ones, and to give to your new cars more merit than they really possess.

Some day circumstances will allow us to line up by the side of American cars with racing machines designed and built at the same time as your own; we shall compete with our own drivers and our own mechanicians; we shall have our own workshops established by the side of the track, with everything that our men may need to put their cars into the best possible racing condition. If you win then, but not until then, you can claim to have completely vanquished Europe's finest cars.

I hope that day may come soon. It will give me the greatest personal pleasure to compete against your national champions, as we did so successfully at Indianapolis two years ago.

Engineering Is Evolution—Not Revolution

By Harry Stutz,
President Stutz Motor Car Co.

EDITOR THE AUTOMOBILE:—There has been a tendency in some quarters to contend that much of the engineering in the Stutz is of foreign origin. Especially is this tendency shown since the American car showed its heels to the fastest cars racing in 300 cu. in. class Europe has ever produced. The demonstration took place on the lightning-fast Sheepshead bay course and it was the most pronounced demonstration of superior quality that any car ever made in a competitive test—the Stutz winning both first and second. European automobile trade journals and a very few American publications have tried to show that the Stutz cars were very similar to the foreign cars. But for that matter, so are all very fast cars, because the principles of engineering which are employed in making fast cars are universal and almost standard. To deny the fundamentals of fast construction would be suicidal on the part of any maker who seriously contemplates making a showing against the world's fastest cars.

American Stamina Won

At the same time it must be remembered that one of the things which won for Stutz was stamina. Speed was present but it was American stamina which tipped the scales the right way and brought an American car home the winner.

It would be ridiculous for an American writer to violate the precepts of good composition set down by Milton, Macaulay and Shakespeare. No American painter would violate the laws of drawing evolved by the world's great masters. American writers and painters may some day do for art what the Stutz did for racing, namely, bring the championship to our side of the Atlantic, but if they do they will not accomplish this end by working along new and revolutionary lines. Engineering, as well as art, is an evolution, not a revolution. That which is good is clung to—that which proves wrong is eliminated by time. If America had failed to recognize this fact a European car would at this moment be the world's champion instead of an American.

Europe has not hesitated to adopt everything American that has looked good to it. They have adopted our submarines, our telephones, our aeroplanes, our smokeless pow-

der and a thousand and one other things that we have done better than they. If we in turn find something that they have contributed to the world's sum total of knowledge why should we deny ourselves the benefit of it? The trick comes in adapting European ideals to our conditions. And don't forget that there were as many Americanisms in the two Stutz cars that captured first and second place in the big Sheepshead Bay Race as there were Europeanisms. And the most important Americanism was stamina.

V Motors and Vibration

By Arthur A. Bull

Assistant Chief Engineer Cole Motor Car Co.

EDITOR THE AUTOMOBILE:—In the issue of THE AUTOMOBILE for Nov. 11, Allen Loomis calls attention to what he considers an obvious error in the computation of unit inertia pressure and takes exception to the figures given in the paper. The figures given are, however, substantially correct, as the following comments will tend to show.

First, Mr. Loomis states that "the total inertia forces acting upon each crankpin of the Cole motor are due to the inertia of the reciprocating masses of two cylinders," presumably by reason of opposite cylinders having their pistons attached to a common bearing.

Fundamentally this statement is correct; however, the net resultant of the forces of both piston masses is not by any means the addition of the forces of both piston masses as the statement would infer.

On the contrary, the maximum resultant force on the crankpin is substantially the same as the maximum inertia of *one* piston mass only.

Twin Bearings Advantageous

Unconsciously, therefore, Mr. Loomis, in his assertion, substantiates one of the virtues of the twin bearing as used in the Cole eight, because, while the bearing is double that which would be used with side by side rods, the resultant inertia force is practically no more than that due to one piston mass.

The maximum condition exists when one piston is at the top of its stroke.

The inertia will be at a maximum in this cylinder.

The opposite piston is attached to the same crankpin and will be just past mid position, having a small accelerating force acting on the crankpin in the line of the connecting-rod.

Plotting the magnitude and direction of these two component forces graphically, the resultant force and its direction are found, it being about 5 lb. above the larger component.

In the same paragraph Mr. Loomis says, "The *inertia* forces will be plus the revolving weight of the connecting-rod big ends."

The bearing loads set up by the revolving masses of the connecting-rod big ends is usually considered as being due to the "centrifugal force" of the masses rather than inertia, and was for this reason not included. Since this was evidently included in the twin six figure for inertia pressures, to make the comparison fair, the following correction is added: Unit pressure due to inertia of reciprocating parts and centrifugal force of big ends in Cole eight—452 lb.

Referring to the criticism regarding the calculation of the horizontal vibratory force:

Let it first be emphasized that the diagrams, Figs. 4 and 5, referred to by Mr. Loomis and which he claims to have modified, represented the "unbalanced forces of the piston masses in each block," and were referred to as such in the paper, page 14, while the title added to the diagrams themselves indicated this also.

Since the resultant curve in Figs. 4 and 5 was that of two masses, the total resultant would be twice that magnitude; hence Mr. Crawford's correction.

However, these diagrams and those indicated at Figs. 9 and 10 were primarily intended to picture graphically the inertia forces at the distinctive speeds of rotation, to show the actual piston inertia of each piston and its load on the crankpin at different angularities and also to show how the inertia forces cancelled out with a crankshaft with the pins set at 90 deg.

Illustration, Fig. 8, was also added to show how a "balanced system" was possible in the "V-type eight" eliminating the vibratory force alluded to, correcting the statement that the V eight must of necessity be an unbalanced system.

In the light of the arguments, founded by research, given in Mr. Crawford's paper, and the possibilities of developments, the one (apparent) disadvantage argued against the eight V principle, that is, the vibratory tendency, seems to have a weak foundation, ignoring the successful performance of the eight to date.

Unbalanced Force Unimportant

To one who has read the paper thoroughly, it will be observed that the point which was intended to be brought out prominently was that "the theoretically unbalanced forces did not offer such objectional vibrations as do the vibrations arising from other sources, such as elastic yielding of the parts, and unevenness in cylinder work to which the twin six would be more prone than the "V eight" of equal capacity.

So far as the actual magnitude of the horizontal vibratory force, this is admittedly 1.43 times that of the force in the block, or 1.43 times greater than the unbalanced forces of a four-cylinder engine of one-half the capacity of the eight.

If, however, it is considered in another way, the vibratory force of the eight would only be 7/10 that of a four of equal capacity.

Referring to the remark wherein Mr. Loomis says, "The vibratory effect cannot be ignored either when one considers theoretically but properly that this force *acts upon only one end of only the unsprung weight of the car.*"

This is not quite clear—is it assumed that the vibratory effect will be more pronounced in the tonneau by reason of the application of the force at the end of the chassis remote therefrom?

The contrary would appear the more logical!

Would it not be reasonable to assume that the vibratory force, which is in nature similar to an externally applied force, has an effect similar to the smaller vibrations imparted to the car by road shocks?

Revolving Motor Is Suggested Term

By Fred C. Booth

EDITOR THE AUTOMOBILE:—Anent Edward V. Hartford's timely discussion of gnome and rotary motors, I suggest use of the word Revolving as applicable to motors of the French gnome and American gyro types only.

These motors revolve in every part but the crankshaft, the pistons having a simultaneous reciprocal and revolving motion. All others, however, revolve the crankshaft only. Hence, types of aviation motors may be accurately divided into three classes, gnome or revolving type, star type, having a radial arrangement of the cylinders, but with cylinders and crankcase fixed, and car type, of four, six, eight or twelve cylinders, vertical or V arrangement.

Incidentally, the true rotary engine is a thing of the future. I expect to see it replace even our present smooth eights and twelves, just as surely as the steam rotary engine or turbine is replacing the reciprocating type.

The Rostrum

Compression Varies Widely in Stock Cars

EDITOR THE AUTOMOBILE:—What is the average cold air compression in automobile engines? I have heard much about high-compression engines of late and I would like to find out just what is meant. The other day I received a booklet describing a popular eight in which a Northway motor is used, the compression being given as 60 lb. per sq. in. and it was spoken of as being rather high. Four or five years ago when big, slow-speed, low compression motors were the rule, I understood that 60 lb. was considered as about the average. By 60 lb. compression I mean gage, not absolute.

Or, to put it a little more specifically, what compression is used in the following motors, or as many of them as you can give without too much trouble: Mercer 22-72; Packard twin-six, Cadillac eight, Studebaker, Pierce and Stearns? Also how high does the compression (cold air), run in some of the racers that fared forth at Sheepshead Bay in the Astor Cup Race?

Worcester, Mass. F. B. F.

—Compression varies all the way from 40 to 80 lb. per sq. in. absolute, all depending on the ideas of the engineer to design the motor and the purposes for which it is intended.

To give you definite figures as you ask is not possible in all cases as some manufacturers object to the publication of this information. The compression in the Packard Twin-Six is approximately 75 lb. with the throttle wide open and at a motor speed of 110 to 120 r.p.m. This pressure while somewhat higher than the average is made possible by the small bore of the motor which is only 3 in. On the Packard 4½-in. motor, the compression has been 60 lb. and the 5-in. bore motors, 55 lb.

The Pierce-Arrow compression space varies from 26.6 to 29 per cent of the cylinder displacement in the 38, 48 and 66 cars. The highest compression is used in the 38.

On the Stearns the compression space is one-fifth of the total cylinder volume. The compression in the Cadillac eight is 86 lb. at 1000 r.p.m., with a wide open throttle. The Studebaker has a compression of from 60 to 65 lb. gage at about 100 r.p.m. This amounts to about 70 lb. per sq. in.

In racing cars the compression reaches 100 lb. per sq. in.

Forty Cu. In. Tank Is Necessary

Editor THE AUTOMOBILE:—How small a tank could be used that could be made to hold sufficient carbide gas to last one ¼-ft. burner 15 hr. If a circular tank was used what could be its smallest possible dimensions? How much carbide could be used?

If all the gas in the carbide was stored in the tank without loss, would the outlay for a small plant to charge tanks of this kind be great? Could it be done at all? What in your opinion would the cost of manufacturing such tanks be?

Indiana, Pa. J. W.

—The tube for containing the quantity of gas desired in this instance must have 40 cu. in. water capacity. The diameter and length can be made as desired to give this capacity. The interior of the cylinder must be constructed along the lines laid down in the regulations of the Inter-State Commerce Commission, Shipping Container Specifications No. 8 in that they must be completely filled with a porous substance saturated with acitone or other approved solvents and must not be filled to exceed a pressure of 250 lb. to the square inch.

Regarding the second paragraph of your letter, high pressure generators used for generating and of their own pressure charging these cylinders, are not only unsafe but positively dangerous. Within the past several years a great many of very disastrous accidents have happened, therefore, the gas should be generated in low-pressure generators and pumped into the cylinders using compressors of at least two stages.

The cost of such a plant will be considerable and the cost of manufacturing the special size cylinders, unless they are used in very large quantities, would make the expense of the operation out of all proportions to the benefit to be derived from the use of such a container.

The Prest-O-Lite company now markets a container 4 in. in diameter by 10 in. in overall length which contains 10 cu. ft. of gas and would carry a ¼-ft. burner for 40 hr. This however, is the smallest cylinder that this concern believes it possible to produce and handle commercially, having spent considerable time and money experimenting with smaller sized cylinders for special portable purposes.

Rebuilding Hupmobile 20 of 1909

Editor THE AUTOMOBILE:—I have a 1909 model 20 Hupmobile which I am contemplating cutting down for a raceabout. Can I lower the steering wheel?

2—Please give me the timing on this car to give the best results. Any other suggestions would be greatly appreciated.

Athens, Tenn. C. C. H.

—Any good mechanic should be able to do this work for you, although THE AUTOMOBILE has no record of it having been done. The steering gear on this car is a rack and pinion design and would not seem to present any particular difficulty.

2—The timing on this car is given in the diagram on the next page.

Steering Connections of Cadillac 1915

Editor THE AUTOMOBILE:—Will you kindly let me know if this would be right for the firing order of an eight-cylinder motors: 1, 8, 3, 6, 4, 5, 2, 7?

2—Under or connected at the end of the steering rod housing is some attachment which operates when the spark or gas lever is operated—meaning spark and gas lever at driving wheel sector. Will you kindly explain its duties? Cadillac 1915 late model.

3—How would you test for a grounded interrupter point?

4—How should one test for switch trouble? Not a starting switch.

5—Will you kindly explain the reason for light on a Ford getting dim when the car takes a hill?

6—Explain the timing of a Bijur motor generator distributer.

7—Kindly explain the type of push rods used on a Cadillac eight 1915 model? How are they adjusted?

Jersey City, N. J. E. W. C.

—The cylinders may be made to fire in that order although it is more customary to have them firing across the block.

2—The steering shaft on the type 51 Cadillac is hollow and a tube and rod run through the center. The spark lever above the steering wheel is connected to the upper end of the rod. The throttle lever above the steering wheel is connected to the upper end of the tube. Small segments of bevel gears are attached to the lower ends of the tube and rod. Other segments of bevel gears mesh with the segments attached to the spark rods and throttle tube. Rods running from these segments operate the spark advance and the throttle in the carbureter.

3—A flow of current through the primary when the breaker points are separated, should give a clue to this. This can be detected by an ammeter on the ignition line when the points are separated.

4—Disconnect the wires from the switch and close the circuits by touching the wires together. If the circuit operates correctly at that time, but incorrectly by the switch, it will indicate that something is wrong with the latter.

5—The current output of the Ford magneto generator rises in proportion to the speed of motor. Consequently when the motor slows down on a hill the generator output becomes less and the lights grow dim.

6—The Bijur Motor Lighting Co., does not make any motor generators with distributers.

7—The valve tappets on the eight-cylinder Cadillac are operated by rocker arms. The upper end of each valve tappet is drilled and tapped and an adjustment screw fitted with a lock nut. The adjustment is made by loosening the lock nut and screwing the adjustment screw in or out as required. After this, it is locked with the adjustment nut.

Effect of Metering Pin Shape

Editor THE AUTOMOBILE:—Will you describe the effects of the following conditions through the Rostrum Dept.? Having the needle valve jet point in say any carbureter ground at a very acute angle and also having it ground at a more obtuse angle what will be the effect of such seats, at both low and high engine speeds in each case; considering its adjustment to be common for all speeds, such as used in the Kingston carbureter. The case I have in mind is a Kingston and seems to load when the engine is pulling extremely hard; hence, low speed. Would a change in the jet point L effect this? Also, explain the effect of different levels low and high, not above jet, of float in connection with this?

Pratt, Kans. R. P.

—The difference in the grinding of the needle valve will not have any effect on the carbureter in which the position of the needle valve remains constant, because if the area of the opening is correct, that is all that is necessary. If on the other hand, the needle valve acts as a metering pin, and is raised and lowered to give compensation for different speeds, the angle will have a very material difference, since it will effect the area of the opening differently for each angle.

The effect of different levels is simply that a higher level will give a richer mixture at the jet and a lower level will give the leaner mixture for the same needle valve opening.

R.P.M. of 1910 Elmore

Editor THE AUTOMOBILE:—I would like to know at what revolutions per minute or piston speed the 1910 Elmore engine developed its maximum power. This engine is of the three-port two-cycle type with ordinary crankcase compression. The mixture is transferred from the crankcase to cylinder through the ordinary form of by-pass and not by means of distributing valves. The later models used the distributing valves.

This motor has four cylinders, and a bore of 4½ and stroke of 4-in.

Ithaca, N. Y. H. C. D., JR.

—The revolutions per minute of the Elmore 1910 engine are 800 to 1300.

It is of course understood that the r.p.m. of a motor will vary with each change in its condition as regards carbonization, etc.

Equipment of Model 17 Buick

Editor THE AUTOMOBILE:—I have a 1910 Buick model 17 and would like to know what the original equipment was, as to ignition, carburetion and water systems. I also would like to know the bore, stroke and rating of this engine and will greatly appreciate your advice in the matter.

N. Y. City. W. J. R.

—Model 17 Buick was a four-cylinder motor with a 4½ bore and 5-in. stroke. These motors have been able to develop up to 50 hp. at 1200 r.p.m. on the block. They were equipped with Schebler carbureter, Remy magnetos and pump circulating cooling system with gear pumps and tubular radiators.

Franklin Uses Less Oil than Record

Editor THE AUTOMOBILE:—I read with much interest the article in THE AUTOMOBILE entitled, Franklin Travels 1046 miles on 1 gal. of Oil. As I have been driving a Franklin 6-30 roadster for the past seventeen months and the oil consumption has been much less than that record during the whole period, provided you do not consider the oil needed to refill the reservoir after drawing out and cleaning the crankcase. I have driven the car over 10,000 miles and it has never required more than 1 qt. of oil to maintain the level in the reservoir for 800 miles.

It takes 6½ qt. to refill the reservoir, and I clean out and renew the supply every 1500 miles, and during the run of 1500 miles it is unnecessary to add more than 3 pt. to 2 qt. to maintain the level. I am using Quaker State oil, the same as the car used in the above mentioned test, but I have always used Oildag mixed with it. I might add the facts that the engine has never had a bearing adjusted or a valve ground yet and runs as smoothly as when new.

Brattleboro, Vt. C. A. S.

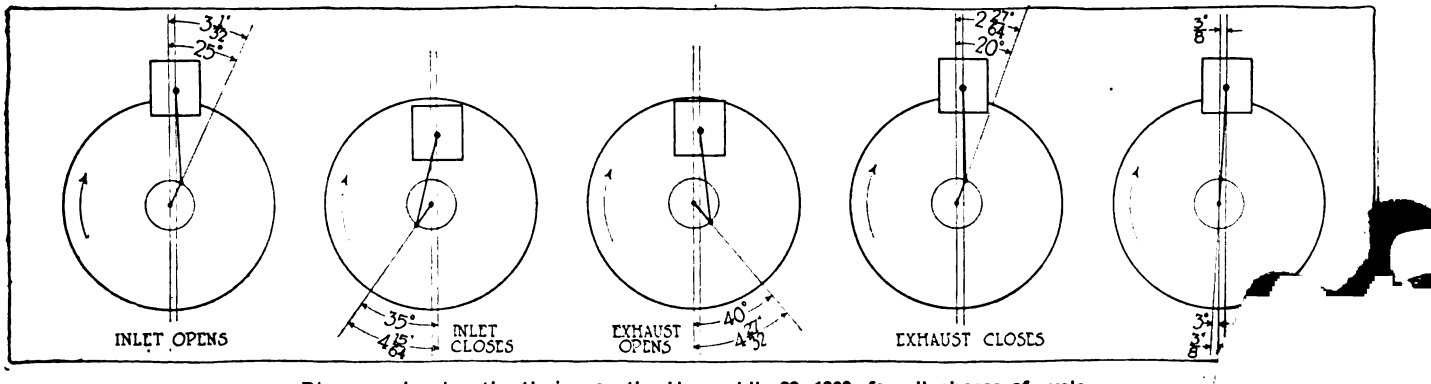

Diagram showing the timing on the Hupmobile 20, 1909, for all phases of cycle

Consolidation Vs. Speculation

BIG combines and great mergers may spell prosperity or ruin, according to whether they commercially are reasonable or not. Combinations between companies which are brought about by the desire for better trading in the future and the consequent better profits that may be expected to accrue are usually good. Combinations that are made with the idea of immediate profits on the deal in stocks are usually bad. To make a human analogy a man builds a better house if he means to live in it than he will erect as a speculation in the hope of a quick sale. The man who builds his house and makes his home in it is the more useful citizen of the country. The business chief who makes his business and lives in it is the better citizen of his industry.

Countries and industries alike depend for their reputation, and for the well being of those who are identified with them in humble capacity, upon the integrity and common sense of their government. Industries rank with each other much as nations, and the industry that loses the respect and trust of its world is in as bad a case as a nation that is placed similarly.

In an incredibly short space of time the automobile industry has built itself a great place in the commercial divisions of the world's business. It is now the task of all in that industry to see the reputation so easily gained is maintained no less ably.

Meeting the Price

EMPHATICALLY the most remarkable thing about the 1916 automobile is its price; its unexpected cheapness. No living man can say whether we are enjoying a false drop which will prove in the future to have been ill conceived, or whether we are but half way down on the fall. Whether the average price of the 1917 automobile is to show a continued drop, or whether it will show a rise, is a matter purely of speculation. Yet, whatever the future has in store the fact remains that the automobile of 1916 is the best and cheapest the world has ever seen.

There are better cars to be had for $1,000 to-day than were purchasable two years ago for double the money. This means that the buyer is going to get much more than double the amount of return for the money expended, he is gaining 50 per cent on the price and gaining an indefinite amount in addition because of the better engineering in his car.

Fours Preponderate

DESPITE all averages deduced from listed models of cars, it must not be forgotten that there have been made vastly more four-cylinder automobiles than all other types added together. Next year the *majority* of the cars built will have four cylinders, some say 75 per cent of the 1916 cars produced in America will have this number of cylinders. The reason can be only that four-cylinder construction is the cheapest that will give reasonable satisfaction.

As cheaper models of sixes and eights are placed on the market, and as the manufacturers thereof increase their production, the proportional preponderance of fours may be decreasing, but the very great increases of output are to be sought rather among the four-cylinder specialists than in other fields.

Noise the Quarry

TRACING the development of the automobile it is easy to observe waves of activity in definite directions and in successive periods, and making such an examination reveals the suggestion that the noisiest part of the chassis has generally been the first to obtain the concentrated attention of engineers.

After the first struggles had resulted in the production of a machine that had some modicum of reliability, the first feature of it to be altered was the chain drive. The chain drive was reliable and fairly efficient and it gave very little trouble, but it did certainly create considerable noise as the chains became worn, hence, the big change of the next year or two, was from chain transmission to the live axle and bevel drive.

Another noisy part of the chassis was the gearbox, and this was attacked at a slightly later, but slightly overlapping period, with the result that the direct drive on high gear was evolved.

Having thus more or less disposed of the trans-

mission, the noise of the motor became paramount, and we saw inclosed valves, sleeve valves, chain front ends, smaller cylinders and more of them; and so forth. Two years ago the motor had been silenced to a point where the transmission became noisy again by comparison and thence sprang the worm drive activity, which culminated in the discovery of easy means for making the spiral bevel.

To-day noise is conquered, or almost so; motor, gearset and smaller parts operate almost noiselessly and engineers have had time for other things, such as high gear ability. Signs are not wanting that this, too, is almost subdued to the will of the engineer, leaving the way open for the next achievement, which seems likely to be that of weight reduction.

Body Development

FEW things are more remarkable in the progress of the past 2 years than the development of bodies. The car bodies of 1916 are much more handsome in appearance and much more comfortable internally than were those of 1914, and they are costing less to make. It is largely another instance of the efficiency of simplicity.

Emphatically 1915 has been a year of large bodies, big seven-passenger equipment being put on quite low-priced chassis, and in looking down the list of body options given by the leading makers it is easy to see the reaction, in the shape of many three-seated roadsters, clover leaf four-passenger cars and the variants thereof.

The close-coupled tonneau body is coming back in a new form, and apparently is finding much favor with motorists. Seeing that it was practically a new thing a year ago, the number of the clover leaf style of body now in use is a striking tribute to the qualities of this design and everything points to a much greater output of this equipment during 1916.

Cantilevers Spreading

AS the arguments for and against cantilever springs have died away, with very little conclusion reached on academic points, it is noteworthy that the use of the cantilever spring has increased considerably. There is no hidden mystery within the cantilever form of suspension, it can give good or bad results just as can any other type, but in practice the spring designers have been most successful in choosing cantilever proportions.

The cantilever spring has proved itself a worthy part of a chassis. Stripped of any glamor it remains an excellent form of spring, specially suitable for certain applications and less desirable for others. It provides the automobile engineer with an additional form of great adaptability as an alternative to other types, and its convenience is likely to lead to a still greater extension of its field. In body development another thing of probable importance is the spreading popularity of the detachable top which enables a touring body to be converted into a fully closed type. This style is at present in an early stage of development and is full of promise for the future, the manufacturers who have adopted it finding a growing demand and great appreciation of the convenience. Some expect this to lead to a wider use of closed bodies, and others fancy the body with a permanent roof and removable windows, but meanwhile the upper structure which is detachable as a unit is being turned out in thousands.

Simplification

READING through the analysis of trends of design as shown by the 1916 chassis it is very noticeable that almost every development of the past year has been towards simplification of some part or other. The only thing in which complexity has apparently been increased is the motor, but this is not really the case either. The V engine, eight or twelve-cylinder, has more simple parts like pistons and cylinders, but it has usually fewer intricate small pieces than the average six of a year or two ago. Sixes have many fewer parts than used to be deemed necessary, and even fours exhibit a small trend in the same direction, though we have had some extremely simple fours for several years.

The greatest change, perhaps, is to be seen in the reduced number of attachments to the frame as engineers of assembling companies have made a very close study of this. The total number of hours work that go to the complete assembly of a 1916 chassis is smaller than would have been deemed possible a few years ago. It suggests the speculation as to how much further it will be possible to go.

Future Prosperity

THAT the phenomenal prosperity of the automobile trade in 1915 will be continued is the view meeting with general acceptance, and it is a reasonable view, for there seems every reason why the prosperity of trade in America should continue long after the war is over. The American automobile industry has this year been taxed to the utmost to meet the domestic demands, and has fallen far short of meeting the orders that have poured in from all over the world. Everywhere that Europe used to send automobiles, in the British colonies and dependencies, in Russia, in South America, there is more or less of an automobile famine. For one year the shortage of supply has not been serious to these countries, but next year it will begin to be, and in 1917 the markets will be starving for cars. It will be 1918 at the earliest before the European factories are able to ship automobiles in any quantity to count and meanwhile there is, on a rough but conservative computation, $100,000,000 of export business to be done by the American industry.

If the domestic demand continues, it seems improbable that the increased outputs planned will be able to take care of this foreign trade which means that it stands as a reserve market and an insurance against any unexpected drop in home demands. Never has any industry been in a happier position.

The History of the American Automobile Industry—10

Gurney and Hancock, Two Great Pioneers in the Development of the Steam Road Vehicle—Steam Stage Lines—32 M.P.H. Made by Two-Cylinder Three-Wheeler in 1831

By David Beecroft

¶ Review—Last week took up the development of the modern regime in steam vehicle construction dating from 1898 up to 1906, during which time over fifty American manufacturers were building steam automobiles in quantities and the steam vehicle was far ahead of the internal combustion engine driven machine. Several quaint and novel plans for vehicle propulsion were described, including the Gordon Squirrel steam car in which the engine was mounted inside of a large, wide wheel and tended to climb the wheel as the squirrel climbs its revolving cage, the weight of the engine thereby becoming the propelling power, the wheel being attached behind the vehicle and pushing the latter forward as it rolled. Griffiths, the first to develop a comfortable vehicle, was also mentioned and the semi-elliptic springs he used described.

This week some of the later developments in the steam car field are traced, showing the increasing practical application of steam for vehicle propulsion.

BETTER results followed the efforts of Sir Goldsworth Gurney, England, 1793-1875, who was educated as a doctor, practised as a surgeon, lectured on chemistry and other scientific matters, and was the inventor of the oxy-hydrogen blowpipe, the calcium light using an oxy-hydrogen flame on incandescent lime, and the steam jet for ventilating purposes.

Gurney began his experiments in 1823, when there was considerable public interest, and no doubt brought to his assistance the experience of the earlier workers. Of his first automobile but little is known, but it seems that he propelled it by legs or pushers like Gordon's. He next tried propelling wheels, this being about 1825 or 1826. In 1827 his new improved steam coach was brought out and seems to have been the most successful vehicle thus far. It carried twenty-one passengers, six inside the coach and fifteen on the outside or top seats. It was a six-wheeler, the main four wheels being practically such as would be employed upon a horse-drawn vehicle, but the pole instead of having horses was supported by two steering wheels, guided by a tiller in the hands of the operator, who sat very low in front with the throttle and brake levers close at hand.

Three reaches connected the axles and supported the two cylinders between them. One rear wheel only was driven, the other being loose to permit turning, but a clutch was provided that could be used to fix it to the axle when additional traction was required. In addition he fitted pushing legs that could be dropped and brought into use for hill climbing or any similar unusual service, but these were later removed. Brake shoes rubbing on the tires controlled the speed down hill and for stopping, and the engine could be reversed.

The boiler was tubular and fitted with fusible plugs. Four chimneys or smoke flues were used, but there was no smoke because coke and charcoal were burned. As in recent years, there must have been much apprehension lest these inventions of the Evil One should blow up, because *The Mirror*, London, of Dec. 15, 1827, explains that the boiler was "perfectly safe and could not burst or cause injury because of its new plan and philosophical principles." It made a run of 6 miles in 35 minutes, going up hill at 5 m.p.h., and attaining a speed of 14 to 15 m.p.h. in other parts, although the roads were heavy.

In 1828 this vehicle, or a successor, was sold to an iron master, Crawshay, and fitted for use as a tramway locomotive. Two years later Crawshay wrote that it could get up steam in less than 5 minutes, do 3 miles in 39 minutes and could draw 20 tons after it on an iron way, although it weighed but 3000 lb.

Two years later he again reported very favorably on its performance, and stated that it had needed but trifling repairs. In 1829, July 28, Gurney and a party started from London to Bath, three riding on the tractor and five in the carriage which it hauled. Others accompanied in horse carriages, and the speed averaged 12 m.p.h. At Melksham a crowd collected at a fair and was so dense it was impossible to move through except slowly. They were principally farm laborers and factory workmen, and considered the carriage injurious to their interests. With a cry "Down with machinery" they attacked the party, disabled Gurney and knocked the principal engineer senseless.

Carried 2600 Passengers

In the early part of 1831 Gurney's drags were used by Sir Charles Dance in a steam carriage service between Cheltenham and Gloucester. Three round trips daily, amounting to nearly 4000 miles, and carrying more than 2600 passengers, were made. The receipts were more than $10,000, and the fuel expense but one-third of this.

Public feeling, however, was strongly antago-

nistic. Various obstacles were placed in the way. Heaps of stone and in some instances loose stone barriers 18 in. high were placed across the roads, compelling the steam vehicles to turn into the fields to get around them. An axle having broken because of these obstructions, a general overhauling was given and no perceptible wear was found except in the crank bearings. Dance claimed that during this period the vehicles caused no accident nor injury to anyone, and the engines were never out of order. He secured his passengers because of lower than coach fares, but just as the project was beginning to show a working profit, the Turnpike Trust secured from Parliament an act permitting them to considerably increase tolls on steam carriages. This being done in various parts of the country, Gurney gave up the problem and later applied to Parliament for compensation for his losses. He claimed $180,000 direct and a very much greater indirect loss. The committee appointed found Gurney to be the first successful user of steam carriages on common roads, and recommended a grant of $80,000, which was not made, however.

Gurney had a very high opinion of the value of mechanical propulsion and succeeded in interesting a number of people in his devices. He gave up this line of work in 1831, partly because of a serious boiler explosion in one of his carriages in Scotland. Dance, however, continued for some time afterward, and in 1833 fitted a new boiler mostly of his own design. With this factor and a large coach trailer he attained speed as high as 16 m.p.h.

Hancock's Début

Walter Hancock (1799-1852), a great steam pioneer, was the son of a timber merchant and cabinet-maker in England, but apprenticed as watchmaker and jeweler, although he practised as a mechanical engineer. His brother Thomas is credited as being the founder of the india-rubber trade in England, an art since of great importance, if not an absolute necessity to the automobile.

Hancock invented about 1824 a very light, small steam engine which used a rubber bag instead of a cylinder and piston. This worked quite well on a small scale, and seemed to him the proper thing for motor vehicles because of its light weight and extreme simplicity. A trial, however, proved its unfitness, but Hancock, having started on motor vehicles, continued. He placed his engines vertically to keep them out of the dirt and dust, invented a boiler of flat chambers which permitted a pressure of about 100 lb., very high for those days; used a centrifugal fan for blowing the fire and exhausted the steam into the grate so that it passed up the chimney, instead of out into the road where it might scare horses. During his 12 or 14 years' connection with the industry, he built nine or ten different vehicles, one of which, running between London and Stratford, was the first motor vehicle to regularly carry passengers for hire. How closely the motor vehicle movement followed the demands of the times will be seen if we remember that the first line of London omnibuses was inaugurated in 1829 by a coachmaker

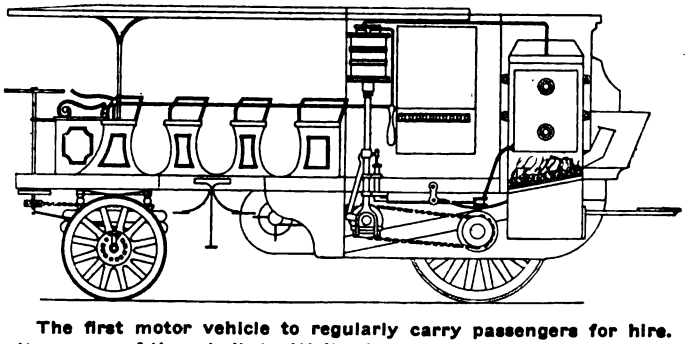
In August, 1834, Hancock started t
between London and Paddington.
plenty of passengers, the boilers ga
steam and every part worked with c
cess. When on one occasion one of the vehicles met with a mishap, Hancock sent to his shop for an extra which, having a two-speed gear, then considered a novelty, readily towed in the disabled car, although a hill had to be climbed. By the end of November, possibly owing to bad roads, the service was discontinued, about 4000 passengers having been carried.

10 m.p.h. in Ireland

In January, 1835, one of his vehicles was taken to Dublin and operated a short while by a steam coach company. It was brought back in August, and on a 75-mile and back journey showed an average of 10 m.p.h. The report of this run says it was well received everywhere and the bystanders were ready with assistance when required. Stops for water were necessary every hour or so. In the same year some experimental trips were made from London to Birmingham, and in 1836 three coaches and sometimes four ran on the Paddington Road, said to have been one of the least promising around London for such traffic. This venture between May and September carried nearly 13,000 passengers and ran every day except Sunday. In 1839, after 14 years' experience, he proposed a service from London to Birmingham, at 12 to 14 m.p.h., using a train having three trailing coaches, carrying eighty passengers, and 1.5 ton of goods; also a freight service of tractor with trailer van attached carrying 32 tons at 10 m.p.h.

32 m.p.h. in 1831

The fastest carriages of this earlier period seem to have been those of Summers & Ogle in 1831. Their first vehicle was a three-wheeler with a tubular boiler and two-cylinder engine, which is said to have attained a speed of 32 to 35 m.p.h., with a large number of passengers aboard. In view of the fact that their next vehicle with a three-cylinder engine and nineteen passengers made but 15 m.p.h., it is possible there is some error in the faster speed reported. The speeds were high for those days of poor roads.



The first motor vehicle to regularly carry passengers for hire. It was one of those built by Walter Hancock, a great steam vehicle pioneer. In August, 1834, Hancock started two steam carriages running between London and Paddington. This service was discontinued by the end of November, possibly owing to poor roads, about 4000 passengers having been carried

Chevrolet Capital $80,000,000

Increased from $20,000,000—Plan to Take Controlling Shares of G. M. C.

DOVER, DEL., Dec. 28—The Chevrolet Motor Co. of New York City has increased its capital from $20,000,000 to $80,000,000.

NEW YORK CITY, Dec. 24—The stockholders of the Chevrolet Motor Co., yesterday ratified the proposal of the directors of the company to increase the capitalization from $20,000,000 to $80,000,000, this step being taken in connection with a plan of that company to take over the controlling shares of the General Motors Co., by means of an exchange of stock. By this plan the General Motors stock, which has been obtained by a syndicate, is to be offered at a ratio of five shares of Chevrolet stock for one share of General Motors common. Under this proposal, between 110,000 and 120,000 shares of General Motors common will be offered.

The total number of shares represented at the meeting by proxy was 169,398 and in person 16,242, a total of 185,640. Somewhat over 100,000 shares of General Motors common will be affected by the proposed plan. The stock represents the holdings of W. C. Durant; Lamont Berlin, director of Aetna Explosives Co.; Pierre Du Pont; S. F. Prior of the Union Metallic Cartridge and Remington Arms Co. and J. A. Haskell, A. H. Wiggen, C. S. Sabin, and a few others, many representing Durant interests.

The acquisition of a controlling interest in General Motors by the Chevrolet company would make it the automobile company with the largest capital in the country.

A Step Toward Merger?

It is rumored that the increase of stock is a step toward the merger of the two companies. It is stated that Mr. Durant and his associates representing the Du Pont powder and Remington arms interests has secured enough General Motors stock to give them complete control of the company. It is estimated that including the holdings of his associates, Durant controls as much as 60 per cent or 70 per cent of General Motors stock.

Mr. Durant stated yesterday that the Chevrolet company on its present earning basis will show approximately 20 per cent on its present capitalization. Thus far the production had been at the rate of 185 cars daily, and it is estimated that by January this will be increased to 220 cars a day. By March it is planned to increase the output to 350 cars a day.

General Motors is unaffected by the plan and has nothing to do with it. Certain holders of General Motors stock entertain a proposal to exchange their shares for shares in another company. The remaining General Motors stock remains as at present, the only effect being that the floating supply is much reduced.

Sales of cars in General Motors are running in excess of 10,000 cars a month and its gross receipts in excess of $10,000,000 a month. It is estimated that the results for the current year will show a total of more than 120,000 cars made and sold, gross receipts in sales of $120,000,000 and net profits in excess of $24,000,000, or approximately 150 per cent on the outstanding $16,500,000 in common stock.

American Chain Co. to Take Over Weed Company

BRIDGEPORT, CONN., Dec. 28—After Jan. 1 the name Weed Chain Tire Grip Co. will begin to fade from the business world. Its place will be taken by the American Chain Co., and the company requests that all correspondence be addressed to the latter corporation. There is to be no change in personnel, management, policy or product.

The American Chain Co. was formed several years ago and is practically identical with the Weed company. It was created to establish a distinct manufacturing department to deal with production problems, but with the completion of a new factory the consolidation toward which the two companies have been working will be made effective.

Celfor Tool to Manufacture M. & S. Differential

DETROIT, MICH., Dec. 29—The Celfor Tool Co., Buchanan, Mich., has been licensed to manufacture the M. & S. differential and will use this differential as stock in all its axles as soon as facilities can be completed to manufacture them. The Celfor company is at present building a plant in South Bend, Ind., to be known as the South Bend Gear Co. which plant will manufacture solely the M. & S. differentials for the Celfor axles. A. E. Coom, will be manager of the factory the offices of which will be in the J. M. S. Building, South Bend. It is expected that the Celfor company will start deliveries in January. The M. & S. differential will be interchangeable with the other conventional types of differentials at present used in Celfor axles.

Fiat Gets Enger in East

NEW YORK CITY, Dec. 28—The Fiat Motor Sales Co., this city, has become distributor of the Enger for practically the whole of the Eastern territory. The company still represents the Fiat.

To Probe Gasoline Prices

Federal Trade Commission to Investigate Alleged Oil Shortage

WASHINGTON, D. C., Dec. 28—*Special Telegram*—The Federal Trade Commission is preparing to investigate the high cost of gasoline in two ways: First, by ascertaining the truthfulness of charges that in places where there is active competition between the large oil companies, prices are normal, while in sections where no competition exists the price is fixed upon the basis of all the "traffic can bear." Second, to ascertain whether there is an actual shortage of crude oil as alleged in some quarters as an excuse for hoisting the price. The Geological Survey keeps accurate oil production statistics which will facilitate the work. It is said that one prime object of the investigation will be to eliminate the middleman who receives an undue profit at the expense of producer and consumer.

It is practically certain that a congressional investigation of the subject will be proposed after the holidays. The Federal Trade Commission has all the power of any committee of Congress and also the benefit of expert technical assistance. Furthermore, it can inflict punishment for any violation of law and adopt remedial measures.

Two reasons given by the producers for the unprecedented series of advances in the price of gasoline in the past seven months are the decline of production and the tremendously increased demand due to the rapidly growing use of automobiles and motor trucks.

The following table of average prices in cents for the past five years up to Dec. 28 shows the marked upward trend:

Year	Opening	High	Low	Closing
1911	11	11	9	9
1912	9	16	9	16
1913	16	17	16	16
1914	16	16	13	16
1915	13	21	12	21

The increase in the price of fuel in cents in the past seven months is:

Month	Texas (Wholesale)	Standard (Wholesale)	To Consumer
May	12	11	11-15
June	12	12	12-15
August	14	14	14-17
August	15	15	15-19
September	16	16	18-22
October	17	17	18-23
November.	18	18	18-24
November.	19	19	19-25
December.	20	20	20-26
December.	21	21	21-27

Singer Builds Tire Stitcher

NEW YORK CITY, Dec. 29—The Singer Sewing Machine Co. has entered the automobile field with a machine for sewing treads on used tires of automobiles. The machine can be operated up to a speed of 250 stitches per minute and can be driven by a motor of ⅝ hp. or by foot.

Motor-Generator Patents Valid

Court of Appeals Declares Coleman Single-Unit Patents Valid and Infringed

NEW YORK CITY, Dec. 28—The Coleman patents, covering drive in motor-generator starting and lighting equipment, have been declared valid by the circuit court of appeals. These patents, which are owned by Conrad Hubert, who has licensed the Dayton Engineering Laboratories Co., maker of Delco apparatus, have been in the courts in an infringement suit brought against the Sidney B. Bowman Automobile Co., the New York dealer that sold a Marmon car fitted with a North East motor-generator starting and lighting system.

The court of appeals not only has declared these patents valid, but also that they are infringed by the North East device as fitted on the Marmon car cited in the case. The construction referred to in the patents applies to what is known as single-unit systems, namely those in which the electric starting motor and the electric generator are combined in one unit.

The Two Patents

The two patents involved were granted to C. J. Coleman under dates of Nov. 24, 1903 and Jan. 29, 1907. The earlier of these patents, No. 745,157, directly specifies a means for starting an automobile engine by the application of a motor-generator and for using the engine for the purpose of re-storing energy which would subsequently be used in making a start. This patent also described the means for the control of the vehicle's speed ratio. The system, as described, consists of a motor-generator connected through a train of gears to the crankshaft, the latter having a differential conection with the motor-generator so that the latter drives at one speed ratio and is driven at another. This differential connection is effected by having two sets of gearing which can be used alternately by means of a friction clutch.

The second patent, No. 842,827, deals with the means provided for automatically changing the motor-generator functions from those of a motor to those of a generator according to crankshaft speed and also for giving a maximum torque for starting. Special provision is made in this patent for controlling the speed of the engine so that it will drive the motor-generator as a dynamo at a constant speed.

The complaint is based on the following: On March 24, 1913, the Bowman company sold a four-cylinder Marmon car equipped with a single-unit electric starter made by the North East Electric Co., Rochester, N. Y., which device the Dayton Engineering Laboratories Co. claims to infringe the Coleman patents owned by Conrad Hubert and under which the Dayton company is the licensee. Suit was brought in July, 1913, and the Bowman interests cited numerous patents issued to inventors covering starters and analogous constructions to prove their contention that the patents were invalid and that there was no infringement. The district court decided that both patents were valid but that only No. 745,157 was infringed. Neither side being satisfied with this decision, cross appeals were made to the circuit court of appeals with the result that the validity of both patents was sustained but that No. 842,827 was also held to be infringed.

This decision of the circuit court of appeals brings the litigation to an end, the validity of the basic Coleman patents covering the single-unit type of electric starter being established.

—

Weidely Motors Co. Now—Capital Increased to $350,000

INDIANAPOLIS, IND., Dec. 24—At a stockholders' meeting of the Weidely Motor Co., this city, held yesterday afternoon, the capital stock of the company was increased from $100,000 to $350,000 and the name of the corporation changed to Weidely Motors Co. The arrangement for additional capital was made necessary by the increasing demand for the Weidely twelve-cylinder, valve-in-head motors.

The officers of the company for the ensuing year are: President, W. E. Showers; vice-president and general manager, G. A. Weidely; secretary and treasurer, W. A. Umphrey, who with Edmund Rosenberg and L. A. Coleman, compose the board of directors.

—

Mason Car to Resume

DES MOINES, IOWA, Dec. 24—George R. Mason, formerly manufacturer of the Mason car, has opened here the Mason Motor Service Co. in the old Mason factory and announces that he plans to resume the manufacture of Mason cars here as soon as practical.

—

Dahlquist with Timken-David-Brown

BUFFALO, N. Y., Dec. 28—Charles S. Dahlquist, chief engineer of the Lippard-Stewart Motor Car Co., this city, has been appointed manager of the Timken-David-Brown Co., Detroit, Mich. Carl D. Peterson, assistant engineer with Mr. Dahlquist, becomes chief engineer of the Lippard-Stewart company.

Boston Blacking Enters Field

To Make and Market Complete Line of Cleaning and Polishing Preparations

EAST CAMBRIDGE, MASS., Dec. 27—The Boston Blacking Co. of this city, one of the largest manufacturers of polishes and cements for the shoe and leather trade, has entered the automobile accessory field with a very complete line of cleaning and polishing preparations for all parts of the car. This company, with factories in nine different countries and with branch offices and warerooms in all the larger cities of the United States, is taking up the question of manufacturing automobile polishes not as an experimental department but as a standard arm of its business. The various polishes will be marketed through the regular channels of automobile jobbers, dealers, etc., and the various merchandise will be put up in pints, quarts and larger quantities for convenient merchandising. The goods are marketed under the trade name of Be-Be-Co. which is carried by all goods of the company.

Among the various polishes specially intended for the automobile are: Mohair top dressing, leather top dressing, top lining dye, seat and slip cover cleaner, cushion dressing, metal and body polishes, giving gloss and dull finishes, brass polish, nickel polish, body polish, motor car soap, hand cleaners and red, white and gray tire paints.

The company has branch factories in Chelsea, Mass., Montreal, Que., England, Germany, France, Austria, Sweden, Italy and Australia, and branch offices and warerooms in all the large cities of the United States.

Packard Buys Land for Aviation Tests Next Spring

DETROIT, MICH., Dec. 24—It was announced by Vice-president of Engineering J. C. Vincent, of the Packard Motor Car Co., that this company recently acquired a large tract of land on Lake St. Clair, near Mt. Clemens, to be used as an aviation field. As was stated very recently by President Henry B. Joy, of the Packard company, the company is becoming strongly interested in aviation matters. Tests with aeroplane motors have been going on for six months. Experiments and testing on the aviation ground will probably be started in the spring. The first experimental aeroplane has been ordered from a New Jersey concern. The Packard company does not expect to make complete aeroplanes at least for the time being, concentrating upon motors.

Hudson Stock Super-Six Makes 75.7 Miles in Hour in A. A. A. Test

New Model with Stock Equipment Accelerates from Standing Start to 60 M.P.H. in 23 Sec.—Official Trials Precede Announcement of Car

NEW YORK CITY, Dec. 27—On Nov. 18, 24, 25 and 29 the new Hudson Super-Six, which makes its first appearance this week, was put through a series of sanctioned tests on the Sheepshead Bay speedway. The tests, conducted by F. E. Edwards representing the contest board of the American Automobile Association, consisted of acceleration and speed trials in which the stock touring car with three passengers attained a speed of 60 m.p.h. in 23 sec. from a standing start, a speed of 50 m.p.h. from standing start in 16.2 sec. and starting from 5 m.p.h. in high gear accelerated to 30 m.p.h. in 10 sec. and to 50 m.p.h. in 19.4 sec. In addition to these trials the Hudson Super-Six, with two passengers, was run for one hour in which time it completed 75.689 miles and with five passengers and top and windshield up completed 70.742 miles. The final test consisted of a 100-mile trial, this distance being covered by the same car in 1:41:40, an average speed of 74.67 m.p.h. Obviously, to attain these average speeds it was necessary to run without interruption.

The car was under close observation from time of completion to arrival at factory after the test, F. E. Edwards checking it before, during and after trials.

The car is one of the new 1916 Hudson seven-passenger touring cars fitted with a six-cylinder block cast 3½ by 5 motor; wire wheels and Goodrich Silvertown cord tires 34 by 4. The weight of the car without passengers, but with all liquid compartments filled was 3164 lb. All the motor equipment usually supplied was left intact, so there is no doubt of the car coming under the stock classification as designated by the rules of the American Automobile Association. The gasoline used for all tests showed 58½ deg. Baumé at 40 deg. Fahr.

Acceleration Trials

The acceleration trials were conducted on Nov. 18. In the opening trial the car, with windshield up, was driven by C. H. Vincent, experimental engineer of the Hudson company, and beside him was F. E. Edwards of the A. A. A. and in the tonneau H. A. Tarantous, Edwards' assistant. Starting from 5 m.p.h. in high gear the driver was given a signal to accelerate and when the car had attained a speed of 30 m.p.h. the watches showed 10 sec. and at 50 m.p.h. 19.4 sec. These times were taken by two watches and these checked, exactly. In the next acceleration trial, held a few minutes after the first, the car with the same driver and passengers was made to accelerate to 60 m.p.h. from a standing start and going through the gears. The car was stopped, and at a given signal the driver started, shifting into first, second and high, after which a speed of 60 m.p.h. was attained, the time taken being 23 sec. A reading taken at 50 m.p.h. showed 16.2 sec. During these trials the windshield was up, as stated previously, and the top folded.

Owing to the severity of the weather the next test was run on Nov. 24, on which day the thermometer showed 42 deg. F. The trial was for one hour with the car containing five persons, and both top and windshield were up. The Hudson Super-Six, the same car which was used in the acceleration trials, made a flying start at 3.36 p. m. and in one hour completed 70.742 miles, and as in the other trials which followed consistent running was a most noticeable feature. The variation in lap time never exceeded 1.8 sec., the slowest lap recorded being 1.41.2 and the fastest 1.39.4. The driver, Ralph Mulford, drove well up on the highly banked turns, which means that the car traveled slightly more than two miles to the lap. The car with all passengers weighed 3986 lb.

Made 75.689 Miles in Hour

As the weather permitted it, the next trial was run on the following day, Nov. 25, and this test consisted of a one-hour run with two passengers, Ralph Mulford driving and C. Vincent in the seat beside him. The top was folded and the windshield halves were placed in a horizontal position. The driver guided the car around the speedway, for a few laps to warm up the engine and at a given signal from the mechanic timing was started. The official start was 11.03 p. m. and at the finish of the hour the car had traveled 75.689 miles. The fastest laps made during this one-hour run were the sixth and eighth, both of which were made in 1:33.80 an average of 76.75 m.p.h.

One of the most remarkable performances of the Hudson was made under adverse conditions in the 100-mile test which was conducted on Nov. 29. During this test there was a variation in temperature from 48 deg. Fahr. at the start to 43 deg. at the finish. The 100 miles were completed in 1:41:40 an average of 74.67 m.p.h. and for this whole period the motor was turning over at about 2600 r.p.m.

New Car in Rock Hill, S. C.

ROCK HILL, S. C., Dec. 31—Automobiles are now being manufactured in this city by the Anderson Motor Co., a concern which occupies the premises and is made up of the same officials as the Rock Hill Buggy Co. The car, which was designed by Joseph Anglada, consulting engineer, is a six and is equipped with a complete line of accessories, including electric searchlight on the windshield, tonneau heater and electric cigar lighter. The price of the car, which is known as the Anderson Six-40-Six, is $1,250.

The car is assembled and the specifications include the Continental six 3¼ by 4½-in. unit power plant with Covert transmission, Borg & Beck dry-disk clutch and Mott axles. The wheelbase is 120 in., and the tires 33 by 4.

Niblette Resigns from Goodrich Branch

BUFFALO, N. Y., Dec. 27—H. B. Niblette, general manager of the local branch of the B. F. Goodrich Co., has resigned, after being with the company for seventeen years. He will temporarily make his headquarters at the Knickerbocker Hotel, New York City, beginning Jan. 3.

Frontenac Motor Co. to Build Louis Chevrolet Racers

DETROIT, MICH., Dec. 23—A team of racing cars designed by Louis Chevrolet, is expected to take a prominent part in the speedway races in this country next year, according to the plans of the Frontenac Motor Co., which has been organized here and incorporated, to build and campaign them.

Louis Chevrolet is president of the Frontenac company and associated with him are Joseph Boyer, Jr., as secretary-treasurer and V. R. Heftler as vice-president. Mr. Heftler will be recognized as president of the Zenith Carbureter Co. and Mr. Boyer is interested in the Springfield Metal Body Co. Another of the incorporators is William Small, who is agent for the Chevrolet car in Indianapolis.

Maxwell Goes 12,405 Miles in 25 Days

LOS ANGELES, CAL., Dec. 28—A stock Maxwell touring car, under official observation by the American Automobile Assn., and as part of a motor non-stop run still in progress, has established the following road records: 5000 miles in ten days; 10,000 miles in twenty days, and 12,405 miles in twenty-five days.

Van Ness Resigns from Great Western

PERU, IND., Dec. 27—F. W. Van Ness has resigned as general manager of the Great Western Automobile Co., this city.

Daniels and Wood to Speak to S. A. E.

Sec. of Navy and Maj. Gen. of Army To Discuss Transport Problems

NEW YORK CITY, Dec. 28—As a climax to its winter meeting, the Society of Automobile Engineers will make the practical requirements for national preparedness the leading thought at the annual banquet at the Hotel Plaza, Thursday evening, Jan. 6, which will mark the conclusion of its New York mid-winter session. The Honorable Josephus Daniels, Secretary of the Navy, who originated the Naval Consulting Board, in which the S. A. E. is actively represented by two of its past-presidents, will address the members, while Major-General Leonard Wood, U. S. A., will discuss the army transport problems. Alfred Reeves, general manager of the National Automobile Chamber of Commerce, will speak for the manufacturing end of the industry.

An attendance of more than 500 is expected at the banquet, which is to be one of the most elaborate affairs ever undertaken by the Society, and many special features have been planned. Among the guests, in addition to the principal speakers and their aides, will be the president and directors of the automobile Chamber of Commerce and the presidents of many of the other leading technical societies.

Prominent British Dealers Here

NEW YORK CITY, Dec. 28—On Christmas morning there landed from the Lapland the well-known London dealer and former racing driver Charles Jarrott who is on a mission here in connection with business on behalf of the Russian government. It is also his intention to look around the New York show, though he does not admit that he is seeking anything in particular for his regular business. He stated that he expected to spend about four weeks mostly in the East before returning to England.

On the same boat was J. B. Ferguson, designer of the ingenious Irish car which was described in THE AUTOMOBILE for Dec. 9. He has one of his chassis with him and will exhibit it at Grand Central Palace, on the third floor, the idea being to demonstrate the very latest development of British engineering. It will be remembered that the car has a complete self-lubricating system.

McIntyre Farm Tractor $750

COLUMBUS, OHIO, Dec. 24—The McIntyre Mfg. Co., this city, is arranging to put on the market about Feb. 1 a 12-hp. gasoline farm tractor which will retail at $750. The company, which has been making some automobile parts and special machinery, has been experimenting on the new tractor for some time.

The tractor will be designed both for hauling farm machinery and wagons and to furnish stationary power for farm work. It is mounted on three wheels with the two wheels in the rear. The company has placed contracts for materials and will be ready to make deliveries Feb. 1.

Eveready Starter for Fords

LONG ISLAND CITY, Dec. 24—A new electric lighting and starting system for Fords has been put out by the American Ever Ready Works, Long Island City. The starter is mounted in front of the radiator directly on the front of the crankshaft in order to eliminate side strains on the crankshaft. Since this position is on the center line of the crankshaft, the stresses are at a minimum. The starter runs at engine speed and it is claimed by the manufacturers that it acts as a vibration damper, due to the flywheel effect. The drive is through a flexible coupling without chains. The entire system is inclosed in a small black enamel case and the time required for attaching is about 1 hr.

Moline Plow Co. Names New Car the Stephens

FREEPORT, ILL., Dec. 24—The Stephens is the name chosen for the new car shortly to be constructed by the Freeport branch of the Moline Plow Co., the falling off in the demand for buggies and farm wagons forcing the company to engage in the construction of automobiles in order to keep the plant working on full time and with a full force. M. A. Steele, manager of the Freeport plant is in Detroit supervising the construction of the models. Two cars are being made and are due to reach Freeport Jan. 1. They will then be given a 5000-mile test run. The output for the first year will be approximately 600.

Master Spark Plug is Now Called Master Calorite

HARTFORD, CONN., Dec. 24—The Hartford Machine Screw Co., this city, maker of the Master spark plug has changed the name of its product to the Master Calorite spark plug.

The company has adopted a new insulating material known as calorite which is stated to be unaffected in an instant change in a temperature of 2300 deg., and also fracture proof. The new material, which is a special composition and made in this country, is somewhat similar in appearance to porcelain, although it is greyish in color and has not such a glossy appearance.

1,200,000 Cars and Trucks for 1916

892,618 Motor Vehicles Sold in 1915—842,249 Passenger Cars—50,369 Trucks

NEW YORK CITY, Dec. 28—According to statistics compiled by Alfred Reeves, general manager of the National Automobile Chamber of Commerce, the production of motor vehicles in this country for 1916 will exceed 1,200,000. On the basis that anyone with an annual income of $1,200 can own a car, there is a market in the United States for 5,000,000 cars. Other statistics given are:

Motor vehicles sold during 1915	892,618
Retail value of these vehicles	$691,778,950
Passenger cars sold in 1915	842,249
Retail value of passenger cars	$565,856,450
Motor trucks sold in 1915	50,369
Retail value of motor trucks	$125,922,500
Carloads of automobiles shipped in 1915	200,000
Money spent on highways in 1915	$250,000,000
Proportion of motor vehicles to miles of road	1 to 1
Proportion to area of U. S. in sq. miles	1 to 1½
Proportion of cars to population of U. S.	1 to 48
Total manufacturers of cars and trucks	448
Commercial vehicle manufacturers	257

By way of contrast, the production in 1899 was 3700 motor vehicles valued at $4,750,000 and in 1903 it was 11,000, the value being $12,650,000.

Tire Prices to Be Raised 12½ to 20 Per Cent

NEW YORK CITY, Dec. 27—Tire prices are scheduled to advance 12½ to 20 per cent with the advent of the new year. For some time the increasing price of crude rubber as well as fabric and other materials used in tire construction has been the basis of a rumor to the effect that the leading tire manufacturers were about to announce new lists considerably in advance of those now in force.

Firestone Distributing Plant for K. C.

KANSAS CITY, MO., Dec. 27—The Firestone Tire & Rubber Co. has been granted building permits in Kansas City, Mo., for the erection of an eight-story reinforced concrete building to be used as a distributing plant at Twentieth Street and Grand Avenue. The cost is estimated at $180,000. The building will be completed by June 1.

New Acme ¾-Ton Truck

CADILLAC, MICH., Dec. 28—The Cadillac Auto Truck Co., this city, has announced a new ¾-ton truck to sell at a reasonable price.

Jack with Aeromarine Plane & Motor

TORONTO, ONT., Dec. 27—R. K. Jack, chief engineer of the Russell Motor Car Co., this city, has been appointed engineer and factory manager of the Aeromarine Plane & Motor Co., New Yor' City.

Baker-R & L 8½% Stock Dividend

Will Increase Outstanding Common from $1,382,000 to About $1,500,000

CLEVELAND, OHIO, Dec. 27—The Baker-R & L Co., with which the Owen Magnetic Co. was recently incorporated, has declared the quarterly dividend of 1¼ per cent on the preferred and common stocks, and a dividend of 8½ per cent payable in common stock to the holders of common stock. The outstanding common stock at the present time is $1,382,000 and the stock dividend will increase this to approximately $1,500,000.

A statement, as yet unconfirmed, has been made that the new interests in the company will acquire $1,000,000 of the new common stock, which will bring the issue up to about $2,500,000.

New Era Opens Bank Accounts for Employees

JOLIET, ILL., Dec. 24—The New Era Engineering Co., this city, has opened for each of its employees a savings account with the First National Bank, this city. Employees for three months and over are given credit for $5; and each employee who has been with the company for less than three months, $2.50. The company will pay, in addition to the 3 per cent given by the bank, 2 per cent on the employees' salaries deposited in this bank during the coming year.

Federal Truck Increases Wages 5 to 10 per Cent

DETROIT, MICH., Dec. 24—A bonus of from 5 to 10 per cent of their yearly salary was the Christmas present which the Federal Motor Truck Co. gave to its employees this year. The 10 per cent bonus went to those who had been on the company's payroll one year or longer; a bonus of 7½ per cent went to those who have been with the company from nine months to one year and the 5 per cent bonus to those with the company from six to nine months.

According to Vice-president M. L. Pulcher, this policy is giving excellent results, as it tends to reduce very materially the number of employees leaving the company during the year. During 1915, the number of employees who have been on the payroll for one year or more was increased 15 per cent over the previous year.

McLean Tire Buys Morgan & Marshall Co. Factory

CLEVELAND, OHIO, Dec. 27—The McLean Tire & Rubber Co., this city, has purchased the plant of the Morgan & Marshall Co., East Liverpool, Ohio, and will start operation in January.

With its present equipment the company will be able to turn out 500 casings and 500 tubes per day, together with an unlimited amount of accessories. A tire with a 4000-mile guarantee will be made.

J. C. McLean, president of the M. & M. Co. will also be president of the McLean Tire & Rubber Co., and W. B. Davis will be an officer, also.

$10 Accounts for Lewis Axle Employees

JACKSON, MICH., Dec. 24—Over 400 workers of the Lewis Spring & Axle Co., maker of the Hollier eight, received as a Christmas gift from the company a Union Bank pass book, with $10.

Timken Axle Employees Get Bonus

DETROIT, MICH., Dec. 27—Between $12,000 and $14,000 was distributed among the employees of the Timken-Detroit Axle Co., this year, as a Christmas bonus.

2½ per Cent Dividend on Lozier Claims

DETROIT, MICH., Dec. 27—A third dividend of 2½ per cent on approved claims against the Lozier Motor Co., which was adjudicated bankrupt a year ago, is being paid this week by the Detroit Trust Co., making a total distribution of 12½ per cent since the receivership. This distribution totals $80,000.

Steel Prices Are Higher

Rubber Rises to 81 Cents—Copper Quotes at 21½ Cents—Sulphuric Acid Up

NEW YORK CITY, Dec. 28—Prices in the automobile materials market have reached unprecedented marks. Bessemer and open-hearth steel, for instance, have nearly doubled the prices in effect last spring. Last week both grades of steel went up $2 per ton, Bessemer reaching $32 and open-hearth $33. Although copper advanced sharply last week, the prices in general are not as high proportionately as in some of the other metals. Both lake and electrolytic grades of copper went up yesterday to 21½ cents a pound, just 1¼ cents higher.

A few of the metal prices dropped. Aluminum closed yesterday at 53 cents, or 3 cents lower than last Tuesday's quotation. Tin dropped 25 cents per 100 lb., closing at $39.25.

Sulphuric acid went up 50 cents. Refined rapeseed oil closed yesterday at 96 cents, just 6 cents higher.

Fine up-river Para rubber prices last week saw a gradual increase from 77 cents on Tuesday to 81 cents yesterday. Ceylon first late crepe prices went up to 91 cents. The market for crude rubber shows an increased demand reported from the manufacturers.

H. A. Lozier Co. Elects

CLEVELAND, OHIO, Dec. 28—The H. A. Lozier Co. has been formally organized by the selection of the following officers: H. A. Lozier, president; E. W. Foote, vice-president; E. G. Tillotson, treasurer, and Frank H. Ginn, secretary. Mr. Tillotson is the head of the bond house of the Tillotson & Wolcott Co. and Frank H. Ginn is a prominent attorney.

To Build Taxis on Coast

SAN FRANCISCO, CAL., Dec. 24—Final arrangements have been made by R. P. Mathews and G. M. Anderson of the Gray Taxicab Co., this city, for the establishment of their taxicab factory. As the result of having secured a monopoly of the taxicab service from all of the stations of the Southern Pacific system, the Gray Taxicab Co. has purchased the Goldy Machine plant at Sunnyvale, 30 miles south of San Francisco.

The company plans to employ 125 men from the start and will turn out seven or eight cars a day until they have supplied the demand in all of the cities along the Southern Pacific system. The new company will be known as the Andermat Machine Co.

The property of the Goldy Machine Co.

includes 20 acres of land adjoining the main line of the Southern Pacific. The factory includes four main buildings and several smaller buildings. The two main buildings are 150 by 200 ft., the foundry is 100 by 200 ft., while the boiler room is 50 by 100 ft. The purchase price of the Goldy works is said to be $50,000 to $60,000.

White Motor Co. Incorporated

CLEVELAND, OHIO, Dec. 28—The White Motor Co., this city, has been incorporated to take over the business of the White Co. under plans recently announced. The initial capital stock was placed at $20,000, but Attorney M. B. Johnson of the firm representing the interests in the company, stated that an increase had already been made to $16,000,000.

New Louisville Co. to Make Cars in Kentucky Wagon Plant

LOUISVILLE, KY., Dec. 24—Announcement was made here to-day of the plan to organize a new concern to manufacture and assemble automobiles at the plant of the Kentucky Wagon Mfg. Co. The line will include a truck, five-passenger four-cylinder touring car and a roadster. The car will have a 112-in. wheelbase and will sell for $750.

Cassidy Takes Long Horn Sales

NEW YORK CITY, Dec. 24—The management of the sales department of the G. Piel Co., manufacturer of Long horns and G-P muffler cut-outs, on Jan. 1, 1916, will be turned over in its entirety to the newly formed selling corporation of the Edward A. Cassidy Co.

Security Prices Are Lower

General Motors Common Down 6 Points—Chevrolet Stock Lowered 9 Points

NEW YORK CITY, Dec. 28—Last week's automobile and accessory securities were subject to many small changes. A feature of the issues during the last two weeks has been the absence of any extraordinary gains such as General Motors and Paige-Detroit experienced. General Motors, incidentally, after a 37-point drop the previous week, dropped 6 more points last week. And Chevrolet, which is closely allied at the present time with General Motors, has again dropped, this time 9 points, making a total of 19 points in two weeks. Chalmers common, which has been showing little activity heretofore, dropped 20 points to 130. Willys-Overland common closed at 239, just 4 points lower.

Tire issues show considerable strength. Portage Rubber common went up to 70 with a net gain of 10 points; Miller Rubber preferred rose 2 points; Kelly-Springfield common rose 7 points; Goodrich common closed 2¼ points gain, and U. S. Rubber common rose 1 point.

Several of the automobile issues showed substantial gains. Packard common closed at 180 or 5 points higher; Reo Car went up 11 points; and the three Maxwell issues showed fractional gains. To-morrow Maxwell perferred will sell ex-dividend 14¼ per cent. Based from yesterday's price, this will mean a figure below 90 for the stock, or an income basis of about 8 per cent.

The Detroit issues were correspondingly lower. General Motors dropped to 425 the total drop amounting to 57½ points. Its preferred closed at 114 with a loss of 4½ points. Paige dropped 10 points. The new issue of stock of the Ford Motor Co. of Canada, Ltd., went down 15 points.

Maxwell Earns $1,469,809 in Quarter Ending Oct. 31

NEW YORK CITY, Dec. 24—The Maxwell Motor Co. reports for the three months ended Oct. 31, 1915, net earnings from operations, after deducting costs of manufacturing and expenses of advertising, selling, administration and taxes of $1,425,489; other income including cash discounts on goods purchased $60,949; sundry miscellaneous revenue, $10,370; giving a total of $1,469,809. The balance sheet shows profit and loss surplus $4,492,106 and total assets and liabilities of $44,081,631.

Mais Resigns From Burford

HARRISBURG, PA., Dec. 24—A. F. Mais has resigned as chief engineer of the H. G. Burford Co., Fremont, Ohio, to become chief engineer of the Morton Truck & Tractor Co., this city.

1000 Lee Tires a Day

NEW YORK CITY, Dec. 28—Production of the Lee Tire & Rubber Co. is now at the rate of 1000 tires a day. During the month of November the sales of the Lee company were 25 per cent greater than they were in November, 1914.

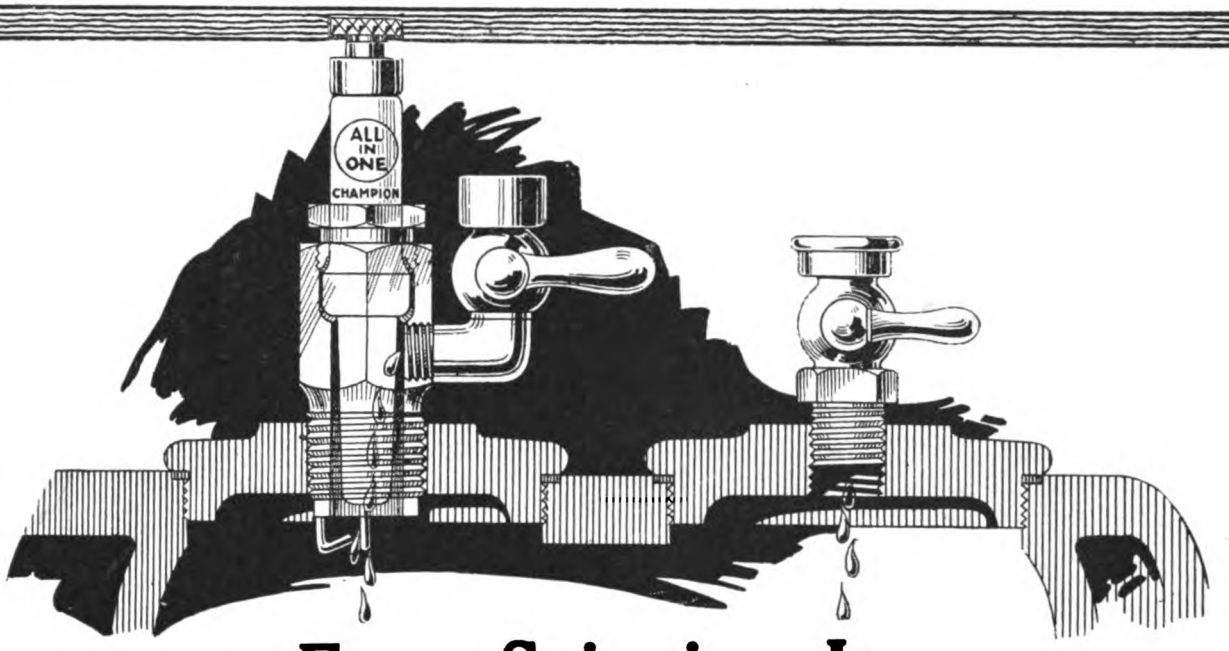
ABLE of CONTENTS

NEW YORK, DECEMBER 30, 1915. No. 27



Even Spinning It Will Not Start That Cold Motor

—not if it's a really cold day.

Not even if you prime through the priming cup or by removing the plugs.

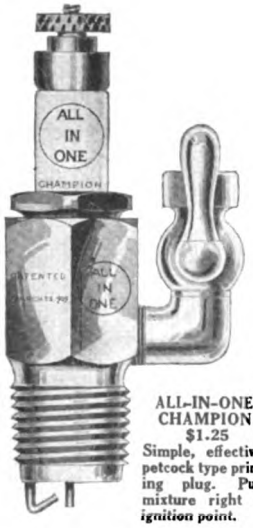
But there is a sure way.

Tho' gasoline will not vaporize fast enough in a cold cylinder to spread across the combustion chamber—to reach the ignition point—

You can put it right at the spark gap of an

"All-In-One" Champion Priming Plug

"TOLEDO MADE FOR THE WHOLE WORLD'S TRADE"



ALL-IN-ONE CHAMPION
$1.25
Simple, effective, petcock type priming plug. Puts mixture right at ignition point.

That's the sure way.

No need to prime and prime again in the old way—no need to freeze your fingers—no need to lose time.

The All-In-One Champion is a combination spark plug and priming cup. The gasoline runs down through the center of the plug and actually collects on the electrodes—right where the spark flashes.

It spreads around the rim and entirely surrounds the spark gap with a cloud of rich vapor, so when the first spark jumps there's an explosion—and your motor starts, every time.

And that is why motorists everywhere are demanding Champion Priming Plugs.

Far sighted dealers already have ordered their entire winter's stock. They are getting full benefit of the extensive advertising campaign now running in the biggest national farm and trade periodicals.

Now is the time for **you** to order. See your jobber, or write to us at once.

Champion Spark Plug Company

1003 UPTON AVENUE **TOLEDO, O.**

The New SERIES 17 Cars

Studebaker for the FIFTH time leads the industry

The SERIES 17 line is the most complete that any manufacturer has ever offered. There are 9 pleasure cars in all—3 on the 4-cylinder chassis and 6 on the 6-cylinder chassis—comprising open cars and a variety of closed cars that gives the Studebaker Dealer a car for every prospective buyer's taste.

There is in addition a series of Commercial Cars that offer GREAT sales possibilities — three of the half ton size that have already won such national popularity and three new TON capacity trucks.

But the sensational thing of the entire series of cars is the amazing VALUES that they represent. Never in the history of the entire industry have such values as these been placed upon the market at such LOW prices.

And coming in a season like this, when prices of raw materials are rising daily, the new SERIES 17 SIX, with added new features and priced at $1050, and the new SERIES 17 FOUR, with the same new features, *reduced in price* to $845, are most astonishing achievements even for a manufacturer with Studebaker's resources and unexcelled manufacturing facilities.

With the new SERIES 17 cars, every Studebaker Dealer now has before him a wonderful opportunity for BUILDING up a lasting business—and for greatly increasing his winter sales with the absolute assurance of getting cars thro' the Spring when he wants them most—and assurance, also, of a steady sale and PROFIT the year 'round.

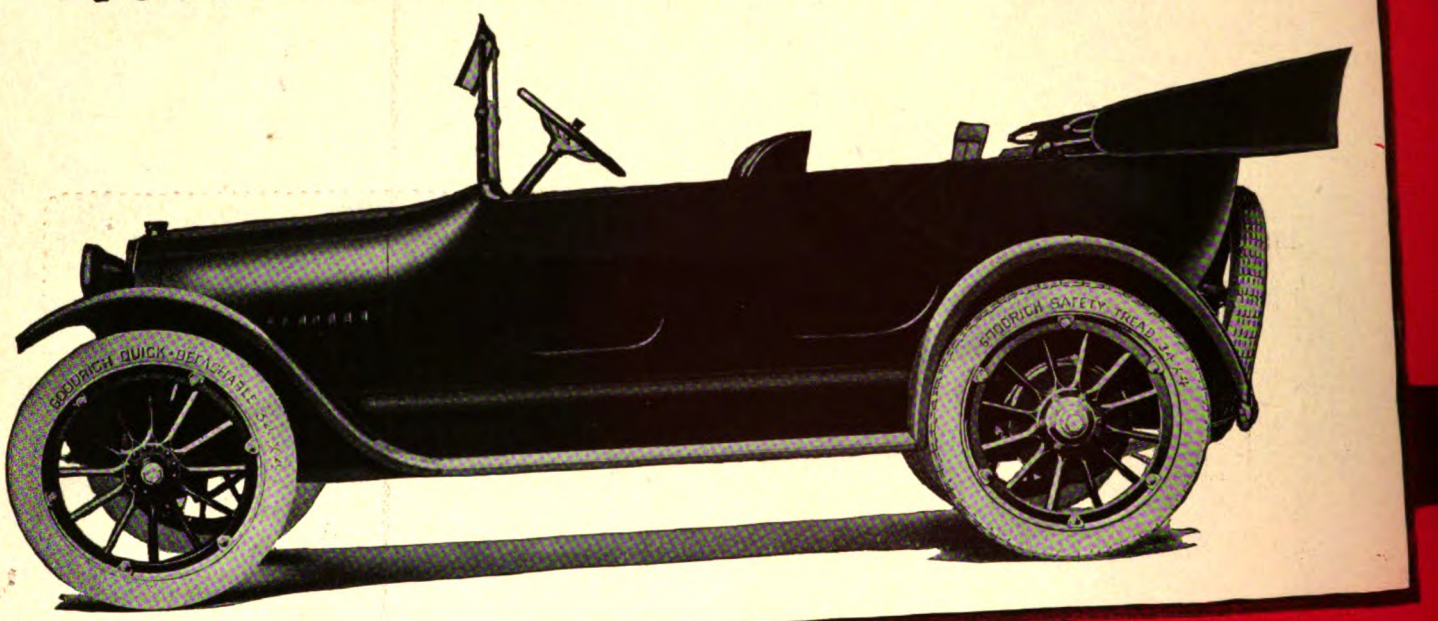
Over 4500 dealers now making money selling Studebaker cars. Merchants all over the country are dropping other lines to become Studebaker dealers, and the same opportunity is offered to other dealers and merchants. Write for further information.

STUDEBAKER

South Bend, Ind. **Detroit, Mich.** **Walkerville, Ont.**

Address all correspondence to Detroit

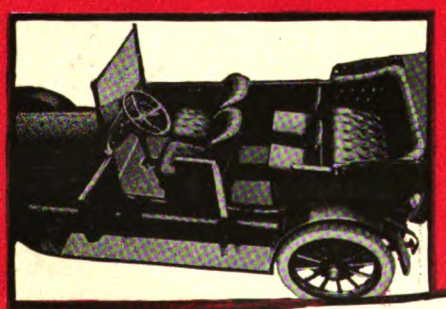
FOUR—40 horse-power—7 passenger—$845

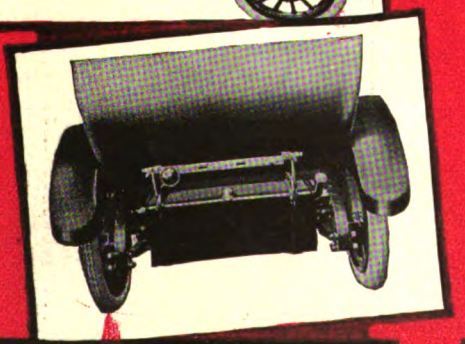


Imagine the selling opportunities a Dealer has with a car like this!

Last year, this Studebaker 4-cylinder car at $885 was the sensational VALUE of the season. This year, the price has been REDUCED to $845—the same car with several added features.

Think what it means to be associated with a manufacturer whose financial resources and unexcelled manufacturing organization makes it possible to produce a car of such quality to sell at $845.



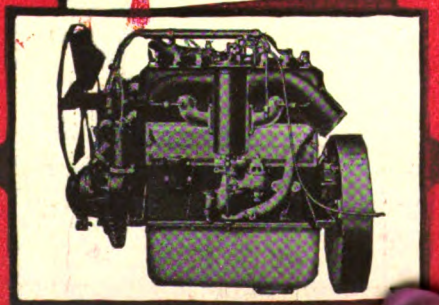


This SERIES 17 FOUR has the same FORTY horse power motor that made it the POWER Car of last season. It has the same SEVEN-passenger capacity. It has the same grace of line and luxury of finish—the same full equipment and the same high quality throughout.

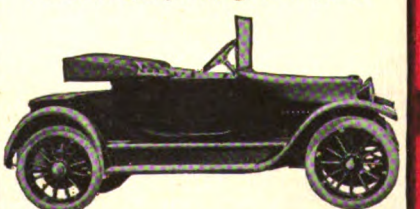
The gas tank has been moved to the rear of the car, thus gaining much more room for the driver. We have adopted the design of one of Europe's most expensive cars for the front seats—DIVIDED them—made them adjustable so that they can be moved to fit the passenger's desires.

We have gained more room in the tonneau. We have used longer springs of extra resiliency for the upholstery, and of course, the SAME high-grade, hand-buffed, semi-glazed leather. We have rearranged the instruments on the dash, making them even more convenient and lighted them by a new, indirect system of illumination.

We have redesigned the windshield, overlapping the plates to give complete protection at all times. The fenders are deeper and richer.

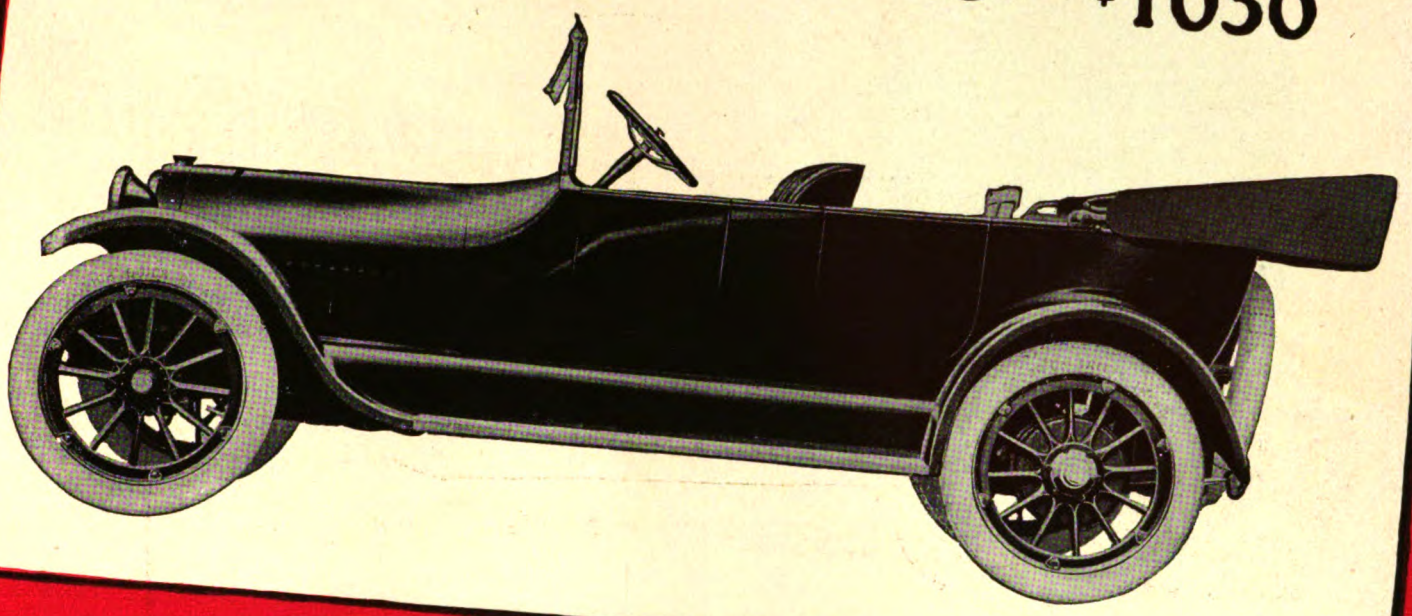


Roadster, 3 passenger - $825



Landau, 3 passenger - $1145

SIX — 50 horse-power — 7 passenger — $1050



—and this SIX at $1050: Think of its possibilities in your territory!

Last year it was the sensation of the season—the ONLY SEVEN-passenger, 6-cylinder car with a 3⅞-inch bore x 5-inch stroke, FIFTY horse power motor ever offered in America or Europe for less than $1450.

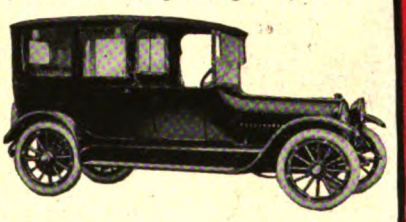
It was $400 ahead of any other SIX that began to rival it in POWER, size or quality. And it swept the country. It was THE value of the year.

This year it has the SAME powerful motor, the SAME seven-passenger capacity and it costs the SAME price—$1050 —in spite of the greatly increased cost of raw materials.

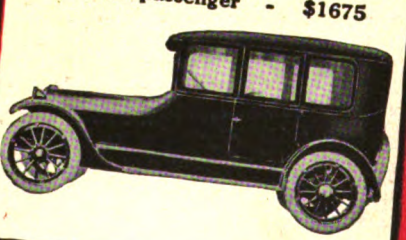
This car also has added features such as—gasoline tank removed to the rear—adjustable, DIVIDED front seats—new overlapping windshield—new arrangement of instruments on dash with indirect lighting system—deeper fenders, etc.

Think of the opportunities such a car offers!

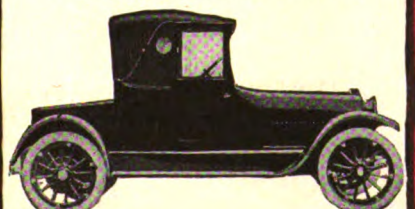
Limousine, 7 passenger $2500



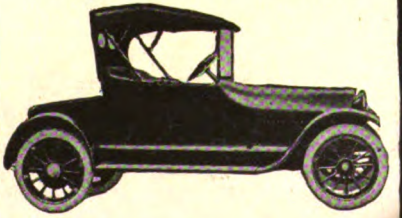
Sedan, 7 passenger - $1675



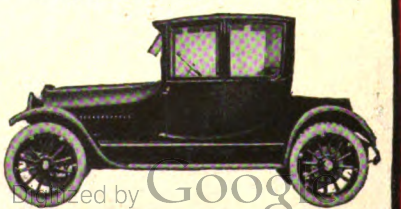
Landau, 3 passenger - $1350



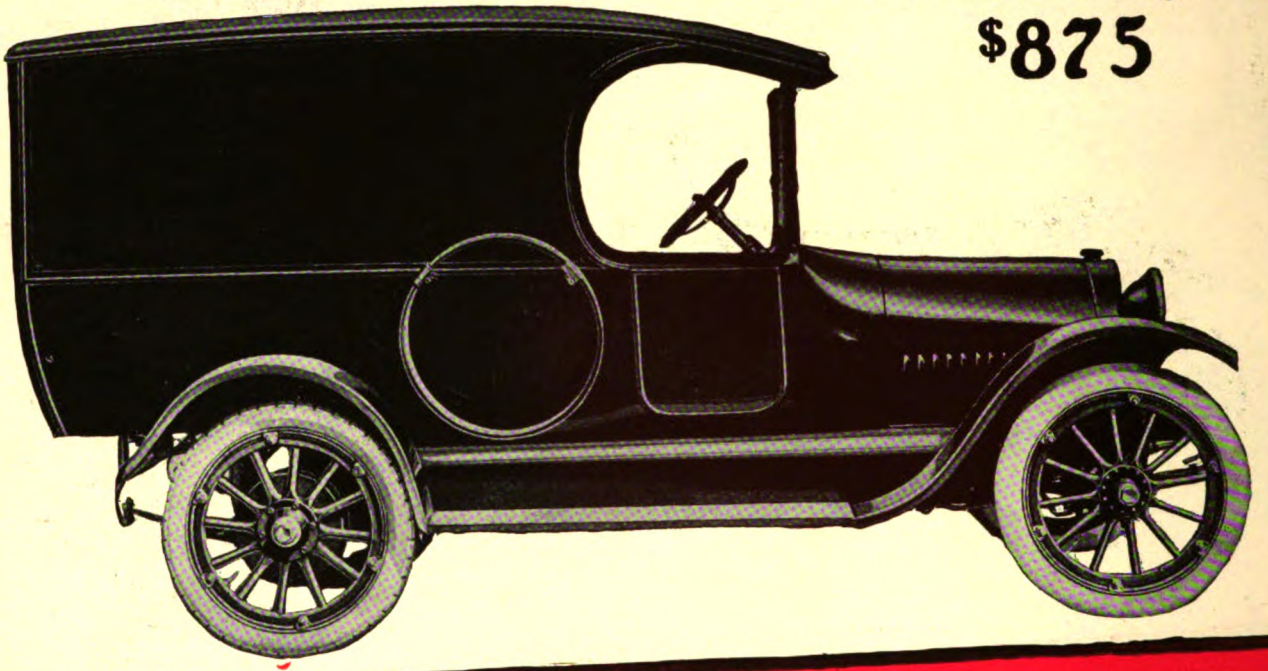
Roadster, 3 passenger $1025



Coupe, 4 passenger - $1600



Panel Delivery Car
$875



And now a COMPLETE Line of Commercial Cars that offers one of the most amazing opportunities of the industry to the progressive dealer

It is impossible to overestimate the opportunities that the Studebaker SERIES 17 line of Commercial Cars offers to the progressive dealer. With national increase in the use of motor vehicles for retail delivery, and the innumerable other commercial purposes, the field is widening daily. And the surface has just been scratched. All the commercial cars now in use do not represent 1% of the possibilities that lie before the men who get into this side of the industry early.

Studebaker offers a remarkable opportunity. With its 64 years' experience in manufacturing delivery vehicles of every nature, in studying commercial vehicle problems—and with its GREAT experience of manufacturing more than 207,000 motor pleasure vehicles, Studebaker offers a series of cars that are RIGHT both from the user's needs and from the mechanical side.

This line comprises 6 models—3 of the half-ton size and 3 new models of ton capacity. Already the half-ton vehicles have won a national popularity. There are more than 20,000 of them in daily use the country over. And not only have they proved up in use, but they offer the biggest dollar-for-dollar VALUES in the market.

The Panel Delivery Car at $875, for instance, is the only car of its price that has a FORTY h.p. motor, fore doors, electric lights, electric starter. It is the only car at its price combining dome light, gas and oil indicators, leather upholstery, heavily braced crown fenders and pleasure car finish.

It is the handsomest car of its kind on the streets—gives absolute COMFORT to the driver—FULL loading capacity—and is built as Studebaker knows a delivery car must be built to give SERVICE. It is not a pleasure car adapted for commercial use.

This is typical of the VALUE that the other cars in the Commercial series offer. No progressive Dealer who is seeking to widen and fortify his business can overlook the opportunity this line offers.

And we urge every dealer to write at once for complete information.

Bus, 16 passenger, - $1400

$50,000
Already Subscribed for New Zealand Agency

Mr. H. L. Rogers has arrived in New York for the purpose of obtaining Automobile and Tire Agencies for New Zealand. The house which Mr. Rogers represents has been established in the Motor Business for *20 years.* Success so far obtained has prompted the stockholders to subscribe a further $50,000 for pushing the sales of automobiles. Manufacturers who are looking for export business are invited to communicate with Mr. Rogers, care of Manhattan Hotel, 42nd Street, New York City.

Seriously

Here is a real business opportunity, requiring an investment of less than 10% of the business transacted during the last fiscal year. Our business (car distributors) is located in one of the most important cities in New Jersey. Average business per year for the last two years over $185,000.00. Present tangible assets $15,000.00 to $20,000.00. All current bills paid and no outstanding indebtedness. Our business affairs will stand the very closest investigation, either personally or through Dun and Bradstreet's. The investment is required for the purpose of taking advantage of present local business opportunities, and the partnership can be active or silent. This announcement covers, as stated, a genuine opportunity. For further particulars address Box O321, care of the Automobile.

STODDARD DAYTON

REPAIR PARTS

Don't listen to the new car salesman, when he tells you, confidentially, that you had better get rid of your old car because you will not be able to get parts; his object is to sell you a new car. We carry a full line of parts and have the patterns and forgings, tools and dies for the reproduction of them. We have maintained a repair shop for the last ten years for these cars, and will continue it as long as there are any to be repaired. If you intend to keep your car get your information from us.

DAYTON AUTO REPAIR CO.
351-55 West 52d St. New York City

We employ expert mechanics and guarantee all work. Gears and Parts Manufactured. Fifteen years' experience.

Perfection Auto Repair Works
314 14th St. Buffalo, N. Y.

Piston Slap

or

"Knock"

Caused by

Cylinders Being Worn Oval

THE RESULT { **Loss of Power** / **Excessive Smoke**

increases the consumption of gas and oil. You are also liable to arrest in some cases owing to the strict enforcement of City Ordinances against smoking cars.

AVOID ALL THIS BY HAVING YOUR CYLINDERS REGROUND

and fitted with our pistons and individually cast HEAT TREATED piston rings. Over 20 years' practical experience in engine building and repairing is a positive guarantee and assurance that we are well equipped to turn out satisfactory work at all times.

When asking for prices please give the following information:

1—Name and Model of Car or Engine.
2—Number of Cylinders to be Ground.
3—Bore and Stroke of Engine.

DON'T FORGET—ALL WORK POSITIVELY GUARANTEED

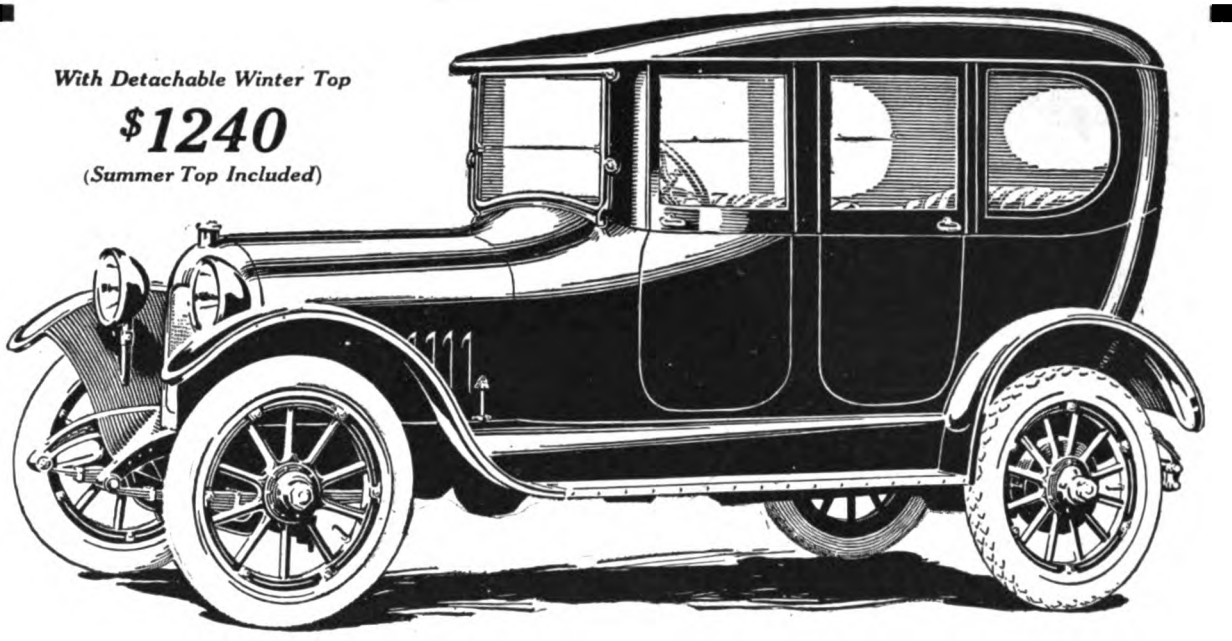
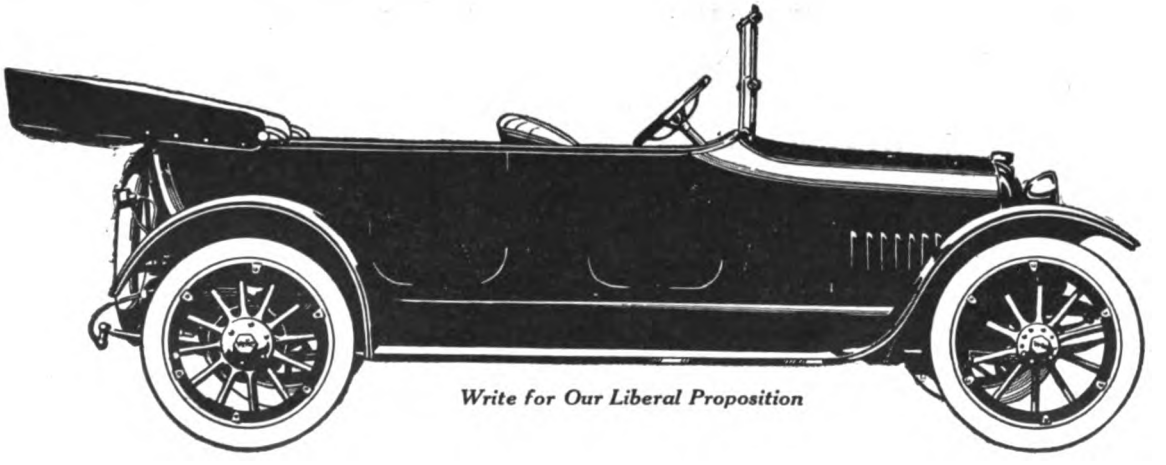
Announcement of 1916 Velie Line



Electric Lighted—Drop Windows—Whipcord Trimmed
Perfect Workmanship—Wire Wheels on Any Model $70 Extra

VELIE SIX Touring Car with Detachable winter top gives all the luxury of the closed car at the price of the ordinary open car. Velie Coupe Type on the same chassis at $1750, combines the town car style and distinction with abundant power for the long tour.

These two Velie enclosed types give the Velie dealer dominating values for the immediate winter market while the Velie Six touring car at $1065 and Velie Roadster at $1045 complete the line at prices not matched by such construction, features and style.

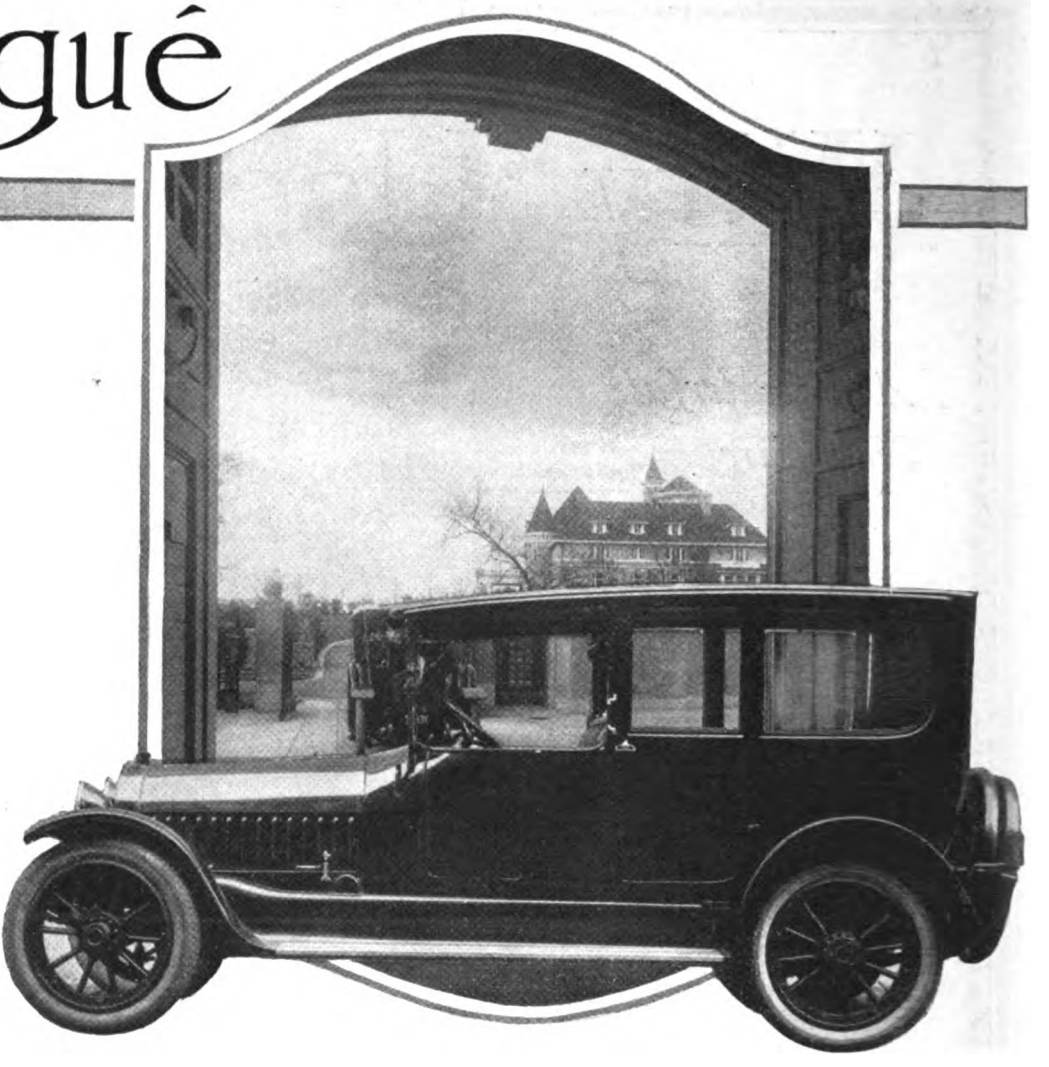


Write for Our Liberal Proposition

Velie Motor Vehicle Co., 114 Velie Place, Moline, Ill.

Velie Six $1065

Distingué



A man's satisfaction with his motoring equipment depends as much upon the architecture and workmanship of its body as upon the mechanical excellence of its chassis.

Recognizing this, many of the more successful distributors of American built cars have working agreements with us to design and build special bodies for their customers whose ideas call for something better than manufacturers' stock body examples.

Certain of the more progressive car manufacturers, taking heed of their distributors' success in handling the equipment of their chassis with custom-built bodies, now contract with us to design and build a certain percentage of their bodies.

Read what this Taxi Company says

Ever been in Saginaw, Mich.?

If so, you know it's a pretty tough place on automobile springs—especially in a public taxicab service.

Here's what the Letts Auto & Taxi Co., of Saginaw say regarding Tuthill Titanic Springs:

"Up to date we have not had one broken spring or leaf and the first Tuthill Springs we purchased about two years ago are still in use and apparently are as good as ever.

"On the other hand, many new springs furnished as stock equipment have broken at the hole in the center and we have had to replace them with Tuthill Springs within two or three months."

This is only one of many letters we receive from satisfied users.

Insist on Tuthill Titanics on your new car and for replacements on your old car.

No weakening center hole or center nib, which weakens practically as much as center hole.

See the Tuthill Exhibit at the Chicago Auto Show

COLISEUM ANNEX, 2nd Floor, Booths 156 and 157

TUTHILL SPRING COMPANY

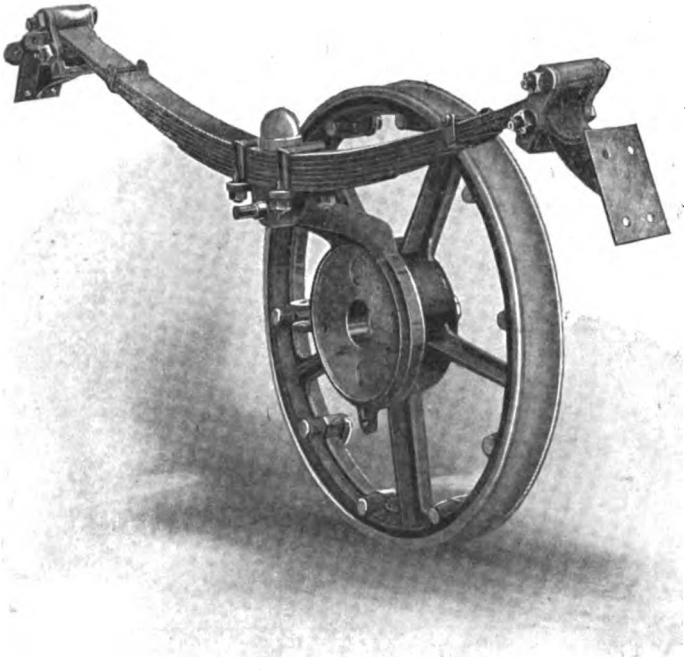
Tuthill Titanics are guaranteed forever against center breakage

Tuthill "Titanics" can be adapted easily to any axle construction and quickly mounted without any extra expense.

At the New York Automobile Show

Space D-169

there will be an exhibit that is going to have a far-reaching effect on Trucking and Delivery Car Service as at present constituted. A simple principle, applied for the first time, will so increase the carrying capacity of the unusually strong and flexible Ford Chassis that it will handle loads up to



Patented August 24th, 1915

ONE TON

with the same ease and at practically the same expense as it does its normal, limited load. This result is obtained by equipping any Ford Chassis with the

"OLSON" CONVERTING UNIT

the cost of which is only **$65.00** F.O.B. Detroit, Mich.

The "OLSON" CONVERTING UNIT makes the Ford rear axle FULL FLOATING. The load weight is carried by the "OLSON" Steel Truck Wheel entirely, being centered on a set of auxiliary Body Springs that pivot on a Spring-Pin set into the Bracket of a Steel Hub Housing, carrying high efficiency Roller Bearings and fitting over and onto Hub of Wheel. A set of auxiliary Radius Rods neutralize load strain and side sway, and a special Truss Rod keeps Hub Housings in perfect alignment. Wheels are made for either pressed-on solid Tires or with demountable Rim for pneumatic Tires.

In all around efficiency, in first cost and in service expense, the "OLSON" equipped Ford stands without a rival, and business men in all lines will be in position to greatly reduce an item of expense that often is a serious drain on their revenue.

Exclusive sales rights will be given to some progressive business man in each locality and this proposition should appeal especially to Ford dealers, everywhere.

BESSEMER MOTOR TRUCK COMPANY

GROVE CITY, PA.

MASTER GARAGE PUMP

for inflating automobile tires

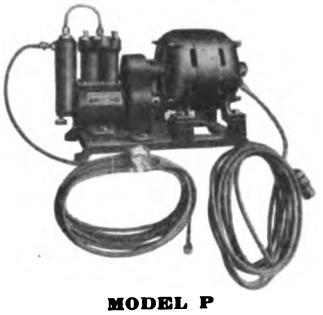
THE Master Garage Pump is just as necessary for an automobile owner or garage proprietor as is the self-starter, electric lights, magneto, Klaxon horn and other 1915 necessities and improvements.

Tires should be *inflated gradually—under steady pressure*—up to the required specified pressure—*gradually* filled with an *even flow of air, not in jerks,* throwing a series of undue strains on the fabric of the casing.

The Master Tire Pump will positively and properly inflate tires up to the specified pressure in the shortest possible time.

No storage tank is required. We have perfected a pump from which every vestige of pulsation has been eliminated in the delivery of air. The steady, even flow of air that is absolutely necessary for the proper inflation of automobile tires is an accomplished fact with the Master.

No other garage pump can muster so many points of excellence. Every piece of material entering into its construction is the finest obtainable. It is mechanically head and shoulders above any other pump on the market, with an unequaled record for efficiency.



MODEL P

For the private garage owner we recommend **Model P.** This is a wonderfully efficient pump. Can be furnished with or without truck. It may be mounted on a shelf, or in an out of the way place in the garage as a **stationary pump. Mounted on a truck** it is easily moved from place to place in the garage, and owners of three or four cars find it more convenient to use in this way. An extra $5.00 charge is made for mounting this equipment on a neat metal truck. Model P Pump, both stationary and mounted on a truck, has proved itself a great favorite with proprietors of small public garages catering to from twelve to twenty cars. It is furnished as shown—a two cylinder pump, mounted on a frame and driven by a General Electric motor. Twenty feet of the best reinforced rubber air hose, with pressure gauge attached and twenty feet of lamp cord with plug. The Master Model P is the most powerful equipment of its size on the market today and will inflate a 37x5 tire to 90 lbs. pressure in less than 3 minutes.

Model P—for private garages or small public garages; stationary, electric-driven, 2-cylinder, ¼ H.P., G.E. Motor. Complete with equipment, ready for use.
Regular A. C. Motor—$60 F.O.B.
Regular D. C. Motor—$55 Hartford

Model P—on truck; same specifications and power as Model P stationary.
Regular A. C. Motor—$65 F.O.B.
Regular D. C. Motor—$60 Hartford

The Pistons are extra long and are of special steel, carefully hardened and ground to exact size and lapped into the cylinders. Rubber disintegrates rapidly under the influence of oil. *It is absolutely impossible for any oil to get into the delicate inner tubes of the tires from the Master Garage Pump.*

No rubber or leather packing rings or piston rings of any kind are used. The pistons fit so tightly into the cylinders that there is no need of them and no danger of oil working through, but as an added precaution, part of the equipment of every Master Pump is a small expansion chamber which collects any possible trace of impurities—*only pure air is delivered to the tires.*

There is a Master model designed for every garage requirement. Hundreds of Master Garage Pumps are in service today, rendering efficient service out of all proportion to their small cost.

The Master Garage Pump can be connected in a moment's time to any electric light circuit. It requires only the switching of an electric button to start a steady stream of pure, clean air for inflating tires.

Free 10-Day Trial—Liberal Guarantee

We ask you to "Use the Master Garage Pump for ten days. If you do not want to keep it at the end of that time your money will be promptly refunded," and if you do keep it, as you surely will after you have once tried it—"we guarantee Master Garage Pumps for one year against defects of material or workmanship. With ordinary care and usage they should last ten years." This is the offer and guarantee of one of the largest and best known companies in the manufacturing field—with 50 years' successful manufacturing experience and prestige.

You can try out a Master Pump with the understanding that, if you are not entirely satisfied, you may return it and have your money refunded. Once you have tried it you will realise how much you need it. Take advantage of our offer today.

N. B.—All pumps are priced F. O. B. Hartford. We do not prepay shipping charges.

Our stock motors are for 110 volt direct current and 110 volt single phase, 60 cycle, alternating current, but where necessary, we can furnish motors for 220 volt direct current, 110 volt 25 to 40 cycle alternating current, or 220 volt, 25, 40 or 60 cycle alternating current. *State current conditions when ordering.*

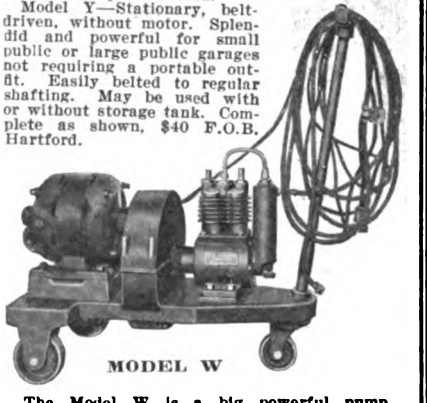
Liberal Discount to Agents

Hartford Machine Screw Co.
482 Capitol Ave., Hartford, Conn.

MODEL Y

Model Y consists of the same pump as is used in Model W but instead of a motor it has a flywheel pulley attached so that it may be used in garages and machine shops with air requirements which already have a line of shafting installed and an individual power unit. This machine was brought out to meet the demand from certain garages and shops not desiring to incur the expense of an extra motor. No more efficient or serviceable machine has ever been put on the market at the remarkably low price at which this Model Y Master Pump is offered.

Model Y—Stationary, belt-driven, without motor. Splendid and powerful for small public or large public garages not requiring a portable outfit. Easily belted to regular shafting. May be used with or without storage tank. Complete as shown, $40 F.O.B. Hartford.



MODEL W

The Model W is a big powerful pump especially designed for large public garages catering to a large number of cars. This can be furnished either with or without truck but is most popular mounted on the truck. The ease of transporting it from place to place in the garage enables the garage proprietor to facilitate his free air service. We have testimonials from garage owners all over the country lauding the merits of this wonderful outfit. It is so sturdy and so heavily constructed that it will stand any amount of abusive treatment to which it will be subjected in the average public garage without fear of injury. Efficient always, it has a record of inflating a 37x5 tire, from flat to 90 lbs. pressure in less than a minute and a half. Public garage owners installing an outfit of this kind will be in a position to render a service to their customers out of all proportion to the cost of the installation. As with other Master Models no storage tank is required, although it has been found practicable in many instances to use this pump in connection with a compressed air tank under which condition it has proven itself amply efficient. A particularly noticeable feature of the pumps is the fact that they are practically noiseless. Rawhide gears are used to connect the motors to the pump.

Model W—2 cylinder, electric-driven, ½ H.P., G.E. Motor. With complete equipment ready for use.
Regular A. C. Motor—$105 F.O.B.
Regular D. C. Motor—$100 Hartford

One of the new **Rutenber** *additions at Marion, Indiana, being rushed to completion. The constantly growing need for larger quarters has made it necessary to occupy the two lower floors before the upper story was finished.*

RUTENBER

Increasing with Such Giant Strides that

Continuously for over two years building operations have been going ahead at top speed that **Rutenber** Output might catch up with **Rutenber** Demand. During this time a 100 per cent. increase in factory space has been made.

An ever increasing number of America's leading car manufacturers throughout this period have been equipping their product with **Rutenber** Motors. A decidedly marked and steady growth in favor for the popular **Rutenber** among discriminating car owners has also made its effect felt.

What would have prevented most of the auto mishaps you know of?

Wouldn't good brake lining have done it?

Careful drivers know, or they are fast learning, the false economy of friction-shy brake lining.

They are learning the advantage of Thermoid 100% brake lining—an advantage that may any time mean the difference between a close shave and a crumpled car—a narrow miss or a crushed body.

Thermoid HYDRAULIC COMPRESSED Brake Lining-100%

Brake lining that is not 100% is like a heart failure. A sudden shock—a Big Emergency—may mean death.

Thermoid Brake Lining has 100% gripping and holding power even when it is worn paper thin.

That means that lined with Thermoid the brakes will hold, not only when the car is just being stopped but when it must stop quick or hit something.

Thermoid wears because it is cured under hydraulic compression into a solid substance of uniform density. It contains 50% more material foot for foot than do other kinds. Watch the brakes—remember that without a lining they are not brakes at all. Consider, too, how much better it is to see they are lined with Thermoid Brake Lining than to have a finely equipped motor crumpled into junk in an instant, or to have to race to a hospital with a child or adult that would not have been hit if the brakes had held.

Cannot be burned out nor affected by oil, water, gasoline or dirt.

Our Guarantee: Thermoid will make good or we will

to Car Owners Reduced

Today, after scarcely more than a year, the Stewart Vacuum Gasoline System is regular standard equipment by over 50 per cent of all car manufacturers and has been installed by thousands of motorists everywhere to bring their old and new cars up-to-date.

On Motor-Driven Tire Pumps we were again the pioneers in reducing the price necessary to pay for a high-grade Motor-Driven Tire Pump

Motor-Driven Tire Pump prices ranged from $20 up.

We made the price on the high-grade Stewart Motor-Driven Tire Pump $15 at the start.

To be fair to the car owner we again took the first losses.

Now we have reduced the price of the Stewart Motor-Driven Tire Pump to $12

It is the fundamental purpose and policy of the Stewart Institution first to make the best product in every line. No prices are ever aimed at in advance. Every department is instructed to build the best. No limitation is placed upon cost in design or construction to accomplish the purpose that each Stewart Product is built for.

The price is finally arrived at on a basis fair to the car owner from the start when the product is marketed.

Of course this policy would not be possible to institutions of less buying power, smaller facilities for manufacturing or narrow marketing facilities.

It has been upon these basic principles that the Stewart Institution has grown so tremendously within the last few years, so that it is today the largest manufacturer of high-grade automobile accessories in the world.

There has never been a time like right now in the face of high "war prices," when there has been so much inducement and temptation with manufacturers to skimp on quality.

Right now, steel is nearly impossible to get even at advance prices. Brass prices have gone up. Aluminum prices have taken a big jump. Die castings have sky rocketed to about triple normal figures.

Yet Stewart prices have been reduced. We are not asking our patrons *higher* prices as many concerns have been forced to do.

We are able to maintain and continue to maintain these low prices on all Stewart Products, because of the loyalty of 1,700,000 motorists of America and 95 per cent of all car manufacturers who regularly equip their cars with Stewart Products.

Such a policy always has been and always will be maintained by the Stewart Institution and supported by car owners and car manufacturers of America.

Speedometer Corporation
U. S. A.

Don't let any dealer sell you anything different than Stewart Products or what he may call "just as good" as Stewart Products.

It is not possible to make higher grade better products than Stewart Products at any price and Stewart Products are always lowest in price, quality considered.

When You Visit the New York Show Don't Fail to Examine

The Perfection Heater

PATENTED

You'll find our exhibit the Third Floor, Booth C-78. Let our representative show you how simply — how inexpensively —it will warm any car in the coldest weather. Ask him to explain why there is no odor, no noise, no loss of engine power and

—no operating expense

The Heater uses merely a small fraction of the exhaust heat to warm a car. A slight movement of the foot opens and closes the register and regulates the heat perfectly.

The Perfection Heater is being operated with great success by hundreds of car owners. Many more are demanding it.

Every motorist in your territory is a possible prospect. For we build Perfection Heaters in three styles, one of which will fit any car.

The Perfection Heater is a *big winter* seller for dealers and garage men.

To them it means real business during the winter months.

And not only that—they make money on installation work as well as on sales of the Heater itself.

Don't fail to see our exhibit.

It will surely interest you.

THE NEW STEWART THOUSAND POUND TRUCK

Chassis
$695
Complete With Body
$750

Here is the first real 1000 pound delivery truck produced at a sensational price. Another addition to the Stewart line of quality trucks—giving to the dealer the fastest selling line of trucks ever offered by a responsible organization.

Demands for delivery service prove this—that the light delivery truck is the truck of today—and the truck of the future. More light delivery trucks were sold last year than all other types combined.

And this new 1000 pound truck has all the Stewart quality that has made the Stewart famous throughout the country in over 90 different lines of business. Read over the specifications and you will quickly see that this truck has the stamina and power to meet the gruelling demands of motor delivery service.

"Made by Stewart" is your guarantee that this 1000 pound truck is built right. This new truck is the result of experience in motor truck building—knowing the delivery requirements of motor truck buyers. The price is made possible by quantity production.

BIGGER DEALER OPPORTUNITY

With this new 1000 pound Stewart truck at $695 and the three-quarter ton at $1290, and 1¼ ton at $1390, the Stewart line offers a rare opportunity to dealers. Never before so great dollar for dollar value in truckdom—three popular styles that sell fast.

We have some open territory. To attract live dealers we are offering a special inducement in the form of more liberal commissions. Write today for this Special Dealers' Proposition. It will open the way to a profitable motor truck business for you.

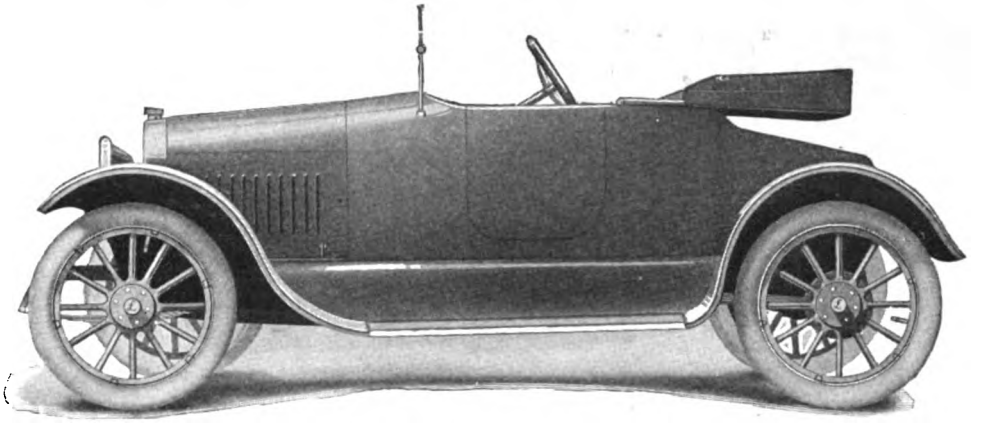
The Sterling—New York

assures unusual profits to the agent who understands the commercial value of a moderate priced car of elegant design, appealing to discriminating buyers, with grace of line and powerful motor of low gas consumption.



The Sterling—New York Roadster 1916

SPECIFICATIONS

MOTOR—Sterling 4-cylinder, water cooled, 3 x 4½, overhead valves, unit power plant, selective sliding gear transmission, 3 speeds forward and reverse, thermo-syphon cooling, cylinders cast en bloc, detachable heads.
LUBRICATION — Self-contained, constant level, plunger pump and splash, individual oil pocket for each connecting rod dipper. Sight feed on dash.
CARBURETOR —Zenith, supplied by gravity from tank in cowl, filler cap on instrument board.
IGNITION—Unisparker system with spark advance.
CLUTCH —Large leather-faced cone, with springs under leather for smooth engagement.
DRIVE —Shaft through pinion and ring gear to rear axle.
REAR AXLE —Semi-floating, high grade materials and bearings throughout.
FRONT AXLE —Drop forged. I-beam with integral yokes; tie rod in rear of axle.
BRAKES —Two on rear wheel hubs, Raybestos lined.
WHEELS —Wood, artillery type, with large cup and ball bearing, demountable rims.
TIRES —Clincher, 30 x 3½ in.
STEERING GEAR —Irreversible split nut type, adjustable, 16-in. steering wheel, LEFT DRIVE.
CONTROL —Gear change lever conveniently located in center of body. Foot accelerator. Hand throttle on steering wheel. Left pedal for clutch, right pedal for service brake. Foot-operated emergency brake. CENTER CONTROL.
BODY Streamline, with elevated cowl, wide doors, ample leg room, tufted upholstery.
CROWN FENDERS
FRAME —Pressed steel channel section, extra strong.
SPRINGS —High grade spring steel, double heat treated. Front, semi-elliptic; rear, full cantilever; no side sway.
WHEEL BASE—102 inches.
TREAD—56 inches (standard).
FINISH—Blue-black or grey.
STANDARD EQUIPMENT — Real one-man-style mohair top, side curtains and dust cover; rain-vision ventilating windshield; electric lights, tail light and combination cowl and trouble light; electric or hand-operated horn; tire repair kit; set of tools and jack; speedometer. Also—

Two unit Auto lite electric starting and lighting system, equipped with Eclipse-Bendix drive, battery included.

Dealers, Look Into This Car!

Here is a car that will draw from every class of buyers in your territory. The owners of big cars will need it as an auxiliary. The family of moderate means will find it a social help. The salesman, the doctor, all who must cover territory in their business will find it not only an economical means of transportation but an effective maintainer of prestige.

Its sleek, snappy body lines, with the dull-gray finish, suggest a high-priced European design.

The ratio of horsepower to car weight is very high, insuring a responsiveness and quick pickup seldom found in any car regardless of size or price.

SPECIFICATIONS

Motor.—25-30 hp., 3¼ in. bore by 5 in. stroke, 4-cylinder cast en bloc with removable water cooled head. Two bearing crankshaft of liberal proportions made of heat-treated chrome-nickel steel.

Transmission.—Selective sliding gear type, three speeds forward and one reverse. Gears, high carbon steel triple heat treated. Transmission case bolts to rear side of clutch bell on motor case, forming a unit power plant which is supported at three points.

Clutch.—Disc type of special design.

Lubrication.—By plunger pump driven by the cam shaft and accessible located on the side of the motor. All moving parts are constantly covered with a spray of oil.

Ignition.—By high tension, waterproof, oil-proof and dust-proof magneto.

Starting and Lighting.—Six volt, 80 ampere, single unit system with storage battery.

Carburetor.—Is a special design developed especially for this motor, designed to secure great pulling power at low speeds, quick pick-up and extreme fuel efficiency at high speeds.

Cooling.—Is by the tested and proven thermo-siphon system, with unusually large radiator capacity.

Gasoline Supply.—Is by gravity feed from 13 gal. tank carried in cowl.

Control.—The car is driven from the left side, with control levers in the center mounted directly on transmission case. Gear shift lever has positive locks for each of the four gear positions. Spark and throttle levers are mounted directly on the steering wheel.

Instrument Board.—Of highly finished natural wood, all instruments being mounted flush. Directly under the driver's eye are the Standard 60-mile speedometer with total and trip mileage dials driven from transmission. Oil gage magneto and light switches, two ammeters, gasoline filler cap and gasoline indicator.

Wheelbase.—108 in. Tread 56 in.

Rear Axle is of the full floating type with low carbon case and hardened steel differential gears, pinion and bevel ring. Ball bearings are used throughout.

Springs.—Rear: 48 in. cantilever type so slung as to minimize all road shocks.
Front: 42 in. long, of chrome vanadium steel.

Steering gear is irreversible, of the worm and sector type, and operated by a 17-in. wheel so positioned as to afford maximum comfort for the driver.

Frame.—An original design in high carbon steel of a type found only in high-priced cars.

Wheels.—Houk wire wheels with standard QD rims. Extra wheel and tire supplied with car.

Tires.—30 by 3½ in. all around. Plain tread front, and non-skid rear.

Body.—3-passenger roadster type of pressed steel, finished with a special dull surface, and luxuriously upholstered in process leather. Seats stuffed with natural curled hair.

Fenders.—An attractive design in pressed steel. They are joined by linoleum covered, aluminum bound running boards.

Windshield.—Clear vision, rain vision, ventilating type—a single piece of French bevel plate glass.

Top.—One man type with dust envelope.

Lamps.—Electric. Two headlights with dimmers; tail light and dash light.

Equipment.—Vibrating horn, tool kit and tire repair outfit. Wheel carrier with extra wheel and tire.

Price.—$855 f.o.b. factory.

You'll See Them Everywhere in Chicago

Flecking the boulevards and downtown thoroughfares with brilliant patches of color—dominating Chicago's 50,000 other motor cars as a king's coach would dominate a procession of one-horse shays.

And when you see them—Chicago's famous Yellow Cabs, 260 strong—and when you ride in them—as everyone who comes to Chicago does—note the master workmanship, inside and out, of the RACINE Bodies which adorn their sturdy chassis.

Due to the terrific grief a cab body must stand in comparison to a similar body in private service, extraordinary attention must be given every detail entering into the construction and manner of supporting and bracing the various items subject to strain.

Duplication of every part must be worked out so that in the event of accident new parts can be replaced with a minimum amount of labor and time.

The working out of these items is not a matter of a hurried set of drawings and building of these bodies but the result of a great number of repeated attempts being made until the height of perfection is reached in every detail, realizing that bodies put to this service are only as good as their weakest part. The elimination of the weakest part has been our object.

We Are Specialists with Over 10 Years' Experience in the Manufacture of—

COUPES	LIMOUSINES	VICTORIAS
COUPELETS	SEDANS	PALANQUINS
LANDAUS	BERLINES	CABRIOLETS
LANDAULETS	BROUGHAMS	TAXICAB BODIES

—and if you are interested in the increasingly popular Demountable Top

it will interest you to know that RACINE Demountable Tops set the standard by which all other similar tops are gauged.

Demountable Tops must be made by a concern with a world of closed body experience, since every refinement and all the close work requisite to perfection in closed body manufacture is doubly imperative to satisfactory demountable top work. The RACINE Manufacturing Company has had this experience—**perhaps more of it than any other body builder in this country.**

Separate from its touring body shop it operates a closed body shop under the watchful supervision of closed body and demountable top experts, among which are numbered some of the most famous designers of Europe.

In conjunction with both shops is conducted a large painting and trimming department with facilities for turning out in completed form any type of high-grade top work.

Regardless of what your preconceived ideas of closed body or demountable top perfection may be, we have a price and quality proposition which will surely interest you.

While at the Chicago Show visit our factory at Racine if you can, or let us know where you are stopping and one of our representatives will get in touch with you.

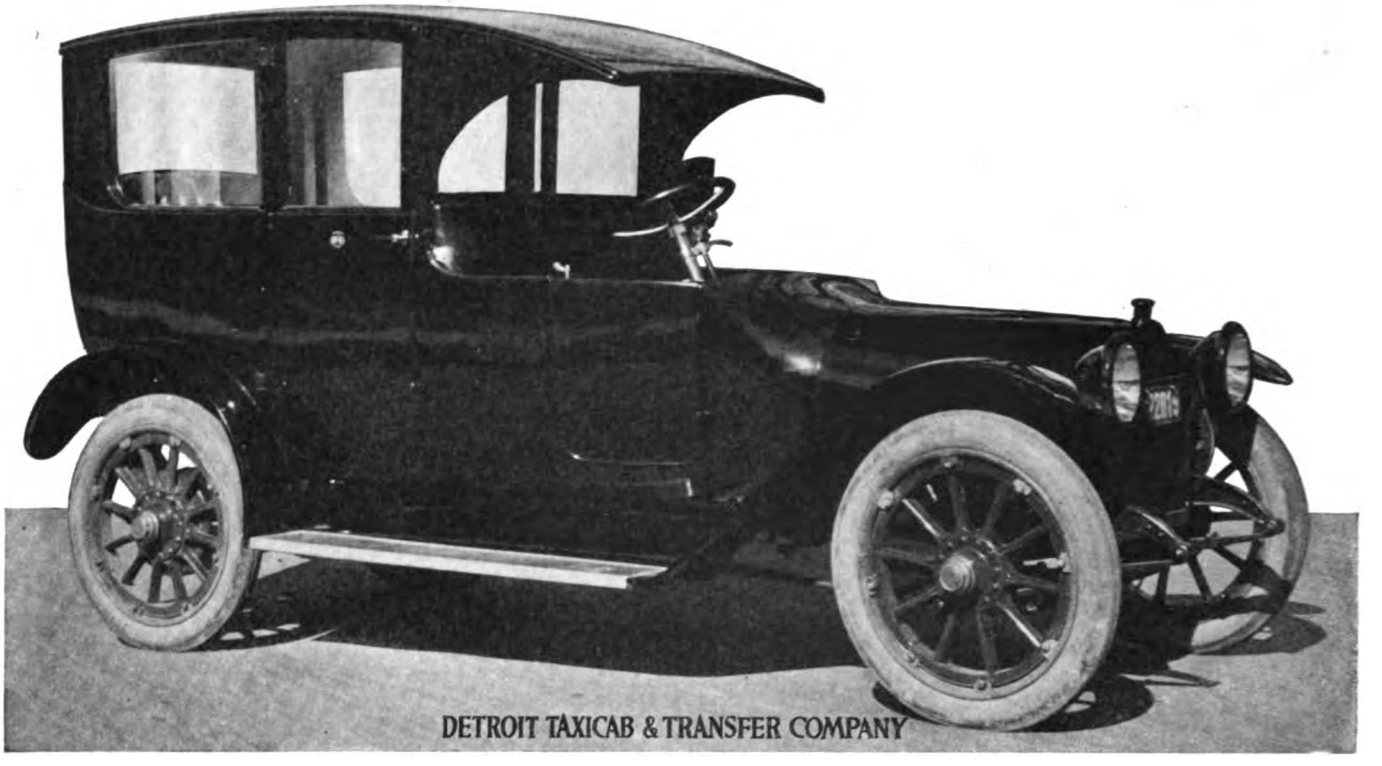
NATIONAL RUBBER CO. **Pottstown, Penna.**

MR. DEALER: Here is your chance to get in on the ground floor of a good tire proposition. You can get better discounts and more territory NOW than you can later on. Real built-in merit plus good aggressive advertising will soon make the exclusive agency for National "REDWALL" Tires and National "SPECIAL" Tubes a most valuable asset—

BUT THE TIME TO ACT IS *NOW*



Where shall your customers buy Shaler Tourist Vulcanizers?

Your customers know the advantages and reputation of Shaler Vulcanizers because the Shaler is advertised in their favorite general magazines and motor papers.

These customers are ready to buy their Shalers. Every day new prospects are created. If you do not supply your own customers some dealer is going to make a profit on goods that you ought to sell.

We help you sell Shalers. In fact our entire effort is directed to selling Vulcanizers for dealers instead of to dealers.

SHALER

Vulcanizers

Opposite are pictures and descriptions of three of the most popular Shaler Tourist Vulcanizers.

Remember that every motorist ought to carry one of them in his toolbox to use instead of patches. He ought to use them to mend small casing cuts and prevent blowouts. Your reputation for selling good tires will be increased with every customer who cares for his tires with a Shaler because the Shaler will double his mileage.

If you haven't been getting the vulcanizer sales that have been made in your own territory, stop and think whether you have ever let a single customer know that you could supply the Shaler.

Get these sales helps FREE

Nearly all of our advertising appropriation is used to tell motorists of the advantages of Shaler Vulcanizers and to urge them to buy from their dealers. The Shaler is advertised in such magazines as Saturday Evening Post, Collier's, etc. Other vulcanizers are advertised only to dealers. Motorists don't know them.

We furnish circulars, signs and window displays to help you. We finish and pack our product attractively.

Accessory Dealers

You make a good profit on Shaler Vulcanizers—you make a profit on every repair that is made because you sell the repair material to use with it. Send the coupon today and get our proposition to the trade. It means money to you.

COMPLETE CATALOG FREE

Send coupon for a new complete catalog describing each Shaler model in detail. We will also send you our book "Common Sense About Tire Repairs."

SHALER

Vul-Kit $3.50

Fits Any Size Tire

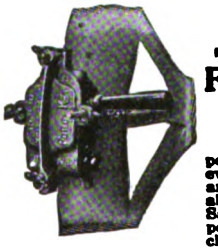
Can be carried in the tool box for emergency repairs to tubes and casings. Does away with patches and cement. Has no exposed blaze. Absolutely safe. Burns gasoline or alcohol—an exclusive Shaler feature. No watching, no regulating; simply fill the cut or puncture with new rubber, clamp on the vulcanizer—fill and light the generator. You can't overcure or undercure a repair. Handle always cool. Anyone can use it. Complete, $3.50.

Model for home garage $12.50

SHALER

Tube-Kit $2.00

Does away with temporary patches for repairing tubes. It takes no more time to repair a tube permanently with a Shaler Tube-Kit than it does to use a make-shift patch. Can be carried in the tool box for roadside repairs or can be used indoors. Has no exposed blaze—is free from soot and smoke and the fuel cannot spill and flare up. Handle is detachable.



SHALER

Ford-Kit $2.75

For Ford Tubes and Casings

This model, designed especially to fit Ford tires, makes every practicable tube repair, and what is much more valuable, mends casing cuts too. Safe, simple, clean. No exposed blaze so can be used close under a fender.

The Advertising "Hit" of the New York Show

Every automobile driver and dealer will be interested in this series of advertisements which "talk sense" from a new viewpoint.

The ad reproduced is one of a series of twelve.

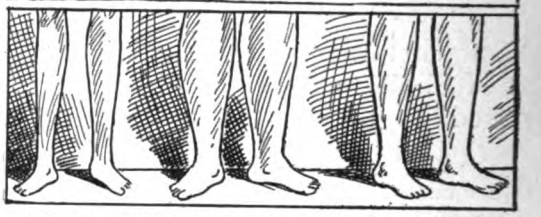
A complete set will be sent to any one interested.

Address:

Publicity Department,
MITCHELL-LEWIS MOTOR CO.
Racine, Wis.

Supposing You Started Out to Buy a Pair of Legs Instead of An Automobile

Have This Thought in Mind When You Go to the Show—Which, of Course, You Will.



In buying your first pair or a new pair of legs, what would be the essentials that you would DEMAND before you buy?

You would want a pair that would take you "there and back" without having to stop for some "tinkering." You would want a pair that would not jar your collarbone loose every time you took a step.

You would want a pair so constructed that you would not have to THINK ABOUT THEM ALL THE TIME. You would want a pair with feet that would do their part without your thoughts going down in your shoes. Your trips—business or pleasure—would not be very enjoyable or EFFICIENT with them down there.

Then—according to individual requirements—you would want a pair of legs that would best meet YOUR needs. They may be shapely, powerful, small, large, silk-stockinged, high-heeled, broad toed, or like a contortionist's. BUT YOU WOULD BUY YOUR LEGS FOR THE SERVICE THAT THEY WOULD RENDER YOU.

Buy an automobile from the same SERVICE viewpoint.

At the automobile show you'll see many styles, kinds, colors, designs. Some will have real points that will appeal to you: many will have just "talking points" that perhaps will not.

At the Mitchell—"THE SIX of '16"—exhibit you'll see what we believe to be a truly wonderful car for ALL AROUND EFFICIENCY. You will not be told that it's hundred per cent perfect. But the fact that its "average" will place it at the head of the list will be demonstrated and PROVEN.

THE SERVICE THAT THE CAR WILL RENDER YOU will be the basis of our demonstration. You'll not just be told what this car has or is—but what it "has" or "is," DOES.

You are not interested very much in the fact that it has a distinctively unique spring suspension—but you are interested in the fact that the Mitchell spring suspension makes it the easiest riding car.

Many other exclusive points of merit and superiority will be shown for *what they do* rather than for what they are.

After you have walked around a bit and seen the other cars—see the Mitchell—see WHAT SERVICE IT WILL GIVE YOU—and you'll buy it.

The truth of this is proven by the thousands of others who were sold on a "show me" basis, now driving this marvelous car value.

The Greatest Car Value the World Has Ever Known

Mitchell

$1250

"*THE* SIX OF '16"

Mitchell-Lewis Motor Co., Racine, Wisconsin

Carl H. Page Motors Co., Broadway at 59th Street

VALUE

When all claims for tire supremacy are made and checked up against tire performance, the big fact remains that motorists will repeat only on those tires that have shown real value. Such are

MATTSON TIRES

We shall tell you about them in more detail in later ads. But chiefly important **now** is the fact that they are far beyond the usual quality for standard tires, and we sell them on a basis which puts real profits into tire selling for those dealers who know how to push their goods.

A fine selling proposition and a liberal exclusive territory arrangement await dealers who are wise enough to grasp this opportunity.

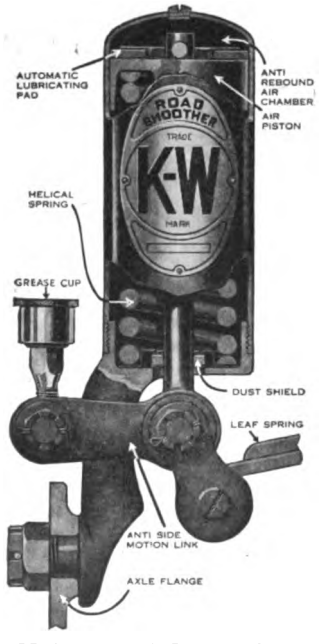
$15 With Regular Kick Switch
$16 With K-W Autolock Switch

K-W Autolock Switch
$3.50 Complete



K-W Road Smoother
$15 Set of Four One for Each Wheel

TRADE K-W MARK PROTECTION

The name K-W is really a symbol of protection for both the motorist and the dealer.

To the Ford Owner

The K-W Autolock Switch protects your Ford car absolutely against theft or tampering when left in garages or in the street.

The K-W Master Vibrator protects you from the annoyances of poor ignition. It gives you surer and better ignition than high tension magneto—easier starting in cold weather—one adjustment instead of four—more power—a hotter spark—cleaner spark plugs, and all on less gasoline.

K-W Road Smoothers protect you and the parts of your car from the jolts and bumps common to riding over rough, rutty, frozen roads. They smooth out the kicks and worries of the road. Where you ride there are no jolts—no jars. They are so constructed that they absolutely do not interfere with the steering. They prevent side motion and rocking.

Right in your neighborhood you will find a Ford car equipped with a K-W Master Vibrator and Autolock Switch or Road Smoothers. Ask the owner what they are doing for him every day. He can tell you better than we of the efficiency, economy, and reliability of K-W products.

K-W products are the Standard of Excellence all over the World. They are sold by dealers who know the difference everywhere. If yours is out sent prepaid on receipt of price.

To the Dealer

The integrity of the name K-W prohibits exaggerated claims and promises. It is a symbol of fair dealing, as important to you as this mark on K-W apparatus is a guarantee to the user of quality, reliability and service. This broad, square-deal K-W Policy protects you, Mr. Dealer.

The K-W line is a profitable one for live dealers. Write for our liberal sales plan today.

Visit our booths at the New York Automobile Show, D 92-93.

PAIGE

The Standard of Value and Quality

The Paige Message to You

ON THESE four pages you will read a message the importance of which every progressive and successful motor car dealer in the country will be quick to recognize.

It is the announcement of the Paige Line—exclusively six-cylinder cars—for 1916.

You will find there a detailed description of the new Paige Fleetwood "Six-38," $1050—a five-passenger reproduction of the incomparable Paige Fairfield "Six-46."

Your experience and trained judgment will detect the extraordinary roominess, the beauty, luxury, power and unique value of this new Paige.

You will find in this Paige Message a statement of Paige Plans for the big seven-passenger Fairfield "Six-46," the Supreme "Six" of the year, the car that established new standards of value and quality in six-cylinder cars.

Read these pages carefully. Consider well the cardinal requisites of motoring luxury and motoring service. Note the roominess, beauty, comfort, power, elegance of equipment and excellence of construction of these two Paige "Sixes." Compare them, in these vital essentials, with any other "Sixes" on the market.

Satisfy yourself that the Value and Quality are there. Whatever car you sell, satisfy yourself that price reduction has not been accompanied by quality reduction.

Compare it with the Paige "Sixes"—the five-passenger "Six-38" at $1050, and the seven-passenger "Six-46" at $1295.

Then, we are confident, you will be quick to realize the supreme advantage, the invincible position and unique range in values and prospect-selling the Paige offers you.

You know of your own knowledge that the Paige Fairfield "Six-46," among seven-passenger six-cylinder cars, has been accepted as standard and supreme.

You will instantly grasp the fact that the new Paige Fleetwood "Six-38" at $1050—in practically every important feature a reproduction of the "Big Six"—must inevitably win country-wide endorsement and popularity in the field of five-passenger cars in precisely the same way.

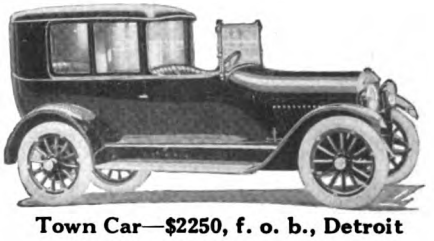
With these two Paige "Sixes" in 1916 you will occupy an impregnable position. You need fear no competition. You can sell any prospect. You are entrenched in Paige Prestige and Paige Supremacy.

You have behind you the momentum and support of a tremendously successful company, a line of extraordinary latitude for all selling conditions and the supreme popularity of Paige cars.

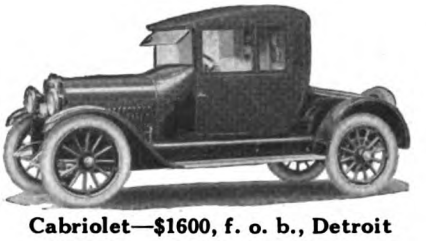
Therefore, we ask you and urge you to read this Paige Message with closest attention and discriminating judgment.

We are confident of your conviction.

Paige-Detroit Motor Car Company, Detroit, Michigan



Town Car—$2250, f. o. b., Detroit

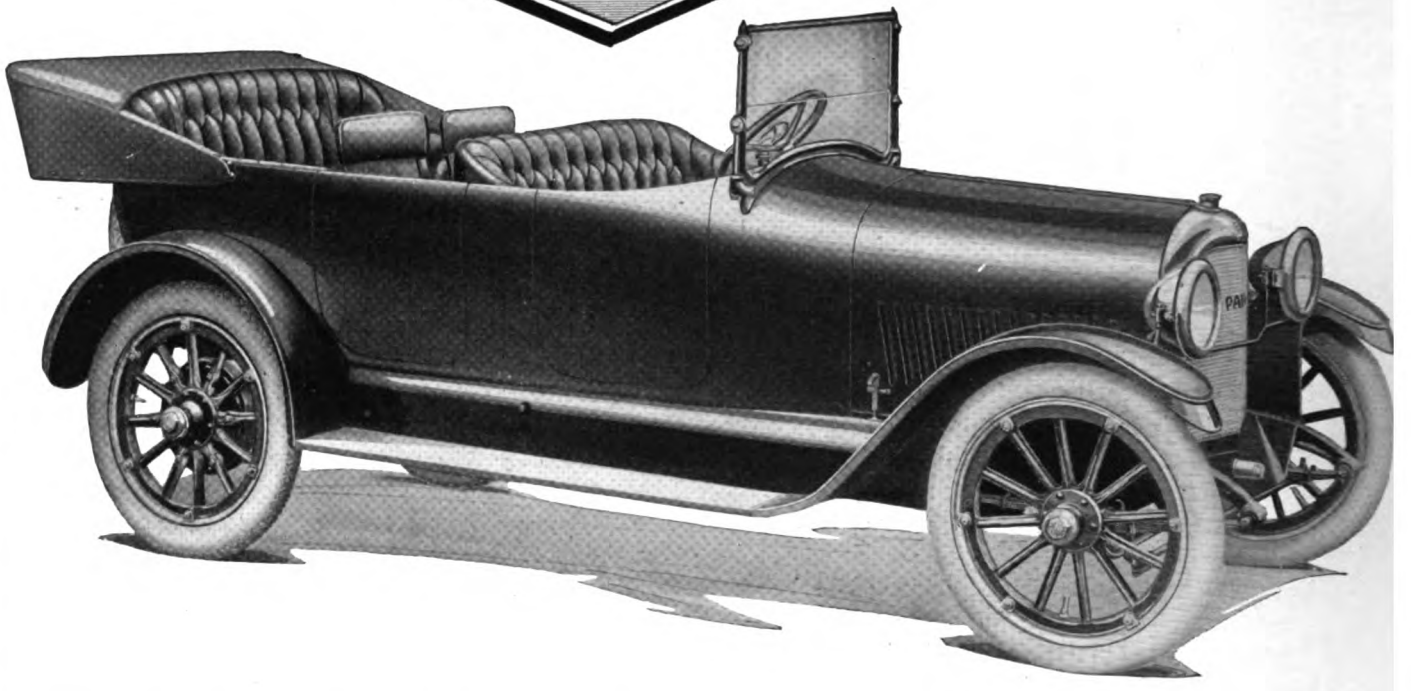


Cabriolet—$1600, f. o. b., Detroit

Sedan—$1900, f. o. b., Detroit

PAIGE

The Standard of Value and Quality



The Bulwark of Paige Supremacy
The Fairfield "Six-46"

YOU know this car. The whole country knows this car. This car instantaneously created a demand which never permitted the Paige factory to catch up with orders until the huge annex was opened, although the plant worked night and day.

This Fairfield "Six-46" is the car which in the popular judgment of what power, flexibility, beauty, service and motoring luxury and elegance should be, established new standards.

Its refinements and improvements have been brought down to the current hour of the industry. The Fairfield "Six-46" holds and will continue indefinitely to hold the Leadership of all real Quality cars among the medium priced "Sixes."

It is so firmly entrenched in the appreciation, confidence, even affection of the discriminating motoring public that it is guaranteed a continuous demand. The Fairfield "Six-46" is an American institution.

With the Fairfield "Six-46" the Paige first won the Supremacy of the "Sixes." With it, re-enforced now by the new five-passenger Fleetwood "Six-38," Paige will continue to hold the Supremacy of the "Sixes."

This, then, is the Paige Line:

The seven-passenger Fairfield "Six-46" at $1295.

The five-passenger Fleetwood "Six-38" at $1050.

Does the entire motor car field offer you a better, surer business opportunity than this?

Paige-Detroit Motor Car Company, Detroit, Michigan

Specifications—"Six-46"

Motor—46-50 H.P.; six cylinder; cast en bloc from special gray iron; bore 3½", stroke 5¼". Bottom of crank case sheet steel.

Transmission—Three speeds forward and reverse in an aluminum case at rear of motor. Transmission gears and shafts are Chrome nickel steel, heat treated and ground. Shafts carried on annular ball bearings and Hyatt roller bearings. Oil capacity 2 quarts.

Clutch—Multiple disc, cork inserts enclosed in flywheel and running in oil; 14 discs; 36 corks in each of seven driving discs.

Frame—High carbon steel, channel section 4" deep and 3" wide, ⅛" thick. Narrowed in front with drop in front of rear axle.

Springs—Special spring steel stock, heat treated. Front semi-elliptic 36" long, 2" wide. Rear: Cantilever type 48" long, 2½" wide.

Tires—Goodyear or Firestone 34"x4"; safety tread on rear.

Wheel Base—124".

Steering Gear—Jacox irreversible screw and split sleeve type.

Carburetion—Rayfield, filled with hot air intake tube. Dash adjustment.

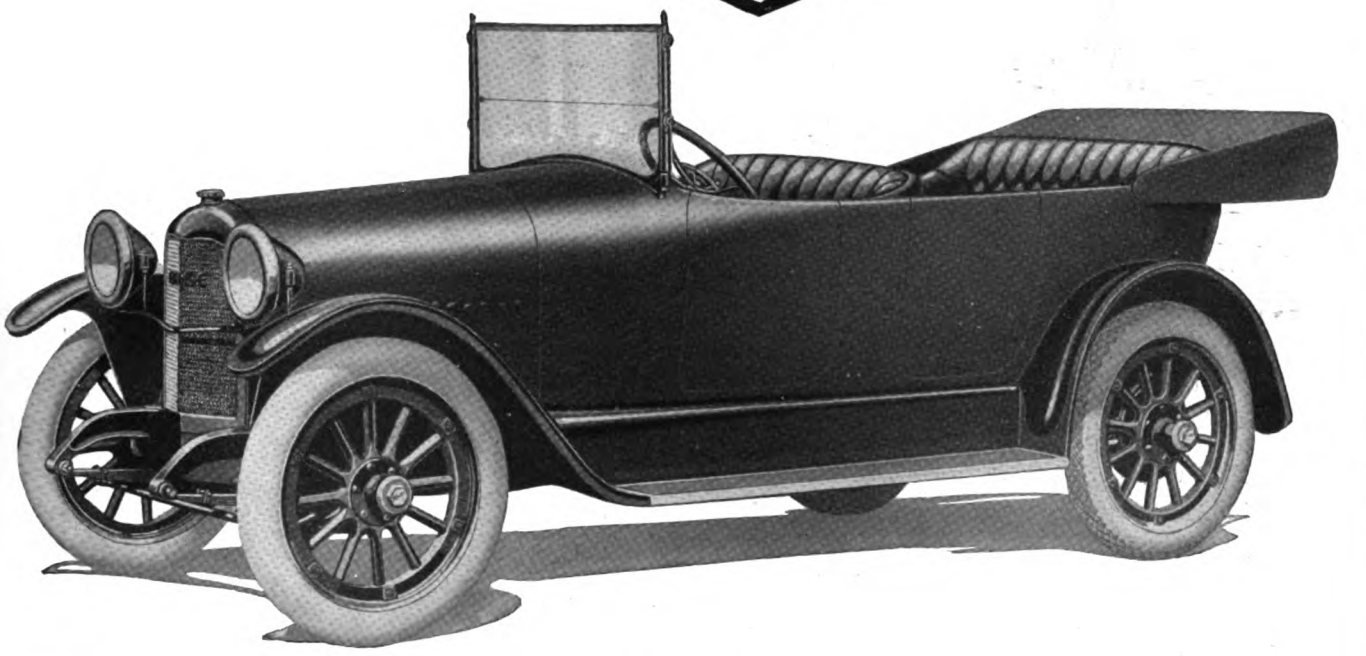
Electrical System—Gray & Davis improved electric starting motor; Gray & Davis separate electric generator with automatic electric governor.

Ignition—Remy high tension distributor and Willard 6-volt battery.

Standard Colors—Paige Richelieu Blue; red wheels. Nickel trimmings all models.

PAIGE

The Standard of Value and Quality



Specifications—"Six-38"

Motor—38 H. P.; six cylinder; cast en bloc from special gray iron; bore 3⅛", stroke 5". Cylinder head cast separate. Bottom of crank case sheet steel.

Transmission—Three speeds forward and reverse in an aluminum case at rear of motor. Transmission gears and shafts are Chrome nickel steel, heat treated and ground. Shafts carried on annular ball bearings and Hyatt roller bearings. Oil capacity 2 quarts.

Clutch—Multiple disc, cork inserts enclosed in flywheel and running in oil; 14 discs; 36 corks in each of seven driving discs.

Frame—High carbon steel, channel section, 4" deep and 3½" flange; ⅛" thick. Frame tapers to 29" in front, giving short turning radius.

Springs—Special spring steel stock, heat treated. Front semi-elliptic 36" long, 2" wide. Rear: Cantilever type 44" long, 2¼" wide.

Tires—Goodyear or Firestone 32"x4"; safety tread on rear.

Wheel Base—117".

Steering Gear—Jacox irreversible screw and split sleeve type.

Carburetion—Rayfield, fitted with hot air intake tube. Dash adjustment.

Electrical System—Gray & Davis improved electric starting motor; Gray & Davis separate electric generator with automatic electric governor.

Ignition—Remy high tension distributor and Willard 6-volt battery.

Standard Colors—Paige Richelieu Blue; straw wheels. Nickel trimmings all models.

Here Is The Proof That Paige Quality Is Again Supreme

FIRST, we want to introduce to you—and to every man whose business it is to study and judge motor car values—the newest Paige—the five-passenger Fleetwood "Six-38."

We ask you to examine as exhaustively, impartially and critically as you can every detail, every specification of this car—which you will see at the New York Show, and all the other Automobile Shows this winter.

We ask you to bear firmly in mind these Three Vital Facts: First, that the price of materials and labor has increased substantially; second, that this new Paige Light "Six-38" is in actual Sterling Quality and Value an even more remarkable offering than the Paige "Six-36" which sold at $1095 (and was sold out by November first); and, third, that in spite of this substantial increase in actual manufacturing cost, this new Paige Fleetwood "Six-38"—in every important feature a reproduction of the great seven-passenger Fairfield "Six-46"—is offered for $1050. That is actually a reduction of $45 for more actual quality.

There are reasons why the Paige—and probably the Paige alone—can do that. We have brought our manufacturing equipment and methods to the highest degree of efficiency. For efficiency and economy we believe that the Paige is unsurpassed. We have put into operation the huge factory annex, which means a capacity of 150 Paiges a day and a scheduled production of 20,000 Paiges this coming year. We have the lowest over-head expense per car, we believe, in the motor car industry.

That is why Paige CAN honestly lower price and actually give More Quality.

That the Paige actually HAS added quality at a lower price is for you to judge.

Paige-Detroit Motor Car Company, Detroit, Michigan

PAIGE

The Standard of Value and Quality

What Paige Popularity Means to Paige Production

PRESIDENT Harry M. Jewett, in his message to Paige Dealers, has just said:

"Paige quality, which was supreme last year, which has been supreme all this year, will this coming season be recognized immediately as still more incomparable.

"THERE WILL BE NO COMPROMISE OF PAIGE REPUTATION, PAIGE CHARACTER OR PAIGE QUALITY."

With Paige Quality assured, the Paige Problem this coming year is to Supply the Overwhelming Popular Demand for Paige Cars.

We have solved that Problem.

Below, on this page, you see a photograph of the Detroit plant of the Paige—with the huge new annex just completed and now in full operation.

This plant gives the Paige a capacity of 150 cars a day.

Do you realize what a stupendous production of motor cars—of Paige Quality and at Paige Prices—that is?

Still more important, however, is the fact that we actually have the materials, the equipment, the men, the resources to meet any Popular Demand for Paige Cars—however tremendous it may be.

Paige is prepared.

You will grasp the significance of this—because you see that Paige is making and will continue to make Immediate Deliveries.

It will no longer be necessary to keep Paige Purchasers waiting a month, even three months, for the one car of their choice.

You know that this huge fact alone—Immediate Deliveries—means the safeguard of your own investment and the guarantee of a year's successful retail business.

Of the impregnable financial strength, of the integrity and stability and unique prestige of the Paige-Detroit Motor Car Company we need tell you nothing. You know these facts yourself.

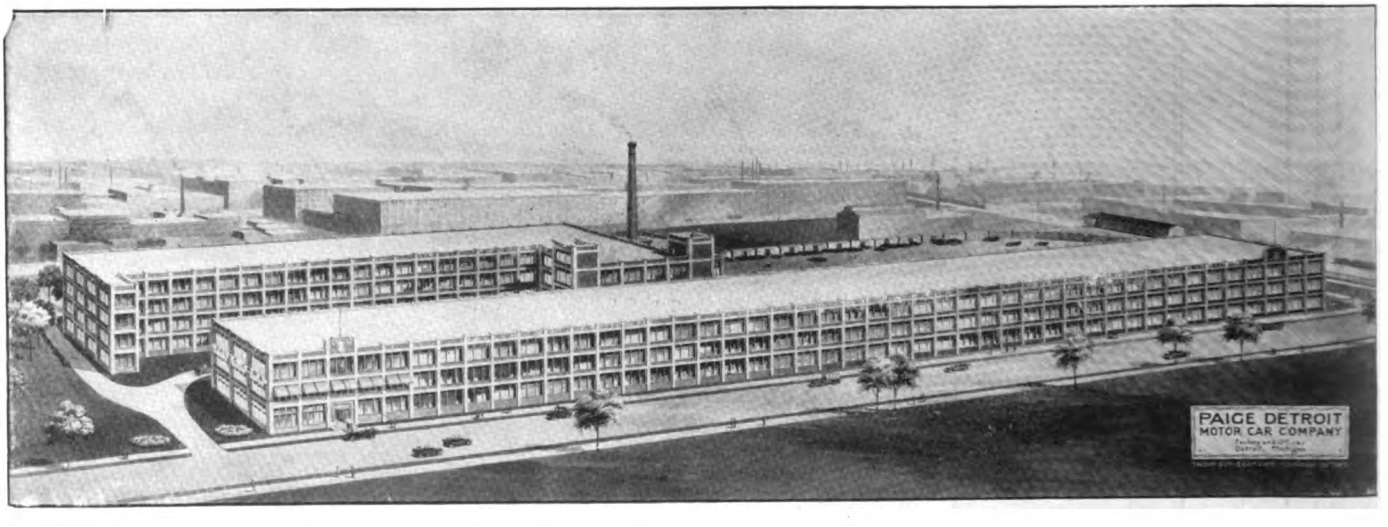
Of the Supreme Quality of Paige Cars—which means low repair bills to Paige Owners and minimum service cost to Paige Dealers—we need tell you nothing. You know these facts yourself.

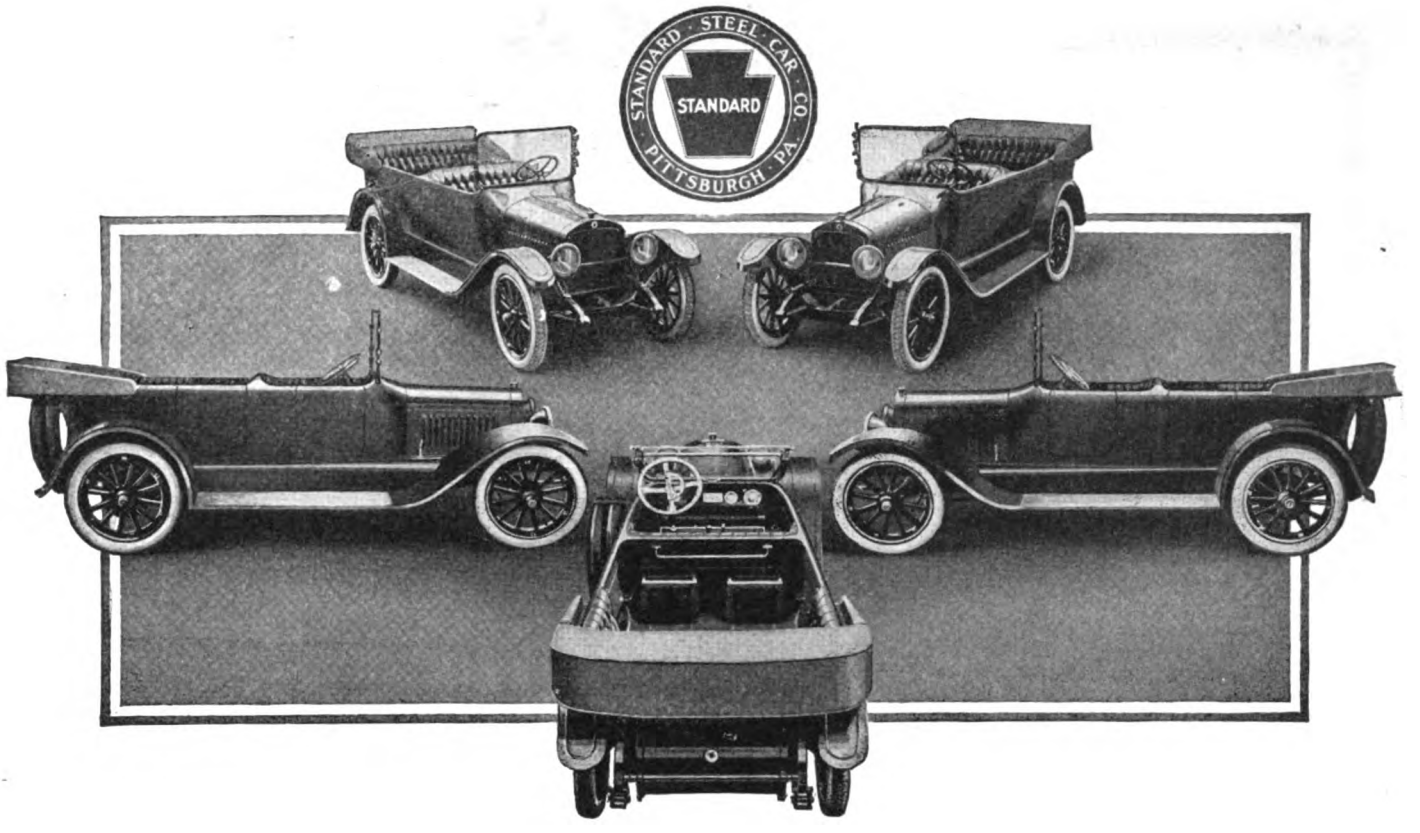
This year, of all years, with the tremendously increased Paige Production: with a popularity and public confidence unique in the motor car industry back of us, there is a tremendous reward awaiting every alert and loyal Paige Dealer.

For three years now Paige has led the way. We believe that every successful, money-making, well-established Dealer wants the support of a company as sound as the Paige and wants to sell a product of the Quality and Value and Character that distinguish Paige cars. Also, the Paige-Detroit Motor Car Company wants Dealers who know and appreciate the Quality and Value and Character of Paige Cars.

Are you the man?

Paige-Detroit Motor Car Company, Detroit, Michigan





"8" STANDARD

THE production of Automobiles by the Standard Steel Car Company is a logical development.

Regularly engaged in designing and building the steel transportation equipment, of all kinds, which has done so much for the safety and comfort of the traveling public—controlling all necessary facilities, in both men and material—and with an organization trained along the lines, primarily, of determining the best thing to do, and then the way of doing that best thing repeatedly and uniformly—the production of Automobiles came nearly as a natural sequence.

About four years ago the Standard Steel Car Company commenced to use its resources and facilities specifically in the designing and manufacturing of Automobiles—its progressive steps being directed by careful study and analysis under laboratory conditions, supplemented and verified by service tests.

One year ago, having foreseen and experimented with the eight-cylinder type of motor, the Standard Steel Car Company brought forward its "Standard Eight"—one of the few of its kind which had been offered to the public.

In now announcing the 1916 "Standard Eight," we can state that it has been born of thorough and extensive experience, under all-varying conditions of sufficient severity to detect any defects or oversights in the 1915 product—and with the happy conclusion that no changes have been indicated as necessary in the mechanical features, and only such changes in body construction as are required to meet the latest demands.

It is of the greatest importance that the automobile purchaser should know that he can depend upon the representations and workmanship of the manufacturer, as well as upon the sort of treatment and service he will receive.

The reputation of the Standard Steel Car Company is in itself assurance that the purchaser of its products will not regret his confidence in the people he deals with, nor be deceived or disappointed in what they furnish him.

A 1916 seven-passenger "Standard Eight," at $1,735, is not an experiment with an unknown quantity—but is, rather, the investment of money in an article of proven merit and reliability, produced by people who know what they are doing and have the resources to do what they know should be done.

Among the features of appealing interest and importance of the "Standard Eight" are its light weight, wedge-shaped frame, staggered cylinders, double universal (anti-skid) drive of the Hotchkiss type, the force-feed oiling system, etc.

From All Viewpoints the "Standard Eight" Excels.

Paterson Dealers Talk Facts

Dealers who sell Paterson cars are never up against the necessity of having to talk mere generalities.

Apologies are never necessary.

The Paterson embodies all those essentials of equipment so universally demanded by the car owners of to-day. And the dealer can talk facts — always.

There is no reluctance in pointing out the features of the new high-speed, six-cylinder Continental Motor, 3¼" x 4½"; of going into complete details of the Delco system of starting, lighting and ignition, the Willard storage batteries, Stewart-Warner Speedometer, Stewart Vacuum Gasoline System, the new Stromberg Carburetor, Goodrich 32" by 4" tires (Safety Tread, rear).

Then there is the one-man top, neat dust hood, quick adjustable side curtains, full ventilating rain-vision windshield, electric horn, demountable rims, and full tool equipment, that go to make up the complete car.

And the car is big and roomy—117" wheelbase.

It is those details of vital importance about which the experienced automobile buyer asks that the Paterson dealer is always proud to demonstrate.

Dealers have already specified for 90% of the 1916 output.
Complete specifications and information on request.

Vision

THE Scripps-Booth car was created of a vision of quality—of the luxury of the distinctive home, of the preferences of the woman of taste, of the judgment of the man of business, of the spirit of home happenings and gifts; all combining into a vision of a car of light weight but of maximum luxury which fits naturally into the highest home atmosphere.

No car ever before created can claim this spirit, nor take so intimate a relation to the home as the Scripps-Booth luxurious light car. It is this intimate spirit of design which has placed the Scripps-Booth car before the doors of the most luxurious homes in America, while the spirit of the car without has entered into the home itself and has moulded the home atmosphere.

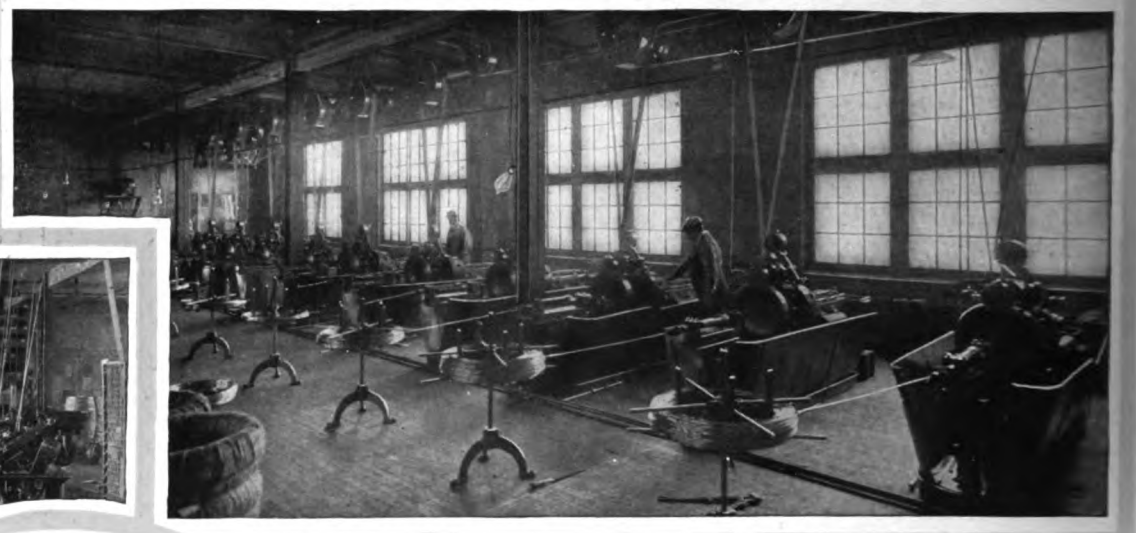
A YEAR OF MARVELOUS GROWTH

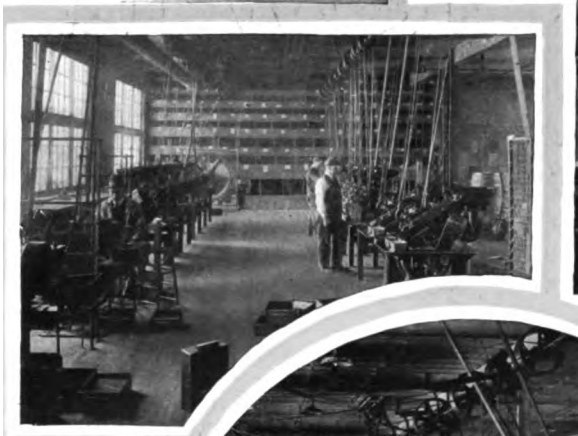
If all the Houk wheels now in use were made into one huge wheel, its size would dwarf man's biggest creations.

HOUK
QUICK-CHANGE
WIRE WHEELS

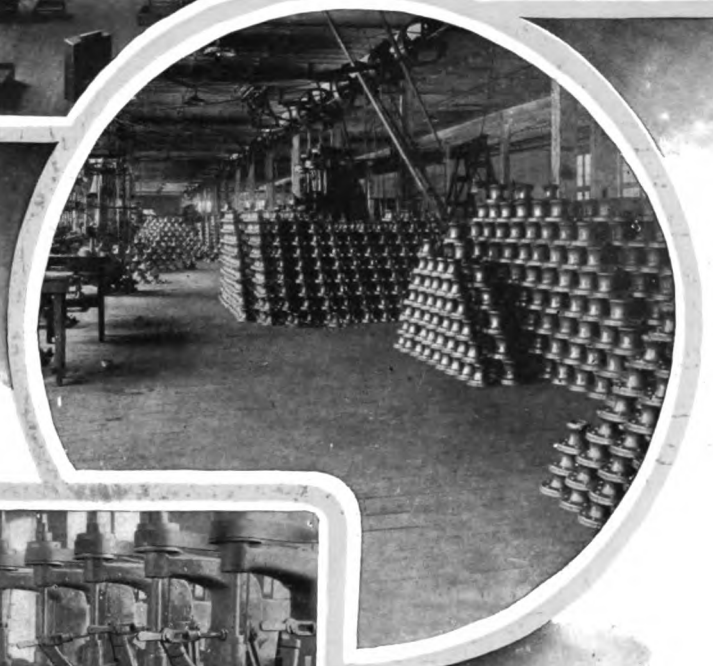
For light weight and supreme strength, nothing represents greater skill or ingenuity than the Suspension Bridge. The Houk Wire Wheel is built on the same principle.



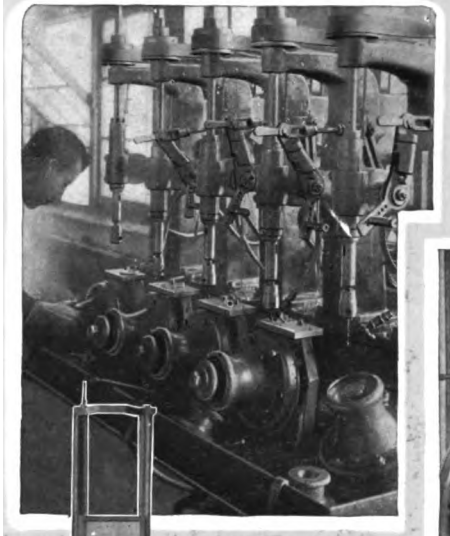
Nipple Making Machines

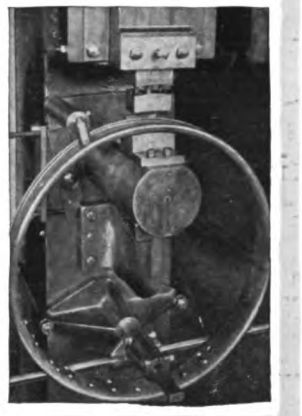


Spoke Making Machines



Hub Shell Department





Testing the Tensile Strength of a Spoke at 3200 lbs.

19

THE BIG

THE MOST important single advance in automobile construction in the year 1915 is the establishment of the unquestionable supremacy of the wire wheel. No other engineering movement has made such conclusive strides as the wire wheel. Nothing has been more positively clinched as a principle of ultimate automobile construction than the Houk Wire Wheel.

For several years the wire wheel has been "a'brewing." To be sure it has been used by sportsmen, motor car fanciers, and race drivers.

But 1915 experienced a wave of enthusiasm and realization of the advantages of the wire wheel, which spread from coast to coast.

With the advent of 1915 the Houk Plant at Buffalo was working along with the serene conviction that America like Europe ***must adopt*** the "best engineered" wheels ever devised for motor cars. The production was all that could be conveniently accomplished without crowding, and the demand was exactly co-ordinate with that production.

The beginning of 1916 sees the Houk Plant at Buffalo nearly double in size. The machines never stop. Special machines of all sorts have been developed or obtained. New special machines have been completed for assembling in remarkably short time absolutely ***true*** wire wheels. A very large and modernly equipped enameling department has just been opened, and one entire floor of one of the newer buildings has been turned into a really

Atomizers in New Enameling Department

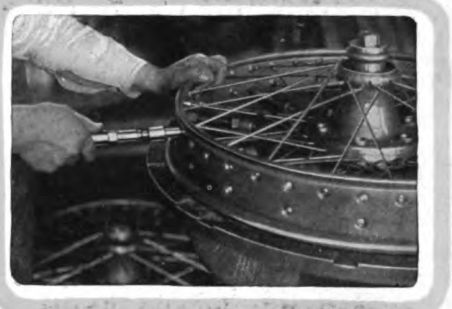
5

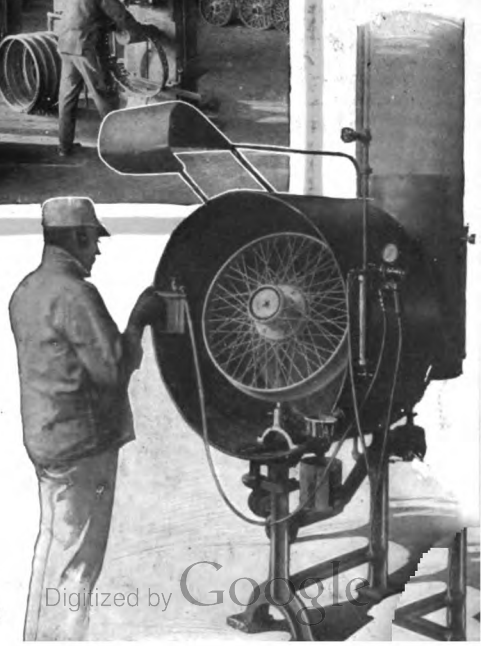
HOUK YEAR

Hub Dept.



Punching Rims

Tightening Up Wheels



Spraying Enamel

wonderful department where spokes and nipples are completely produced by automatic machines.

No more activity has been experienced anywhere in the automobile industry than has been found at the Houk Plant where every effort has been made to keep pace with constantly growing demands, the size of which could scarcely have been realized a year ago.

"Wire Wheels" has come to be the slogan of car-maker, car-dealer and car-purchaser. "Wire Wheels" has come to be the mark of distinction on America's best cars and the demand for these wheels coming from the car manufacturer who in turn received his orders from his dealers, has been growing in volume so rapidly that it has strenuously overtaxed our facilities.

Unfortunately, the day this story is written we are behind on our *immediate* deliveries over fourteen thousand wheels. Nevertheless, since that is but a small proportion of our production, this shortage will quickly be wiped out. And our facilities are being expanded so rapidly that we anticipate keeping well apace with this constant increase of orders.

Those who have visited the Houk Plant recently can scarcely understand this phenomenal growth and in fact, it would be unintelligible if it were not for the fact that the American Automobile Industry is on the most prosperous basis, producing more cars than ever, and the American public has awakened to the realization that *wire wheels* are basically essential on a *modern* car.

We certainly cannot supply all the cars made with this carefully built wheel but we *can* supply a large proportion of all the first class cars.

Stock or Optional Equipment on America's Finest Cars

TWO years ago the car manufacturer said "The wire wheel! Oh, that's a European idea, our American wooden wheels are every bit as good."

A year ago, he said, "Wire wheels, oh yes, they are indeed a fine article but they cost more money to build and we think our wooden wheels are good enough."

To-day he says, "We aim to build the best motor cars, and knowing the supreme character of wire wheels, we feel that we *must* use them," or, he may say, "Since it cost much more to make wire wheels, we simply can't afford to put them on at the list price, but for a small additional charge we will be delighted to equip the car for you."

To-day, *every* car of any particular engineering value offers Houk Wire Wheels as a *necessity.*

Moon Cars Sell—and "Repeat"

Fifty per cent of the entire Moon sales represent increased output to new buyers. The other fifty per cent are sales to people who have owned one to three Moon cars previously.

There is just one reason for this: ***Satisfaction.*** More than mere satisfaction with the price. Satisfaction with the car's performance, based on power, economy of maintenance, beauty, comfort, smoothness in running, and length of life.

This satisfaction is shared by buyer and dealer alike. You will see the reason for it in the new models of the

"No Car Is Easier To Sell"

The vast majority of cars will be bought this season by people who have owned cars before.

It is human nature to change.

This means thousands of car buyers will **come down** from higher priced cars to the common sense Auburn prices. Also, thousands will **come up** from the cheap cars to the economical but good-looking and roomy Auburn type.

Don't judge until you let us submit the **proof** that the Auburn gives "The Most for the Money." And where can you find a car backed by a more reliable and successful institution built upon sixteen years' experience?

In looks, the Auburn ranks alongside the most costly imported cars.

In mechanical construction, it is sane and dependable—perfectly modern but not experimental in any feature.

We were one of the first to realize that the foundation of permanent business must rest upon **Money-making dealers.**

It costs you nothing to learn the Auburn proposition for dealers, so write us at once. No matter where you live, small town or city, write us—we have something of vital importance to tell you—**we have an offer you cannot afford to overlook.**

Model 6-38; $1050—Six cylinder, 3x5; Cantilever springs; Electric lighted and started; Spacious tonneau and driving compartment; 34x4 tires; 120-inch wheel base; Completely equipped; 3 and 5 passenger models.

Model 4-38; $985—Four cylinder, 3⅞ x5; Cantilever springs; Electric lighted and started; 34 x 4 tires; 114-inch wheel base; Completely equipped; 2 and 5 passenger models.

Model 6-40A; $1375—Six cylinder, 3½ x5; Cantilever springs; Electric lighted and started; Luxuriously roomy tonneau and driving compartment; Folding auxiliary seats; 35x 4½ tires; Completely equipped; 2 and 7 passenger models.

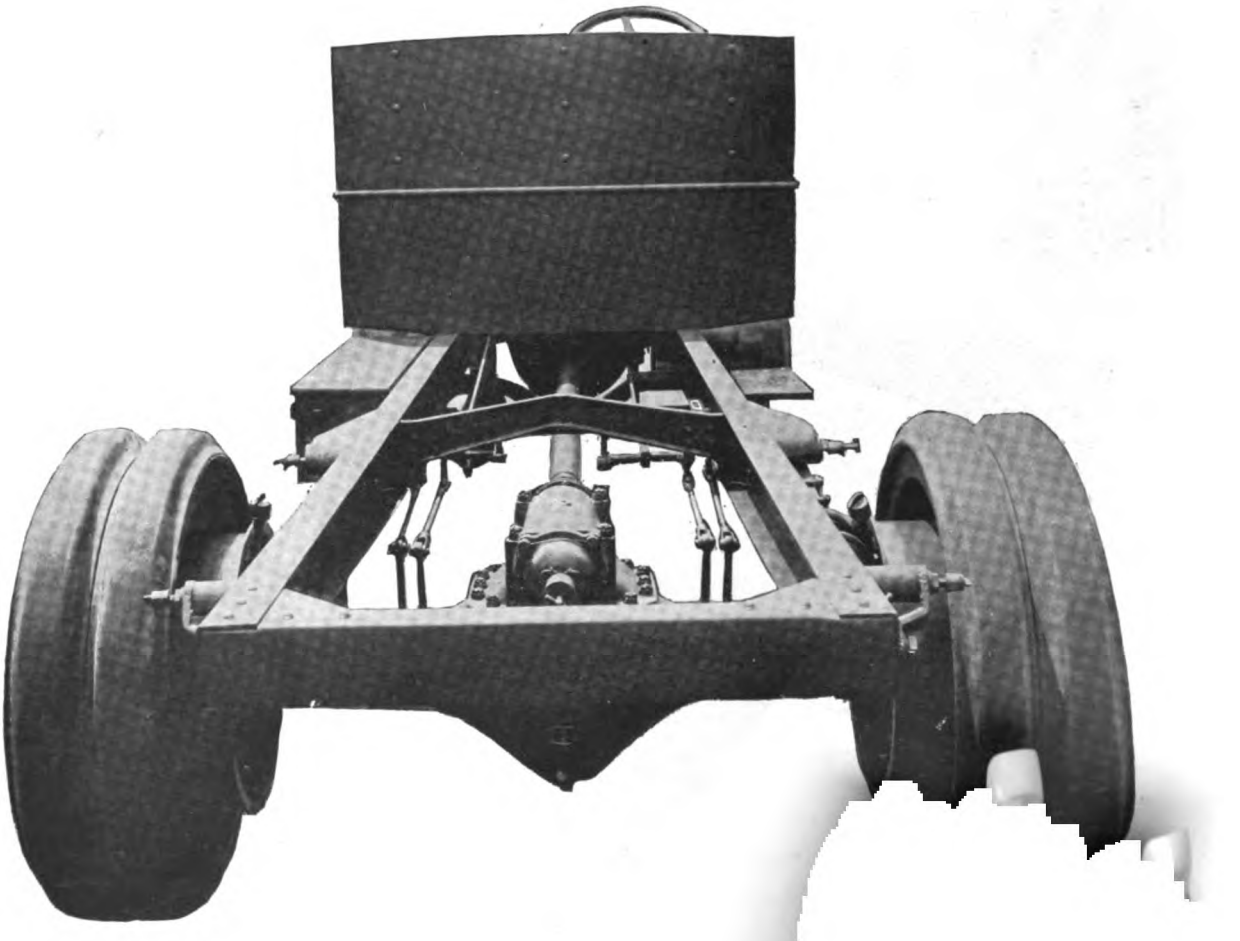
AUBURN AUTOMOBILE CO., Auburn, Indiana, U. S. A.

Power and Simplicity

YOUR particular attention in this Sheldon advertisement is directed to the clean cut, simplified appearance of the

SHELDON

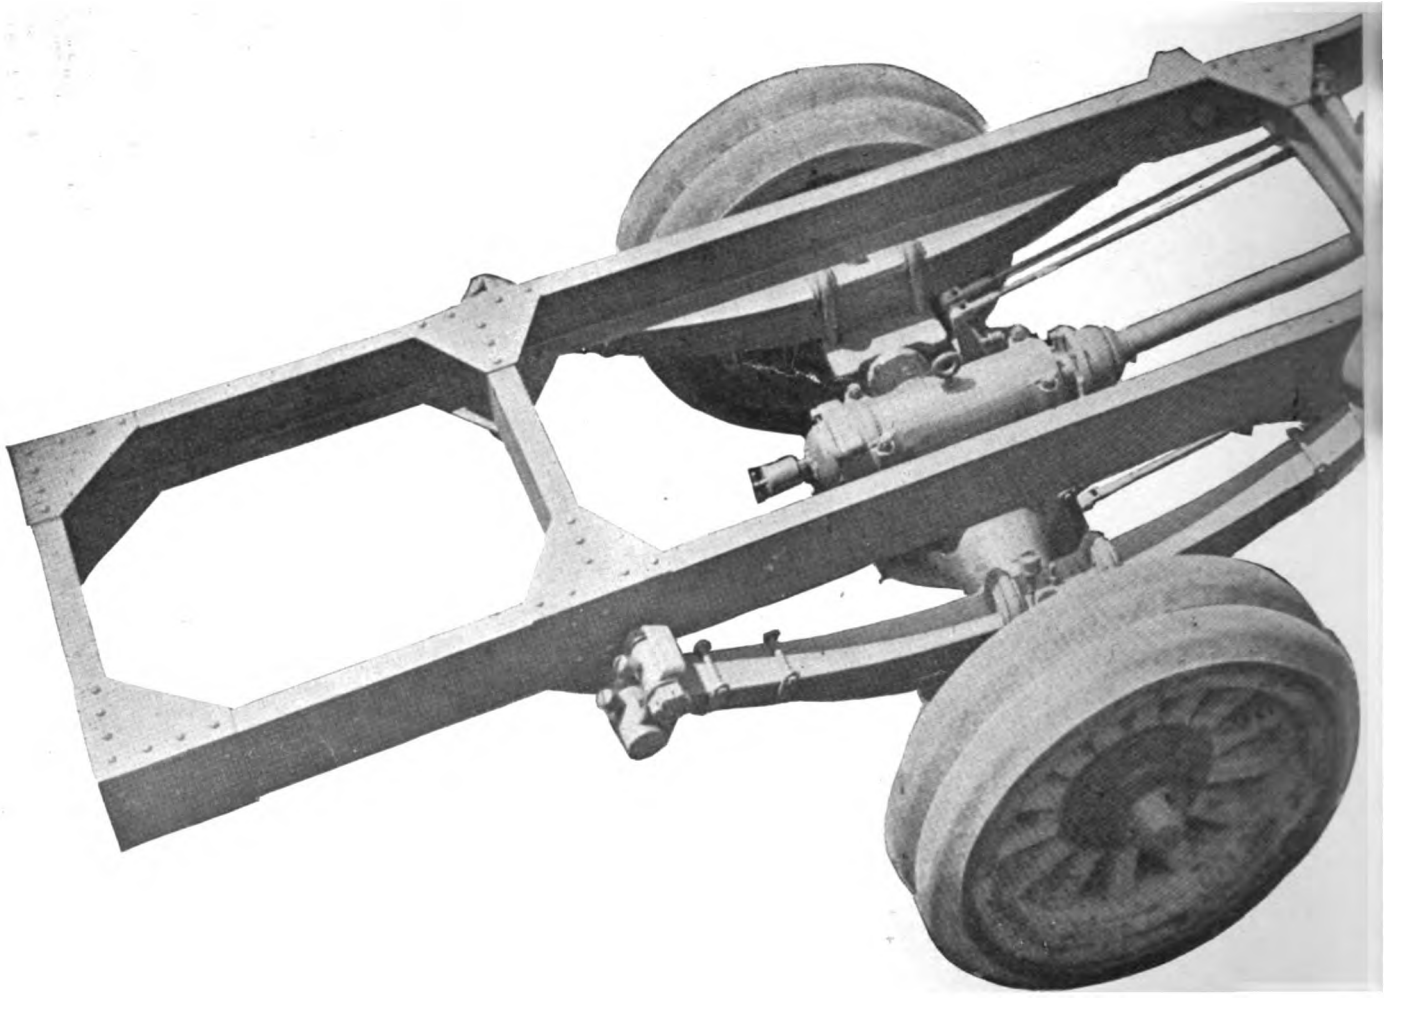
Worm Gear Chassis shown in various positions. Note them carefully and then remember that such construction is possible today only in connection with Sheldon design and Sheldon products.



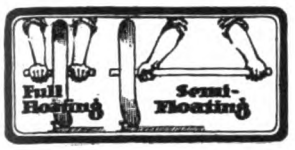
Clean as a H

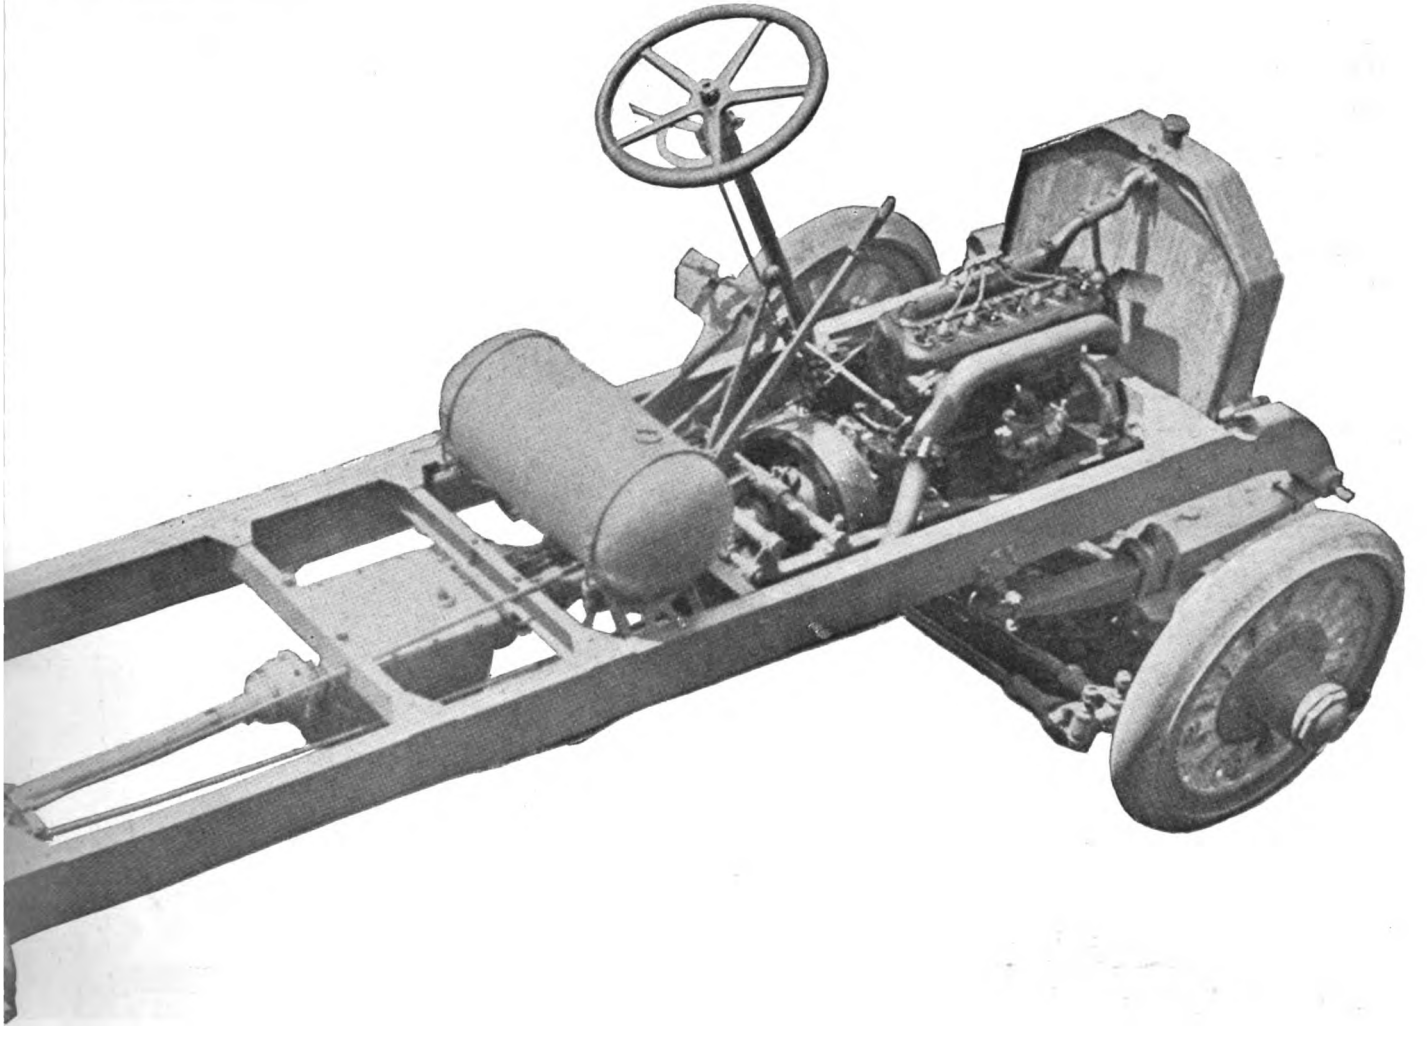
Semi-floating type of construction is primarily responsible for most of the inherent superior qualities of Sheldon worm gear axles. For today the vast majority of truck and axle builders concede what Sheldon, as pioneers, have always contended—that **for simplicity, lightness, capacity and durability there is no equal to semi-floating construction.**

Ball Bearings for carrying the worm and gear loads is another Sheldon characteristic. Both here and abroad practical results from long usage have established clearly the fact that any substitute for ball thrust bearings to take care of the worm thrust load is absolutely impractical.



ound's Tooth





Taking the driving strains through the rear springs (as is done with Sheldon construction) is the greatest single factor in the simplifying and cleaning up of the chassis. For this method of construction does away with all radius rods, torque tubes, and other needless weight-producing complications.

Braking on the rear wheels adds greatly to the life of the entire rear assembly. This is frankly admitted. The trick has been to obtain positive braking efficiency at this point. Sheldon has accomplished this, thereby relieving all the universals and gears of the terrific strains imposed by the propeller shaft brake.

BRISCOE

Now a $6,000,000 Company Manufacturing every part of its cars

A line of three leaders:

THE BRISCOE DE LUXE "FOUR" 38, - - $750
THE BRISCOE DE LUXE "EIGHT" 38, - - 950
AND
THE BRISCOE "TWENTY-FOUR" - - 585
"THE LATEST BRISCOE BEAUTY"

A wonderful demonstration of the dollar-value made possible by the enlarged organization

HERE are eight pages of which you cannot afford to skip a word. The Briscoe Twenty-four, which will be exhibited for the first time at the National Shows, is close to the ultimate in automobile desirability at a very low price. The other models, refined to the utmost, maintain their supremacy. And the Briscoe Motor Company is today without a superior in facilities for economical production on a large scale, and for adequately taking care of both dealer and owner.

A Company Whose Dominant Future is Assured

For some time past the Briscoe Motor Company has felt the need of much larger facilities to meet the steadily increasing demand for its product. Benjamin Briscoe, with his accustomed foresight, early recognized that the big factor in the automobile production of the future would be found among the manufacturers fully equipped to turn out every detail of their product in their own shops, and independent of outside sources of supply for anything but raw materials. For years, too, it has been his ambition to build up an organization of strong manufacturing and selling executives whom he could ask to share with him the full responsibilities and rewards which came from the development of the company.

For some months past, Mr. Briscoe and L. E. Willson, as the representative of prominent Chicago business interests, have been working together to bring about a condition which would not only assure the future of the company as a large producer of motor cars but would enable it to utilize to the fullest advantage the wonderful creative genius of Benjamin Briscoe, unhampered by the many sided activities of directing an entire organization.

These plans culminated in the enlargement of the capital stock of the Briscoe Motor Company to $6,000,000. At the same time a number of parts plants were purchased. These included the plant of the Mason Motor Car Company of Waterloo, Iowa—the machinery of which was moved to Jackson—the Jackson Motor Parts Company and the Jackson Metal Products Company. As a final step in assuring adequate parts supplies, the $1,000,000 Jackson plants of the Lewis Spring and Axle Company were purchased. This in itself gives the company a large and fully equipped motor, axle and drop-forging plant.

From the engineering standpoint, the company has in Benjamin Briscoe a man who is universally recognized as a wizard of design. And in the enlarged organization he will be able to give to his creative effort a wider range that will inevitably accentuate his leadership of the past.

The Briscoe "Twenty-four" is the first development of the new organization's wonderful facilities of production and design. Several pages are devoted to it elsewhere in this announcement. You will agree that it offers a value unmatched in the popular-priced field today.

You, as a dealer, know that today perhaps more than at any previous time, it is wise to look far ahead in forming a connection. It is wise to ask yourself, "Is the company so strongly financed that it will be able to meet competition not only now but two years or ten years from now? If I build up a clientele on this car, am I building on a firm foundation or on the shifting sand of weak finance and changing policies which may destroy all my effort in a season?"

Write us, wire us, or come in to the factory. If you're the right kind of dealer we think you'll see both a present and a future opportunity unmatched today in the business.

BRISCOE MOTOR COMPANY, 105 WILDWOOD AVENUE JACKSON, MICHIGAN

The Policy Back of Briscoe Cars

A STRONG, loyal organization of dealers is essential to success. There is no sense in establishing a large number of dealers unless it is possible to give them cars in sufficient quantity to meet the demand. We have every facility for large production; but we will not sign more dealers than we feel sure we can adequately care for.

We want you to feel that the effort you put into making contracts and sales will not be rendered useless by any lack of thorough co-operation in our production department.

We recognize an obligation on the part of any concern which aspires to manufacturing leadership to produce at all times cars which will enable its dealers to meet competition upon a successful basis. That means not only price competition, but the production of cars which will be so satisfactory in the hands of the user that they will enhance the reputation of the company and its product, and create a sales asset of value for the dealer.

It is our policy to supply Briscoe dealers with a line of cars as complete as possible—a line that will enable them to sell the greatest possible percentage of motor-car buyers in their territories and to give to each class of buyer exactly what it prefers.

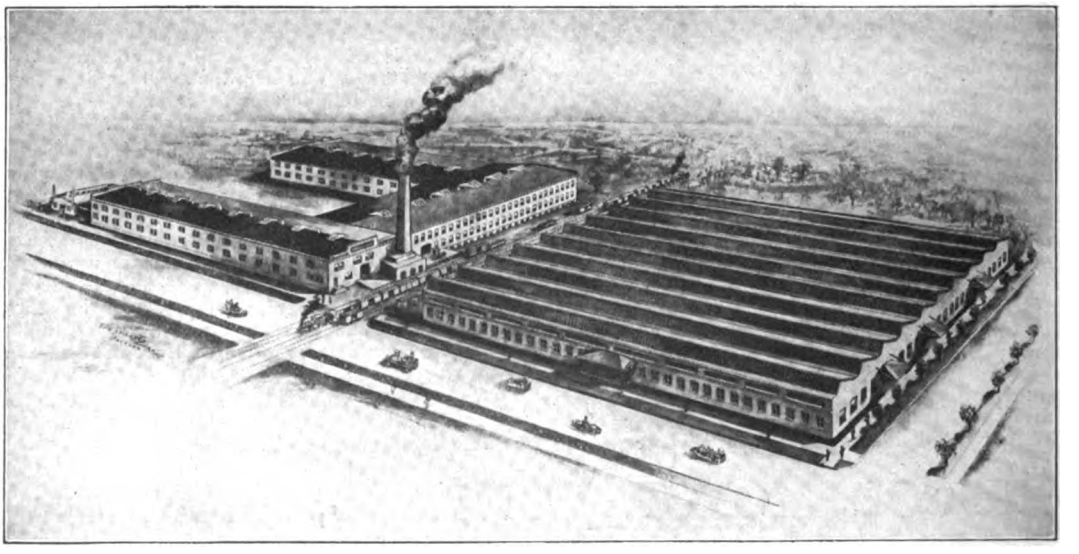
The Briscoe De Luxe "Eight" 38 at $950 and the Briscoe De Luxe "Four" 38 at $750 have already demonstrated their immediate appeal to thousands of motorists. And in the Briscoe "Twenty-four" we believe we have produced a car which is the best possible evidence of our intention to make the automobile value of a dollar greater under the Briscoe name than it has ever been before in automobile manufacture.

Advertising and Sales Co-operation

Adequate advertising in strong mediums is of course a first essential in the success of motor-car selling in large volume. We are employing the best experts obtainable to prepare distinctive, aggressive Briscoe advertising during 1916—advertising with a "punch" in it—advertising that will make Briscoe cars and their supremacy familiar to every automobile buyer in the country.

We shall use good space consistently in an extensive list of mediums. The big national weeklies, standard publications, farm papers, trade papers, newspapers—all will receive adequate representation. We believe that Briscoe advertising during the coming year will compare very favorably in volume per car with any in the country.

We shall get out direct literature of a distinctive type for the general public and every department of our organization will be operated in a spirit of thorough co-operation to increase the sales possibilities of our dealers.



BRISCOE

NOW "A LINE OF THREE LEADERS"

YOU know that the big money for you is in the popular-priced field, provided you can get the **right** line, at the **right** price and with the **right** company back of it.

The Briscoe line, already dominant in two sections of the popular-priced field, now becomes "a line of three leaders."

The Briscoe Twenty-four is literally "the car the public built." For Benjamin Briscoe set himself to build not merely a car which the average motorist would **take,** but one which would make him feel that even at an exceptionally low figure, he had a car without the apologies, excuses or omissions. It will be a wonderful seller, beyond doubt. Here, for instance, is

How You Can Make Sales on the Briscoe Twenty-four

BENJAMIN BRISCOE has always said that beauty is not a question of dollars and cents—that it should cost no more to build a well-shaped body than any other. And the Briscoe Twenty-four is the best possible proof that he's right. For it's a car you'll be proud to ride in—a beauty of the boulevards that will hold its own for looks with any car—and a little more. Modified streamline body, tapering hood, crown-type fenders, raking windshield—the man who sees it says, "Some car!" The woman, "Isn't it a beauty!"

COMFORT

Look at the four full elliptic springs, with an extra leaf in the rear set. Try out the seats and note the deep upholstery bedded on sofa-type springs. It will have to be a pretty rough road before you begin to feel it in **this** car. And you'll notice that with five people in the car there's plenty of leg-room, and body-room, too, for everybody. With a wheelbase of 104 inches, the special body-design affords more room than in many cars considerably heavier.

POWER

The car has exceptional power per unit of weight—and that's the way you want to figure it. Excessive power in a motor-power that you never can use merely represents a lot of your good money going for oil and gasoline that never does you any good. The weight of the Briscoe Twenty-four, ready for the road and including gas, oil and water, is less than 1750 pounds. The motor is of the long-stroke type, with 3⅛-inch bore and 5⅛-inch stroke—the largest motor, and at the same time the most economical in any car of its type today. A floating type axle is used, with the Gearless Differential. This differential has all the advantages of a positive drive in straight going; skidding and sidesway are practically eliminated. And in uneven going, power is delivered only to the wheel on solid ground. It adds greatly to both safety and service.

CONVENIENCE

The starting crank and the clincher tire are fast finding their rightful place in the museum of motor antiquities—exhibits "A" and "B"—useful only to show what owners were once willing to tolerate under the stress of necessity. Every Briscoe Twenty-four is electrically started and lighted—at the service of the woman who has use for a car of moderate size, but who has not the physical strength to cope with a hand-cranked motor. Tires, too, offer no obstacle with the regular Briscoe equipment of demountable rims. The top is the very latest "one-man" type, light enough to be handled easily by one person. The car is equipped with adjustable clear-vision, rain-vision windshield. The car is driven from the left with center control levers. There are three speeds forward and one reverse.

Spark and throttle control are on the steering wheel, and there is a foot accelerator. Two sets of powerful brakes are used, one operated by left foot pedal, and one by a hand-lever at the driver's right.

ECONOMY

You know that within reasonable limits the cost of operating a motor-car may be figured by the pound. The principal items of expense—tires and gasoline—are directly proportionate to the weight. The Briscoe Twenty-four has reduced operating expense to the minimum. The spring and chassis construction keep down the tire-wear; and you'll be astonished at the number of miles a gallon of gasoline will drive the car, fully loaded.

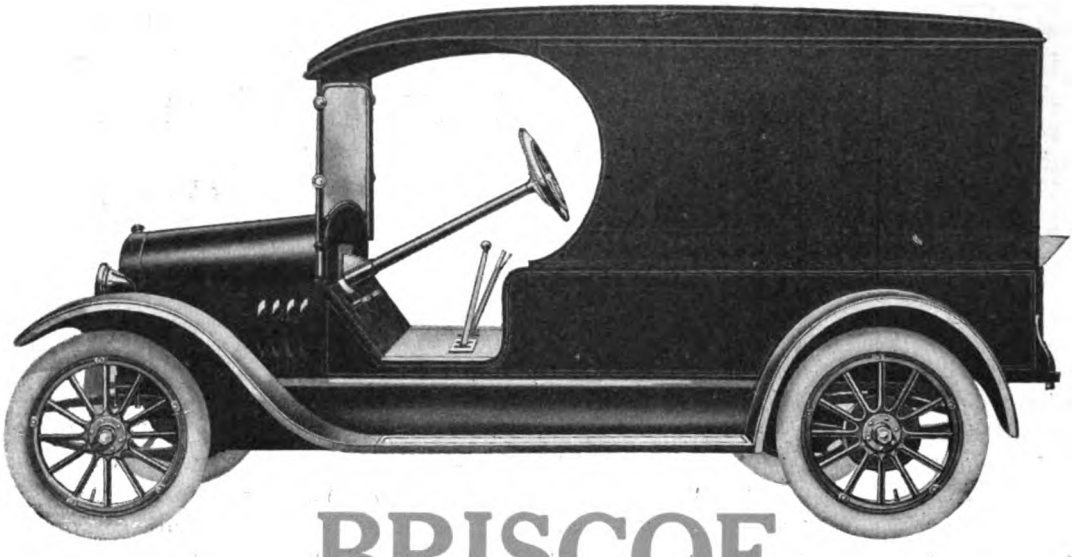
DURABILITY

Every part of the car is there because it has defied all the efforts of our testing crews to break it. These men have given test cars usage that no owner would achieve in a lifetime. Their instructions have been to do all the damage they could. Today, the metals, the bearings, the transmission, the motor, every part down to the smallest screw has passed these tests with flying colors.

Don't wait! Here's the time, and the car. Are you the man? Get action today on your territory—tomorrow may be too late. Good profits, a permanent connection that will become increasingly valuable as the years go by—a live proposition all through.

Come in if you can. But write or wire if that's impossible.

Another Feature of Dominance for Briscoe Dealers



BRISCOE

CONVERTIBLE LIGHT-DELIVERY WAGON

HERE is the solution of the light-delivery problem for thousands of merchants and business men. The Briscoe Light-delivery wagon is mounted on the regular Briscoe Twenty-four chassis, modified to suit commercial requirements. In addition to being stylish and efficient, it is therefore exceptionally economical in upkeep.

There is absolutely no question that the country is turning to motor haulage as never before in its history. Experts estimate that 100,000 light-delivery wagons could be sold during 1916, provided it were possible to produce that many.

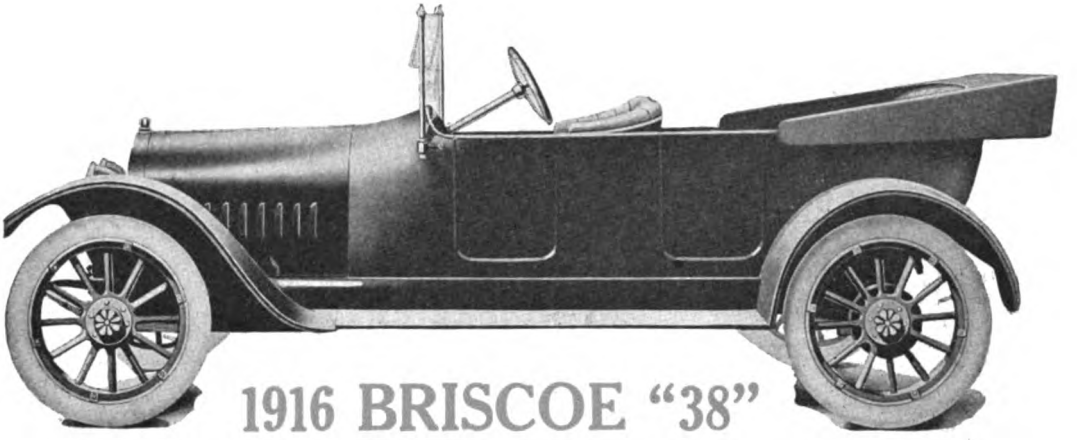
The Briscoe Convertible Light-Delivery Wagon greatly increases your selling field—and most of these sales come during the off-seasons on pleasure-car business.

Open body is standard. But detachable flare-boards, canopy top and full panel sides and back are optional at moderate additional cost. The owner may therefore have in one wagon a combination of all types, instantly adjustable.

$585 ***f.o.b. factory***

We shall popularize the Briscoe Convertible Light-Delivery Wagon by special advertising in a list of mediums appealing especially to merchants with light-delivery problems.

Here's opportunity with a capital O! Tomorrow some quicker man may have your territory.



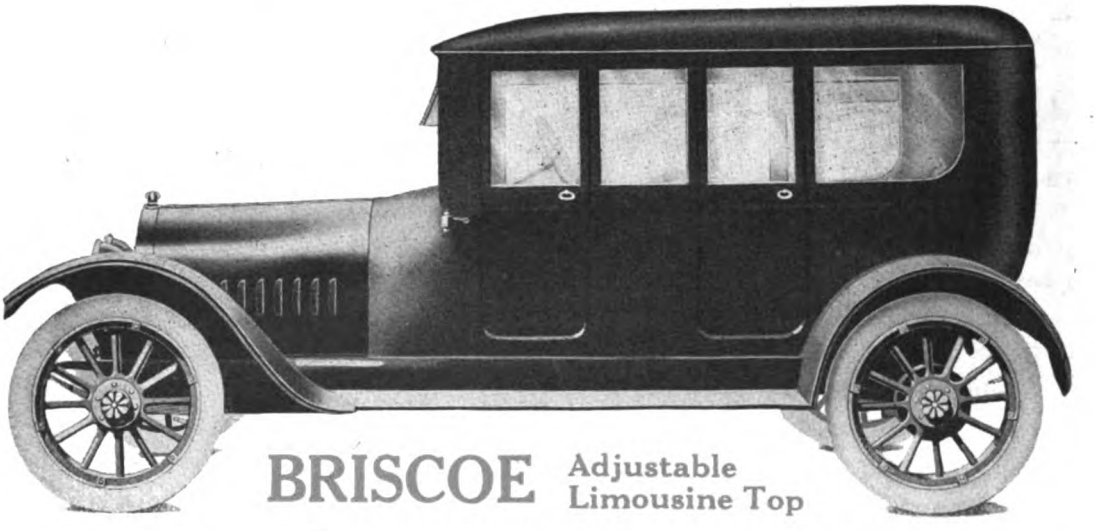
1916 BRISCOE "38"

Four-cylinder and eight-cylinder types

"THE car de luxe." Every refinement that good taste and comfort demand. Especially designed and built throughout to satisfy the most exacting —to please the hard-to-please. Distinctive Briscoe-line body; 38 h.p. motor; full cantilever spring suspension; 114 wheel-base; electric starting and lighting; one-man top and full equipment; 32 x 3½ Ajax tires—with written guaranty for 5000 miles.

An aristocrat of motordom in everything but price.

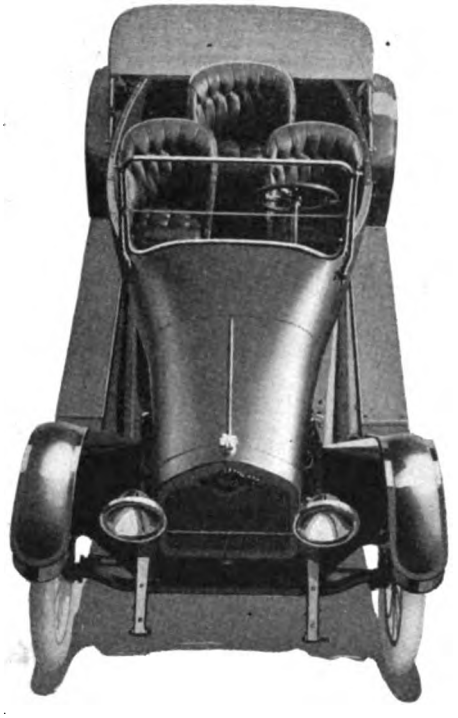
5-passenger Touring Car—4 cylinder	$750
5-passenger Touring Car—8 cylinder	950
3-passenger Clover leaf Roadster—4 cylinder	750
3-passenger Clover leaf Roadster—8 cylinder	950
2-passenger Coupe, 4-cylinder	1000
2-passenger Coupe, 8-cylinder	1200



BRISCOE Adjustable Limousine Top

The Briscoe "38" Touring Car is readily transformed into a stylish weather-defying closed car by means of the perfect-fitting Briscoe Limousine Top. Made throughout of quality materials, and designed especially for the Briscoe, it differs from the ordinary limousine top in looking what it really is—an integral part of the car. Can be supplied on either Four or Eight for $200 additional.

BRISCOE "38"



Clover-Leaf Roadster

COMFORTABLE individual seats for three people—plenty of room for each passenger.

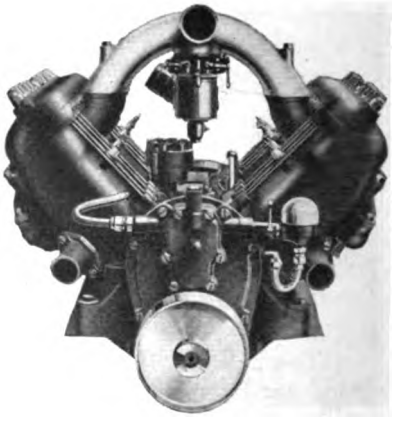
A type that has restored the popularity of the roadster as a small family car.

The construction affords opportunity for exceptionally beautiful body-lines, of which Benjamin Briscoe has taken full advantage. Perhaps no more distinctive car than this runs the road today. Large luggage space at the back.

THE BRISCOE

"Eight-38" Power Plant

IN this connection the wide foreign engineering experience of Benjamin Briscoe perhaps shows to best advantage. The motor has a 3-inch bore, with 3⅛-inch stroke. It is one of the most accessible 8-cylinder motors in the world. Both rows of cylinders, and the upper half of the crank-case integral. Head is detachable, with valves operated by Briscoe-type rocker arms, eliminating noise and wear. Valve-tappets are adjustable from top. A self-contained constant-level splash system, with pump circulation keeps every part thoroughly lubricated.

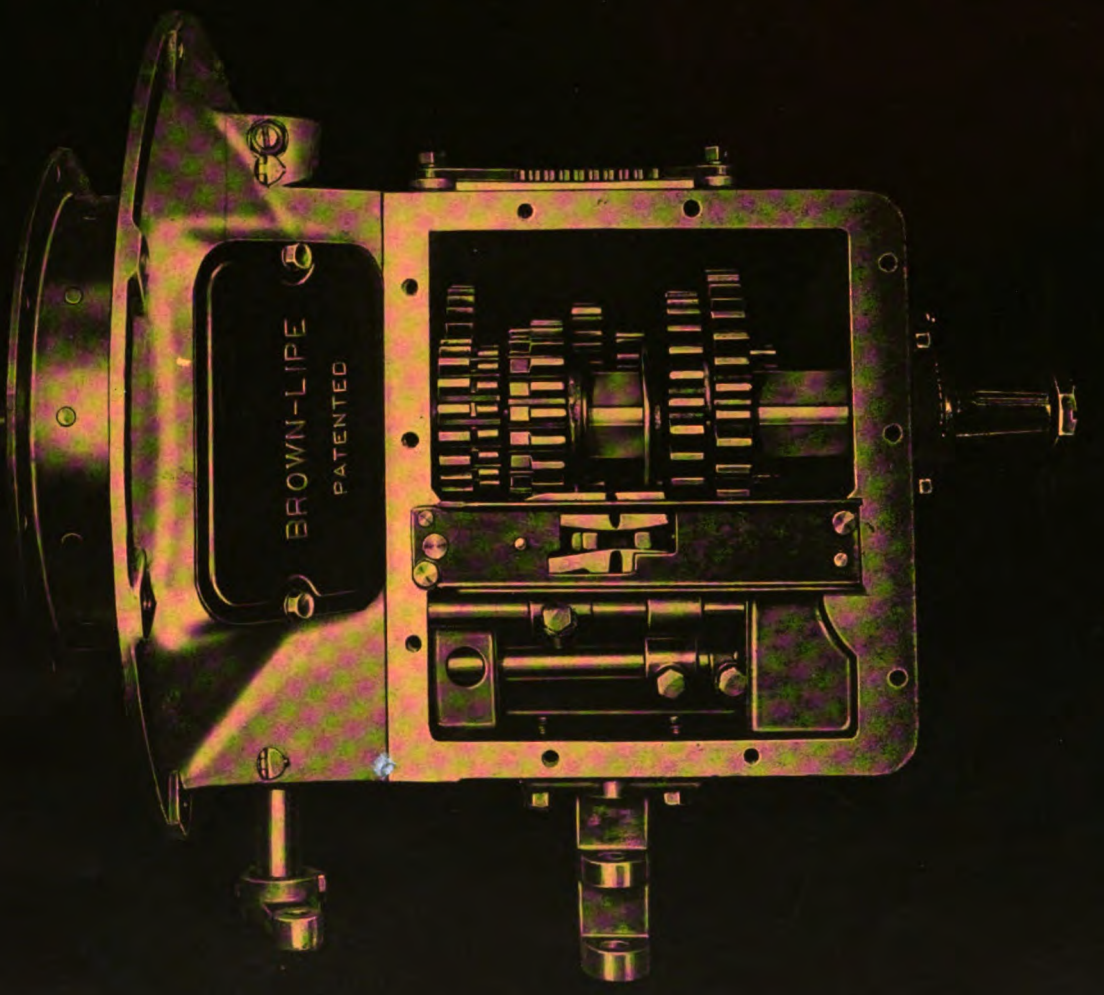


Again we want to urge quick action upon you. The Briscoe "line of three leaders" means the best proposition, present and future, that is offered you today.

Write, wire or call. Don't let some one else get your territory.

BRISCOE MOTOR COMPANY, 105 WILDWOOD AVENUE JACKSON, MICHIGAN

BROWN-



LIPE

Just a reminder of the fact that more than 80% of the cars in use (excluding one low-priced car) carry Brown-Lipe Differentials in their axles.

And a further reminder—that notwithstanding the exceptional demand that has taxed our capacity during the past few months, in no manner have Brown-Lipe products been hurried or slighted in their production.

Considerably more than a hundred manufacturers are now using Brown-Lipe Transmissions—and inability to further increase our production is the only limitation that prevents us from greatly increasing that number of patrons.

Rapid progress, however, is being made on our new factory, with which we hope to be able soon to care for the vastly increased demand for Brown-Lipe quality products.

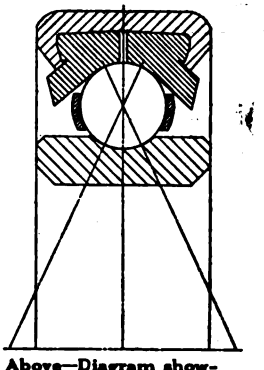
Schatz Quality

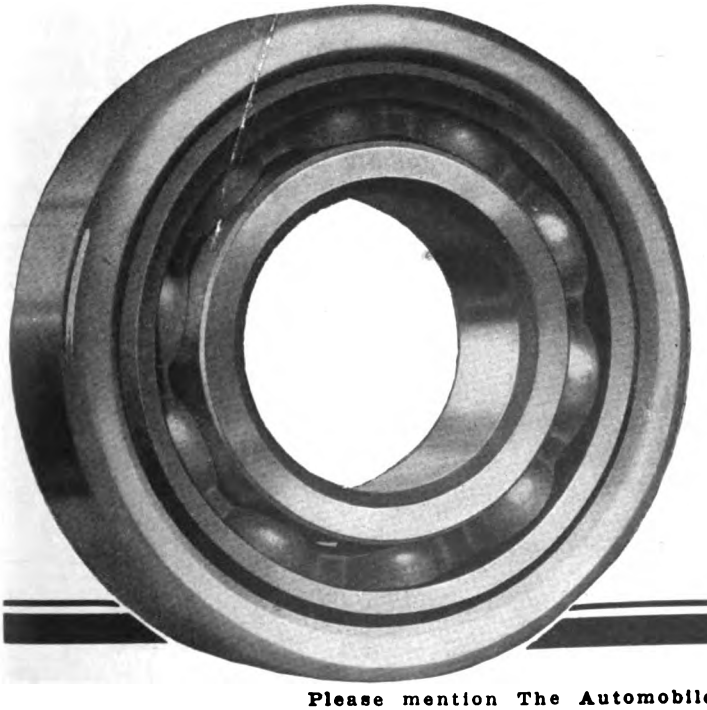
Supplementing the quality of materials and precision with which they are handled throughout every process involved in the manufacture of SCHATZ BEARINGS is a design which not only enables these bearings to take a thrust equal to 50 per cent of their carrying capacity, but also works a marked degree of economy in their application.

This design provides two points of contact on the outer race rings and a third on the inner race ring. Conventional bearing design provides but two. The curvatures of the raceways on the outer race rings as well as in the cone are 4 per cent greater than that of the ball. Theoretically, these contacts are points, although under load the area of contact becomes large enough to support a high thrust load.

Second only to the uniformity and unquestioned quality of SCHATZ BEARINGS is the fact that their three point contact increases insurance against broken balls, for by this arrangement the shock is dissipated and not transmitted through the center line of the ball.



Above—Diagram showing ball support in Schatz annular bearing

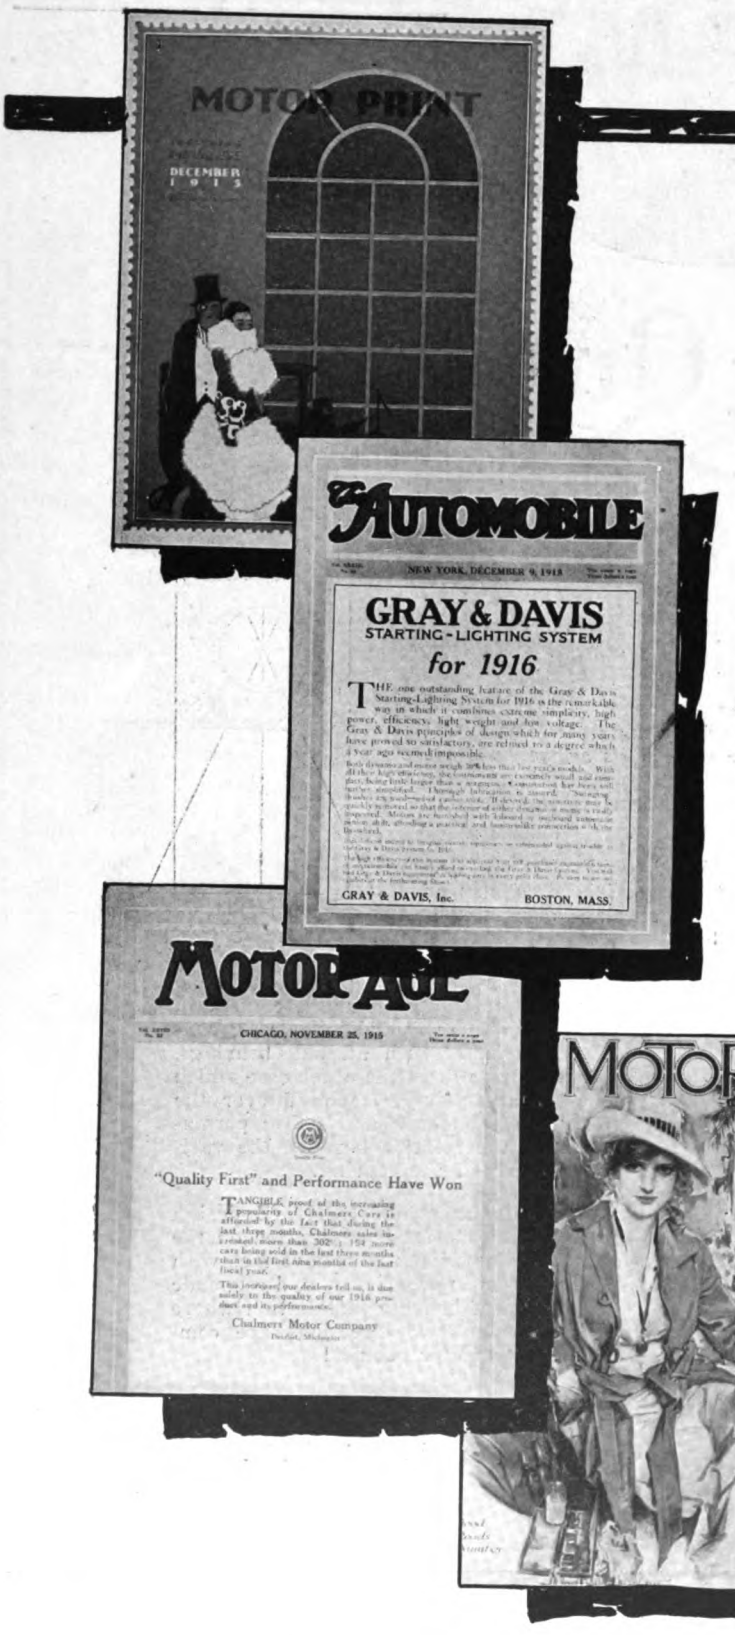


The cup rings which provide a double contact instead of a single contact in addition to the third inner ring contact common with all ball bearings, are a press fit in the outer case which after assembling, is closed over the cups, establishing and fixing permanently the relation between the various parts of the bearing.

The advantages of SCHATZ design merit the closest investigation on the part of engineers who have met with a problem in an efficient and economic solution of bearing installation where loads from two directions are common. Send for booklet!

The Schatz Mfg. Company
Poughkeepsie, N. Y.

125000 MOTORISTS



Here is the push that sets the ball rolling—
An advertising campaign that reaches the families and friends of 125,000 motorists—

An advertising campaign that tells what WONDERMIST is, what it does, its superiority over the best cleaners and body polishes on the market and the conveniences and economy that go with its use—

An advertising campaign that is sufficiently aggressive to increase the existing demand where WONDERMIST is known; to create a demand where it has as yet not been introduced—

An advertising campaign that comes at exactly the right time when it will link up with our dealers' window display proposition to the best advantage.

Are you selling WONDERMIST?

If not, you are overlooking one of the most profitable opportunities the automobile supply business has ever offered—the triple advantage of a live-selling supply with a generous dealer proposition backed by the advertising campaign outlined above.

Ask your jobber.

The Super Carburetor for all types of Modern Motors

EMBODYING the precision principle which is rapidly becoming a standard.

It functions completely through one single moving part—**the Automatic Metering Valve**—which proportions with absolute precision the gasoline and air mixture required by the motor.

The consistent efficiency of the Stewart Carburetor is resultant from this original and highly developed principle.

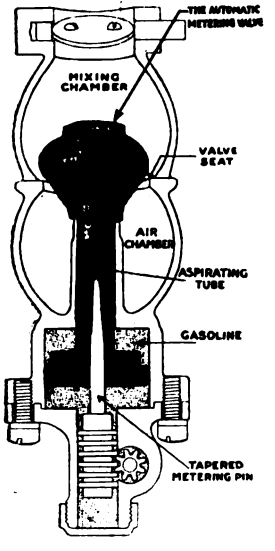
Over 100,000 are now in use in all parts of the world—and under all climatic conditions.

100,000 more will be built in 1916, **alone**—nearly 600 every working day.

Thousands are being and will be supplied direct—to owners who are experiencing inefficient carburetion and poor economy.

For ten years the basic principle of

STEWART PRECISION CARBURETORS



has been consistently adhered to in each successive model. Only improvement of detail has been possible.

A careful inspection of the accompanying sectional view will do much to explain its simplicity, and will illustrate the principle of

THE AUTOMATIC METERING VALVE

The Automatic Metering Valve (shown in the cut at the middle of its stroke) is perfectly free to slide up and down and would normally rest on its seat, entirely closing the air passage thru the carburetor.

Any air passing thru the carburetor *must* raise the valve.

The greater the amount of air the engine draws thru the carburetor the higher the valve must lift.

The valve is lifted against the force of gravity, which, of course, never varies, so that a given amount of air will always lift the valve a corresponding definite height.

This factor of an exact unchanging relation between the position of the Metering Valve and the volume of air passing is utilized to measure exactly and correspondingly the gasoline supply.

It is evident that the suction effected above the valve to lift it will also draw up the gasoline within the valve stem.

It is also evident that the *amount of gasoline* lifted will be measured by the widening of the gasoline passage around the tapered Metering Pin, as the valve is lifted away from it.

Send for the Stewart book A-3. It is the most interesting carburetor book ever issued. Tell us the name, model and year of your car and we will show you how easily the Stewart can be adapted to it.

Jeffery Pleasure Cars

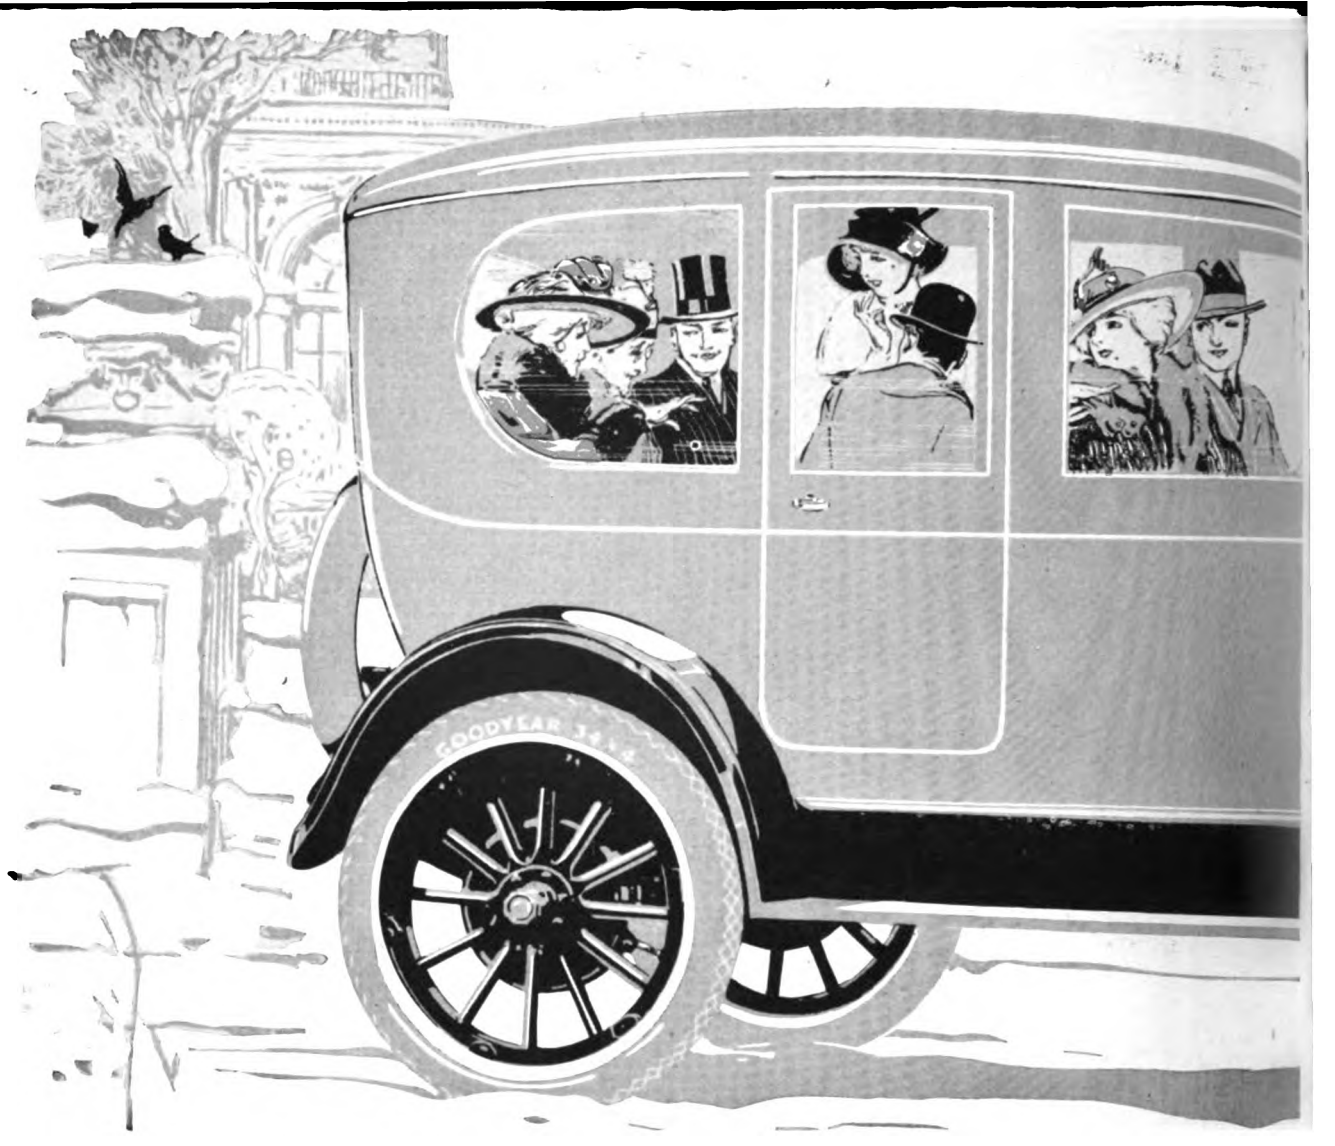
Ushering in a New Motoring Era

For 14 years the THOMAS B. JEFFERY COMPANY has been making motor car history.

It fostered the first American car with the now famous light-weight high-speed motor—built the first automobile of its quality, size and efficiency to sell below $2000, the original Jeffery Four—designed and constructed the amazing JEFFERY "Quad," the truck whose fame has spread 'round the world.

As to more recent achievements, two of the outstanding sensations of 1916 were JEFFERY sensations—the establishment of a new standard of motor car value at a thousand-dollar price and the announcement of the first enclosed coach of real quality to sell at a moderate price—the Jeffery Sedan, complete with both winter and summer tops at $1165.

Jeffery is making motor car history. Post yourself. Read the following three pages.



Don't Envy Closed Car

Heretofore only the wealthy few could afford a closed car.

Now with the coming of the JEFFERY Sedan at $1165 the prohibitive cost associated with closed cars has been forever removed. The JEFFERY Sedan for the first time puts closed car luxury, style and comfort within reach of large numbers of motorists. It is making real the dreams of those who have always envied closed car convenience without feeling entirely able to afford it—until now.

Think of it! At last a custom-built enclosed coach at $1165—only $165 over the price of the JEFFERY Four touring car, yet offering the same features formerly associated only with closed cars costing from $2000 to $5000.

The Jeffery Sedan

$1165

Enclosed Top Removable—Summer Top Included

The roof of the **JEFFERY Sedan is** of laminated **wood construction** covered with a **very fine quality of** top material. The **rear section of the** body of the top **is of metal. The sup**ports and sills **are built substantially,** giving a rigidity **of construction** which meets **every test.**

The windows **are of** ¼**-inch crystal** plate, ground **and polished. In the** two broad forward **windows and in** the doors the **glass is arranged to** drop half way, **affording ample ventil**ation.

The illumination **of the interior is** provided by an **electric dome placed** in accordance **with the latest enclosed** car practice.

Divided front **seats afford easy access** from the rear **to the front compart**ment, doing **away with fore doors,** thereby providing **wider windows, a** broader vision **and longer unbroken** body lines.

The upholstery **is grey whipcord—** leather seats **optional. The window** curtains—portiere **type.**

Comforts-Enjoy Them!

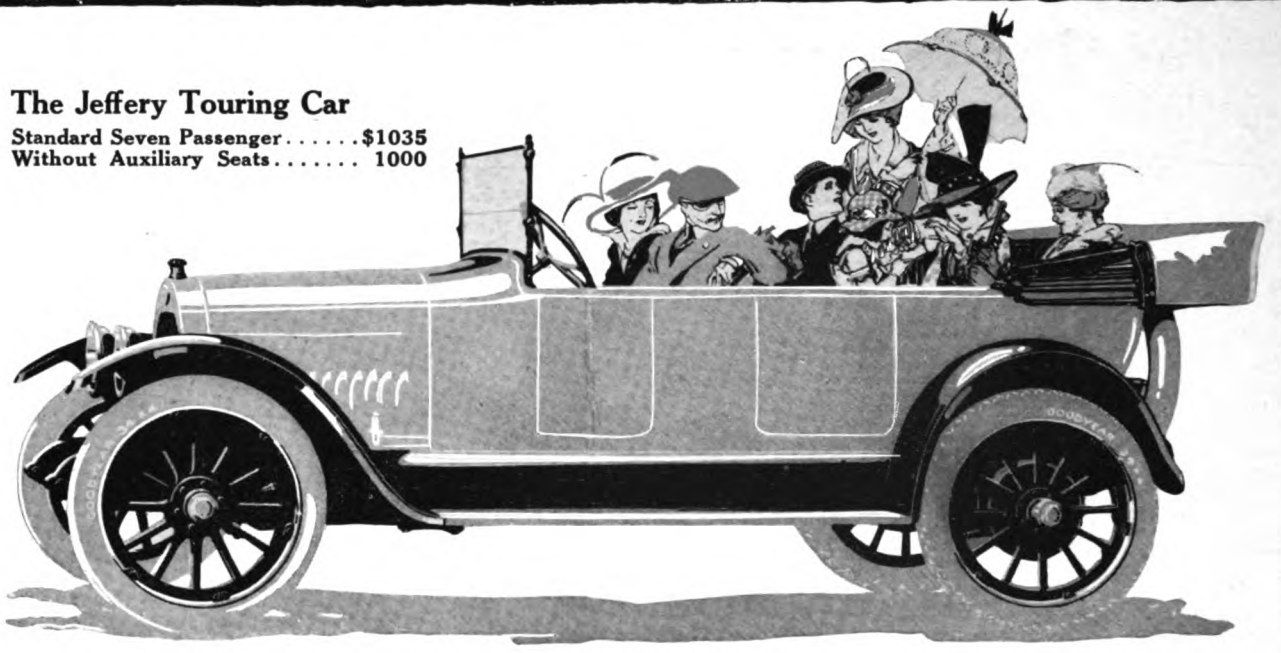
And when summer comes it is a simple matter to remove the Sedan top—giving you a touring car with summer top—at NO EXTRA COST. Here you have virtually two cars in one at the price of one car alone!

Judge the Jeffery Sedan first by appearance. You will find **no flaps, exterior curtains, buttons or unsightly bolts.** Body and top blend perfectly. Body and top are flush with each other. Each top is tailored especially to the particular body which carries it—thereby eliminating every possibility of looseness, rattling, squeaking or rumbling.

And the upkeep of the JEFFERY Sedan is in the touring car class. For with all its strength and firmness the weight of the Sedan top is but approximately 200 pounds, only a trifle over 100 pounds additional to the weight of the JEFFERY summer top—ample insurance of economical operation.

The Jeffery Touring Car

Standard Seven Passenger.....$1035
Without Auxiliary Seats..... 1000



Jeffery Cars 93% Jeffery Built

JEFFERY cars are built almost entirely beneath the JEFFERY roof—including even bodies, tops, axles and other parts usually purchased from special makers. We are dependent neither upon the deliveries nor quality standards of parts manufacturers. The JEFFERY plant is one of the largest and most scientifically equipped of its kind in the world. JEFFERY workmen are highly paid. The result—JEFFERY Quality has become a proverb among JEFFERY owners.

This winter, during what is generally known as the dull season, 3,000 men have been steadily employed in the JEFFERY factory as against 1,300 last year. Shipments during the first six days of this month exceeded those of the entire month of December last year.

JEFFERY dealers everywhere are doing a record-smashing business—winter as well as summer. An opportunity for a limited number of new dealers will be open the first of the year. Investigate.

Orders must be placed immediately to insure early deliveries. Write or wire us.

A luxurious "electric" is a sort of drawing room on wheels and the appointments ought to harmonize in quality. The Waltham automobile clock does not suffer by comparison with any environment.

The Waltham Automobile Clock

is cased in various forms and with different dials. There is a model suited to every purpose and taste.

In every case, the instrument itself is of true Waltham quality.

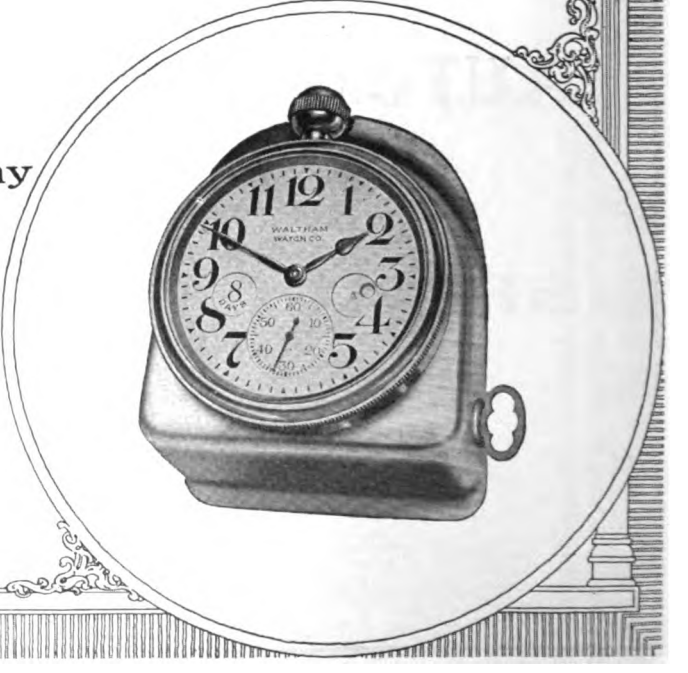
The following cars use our clocks as regular equipment:

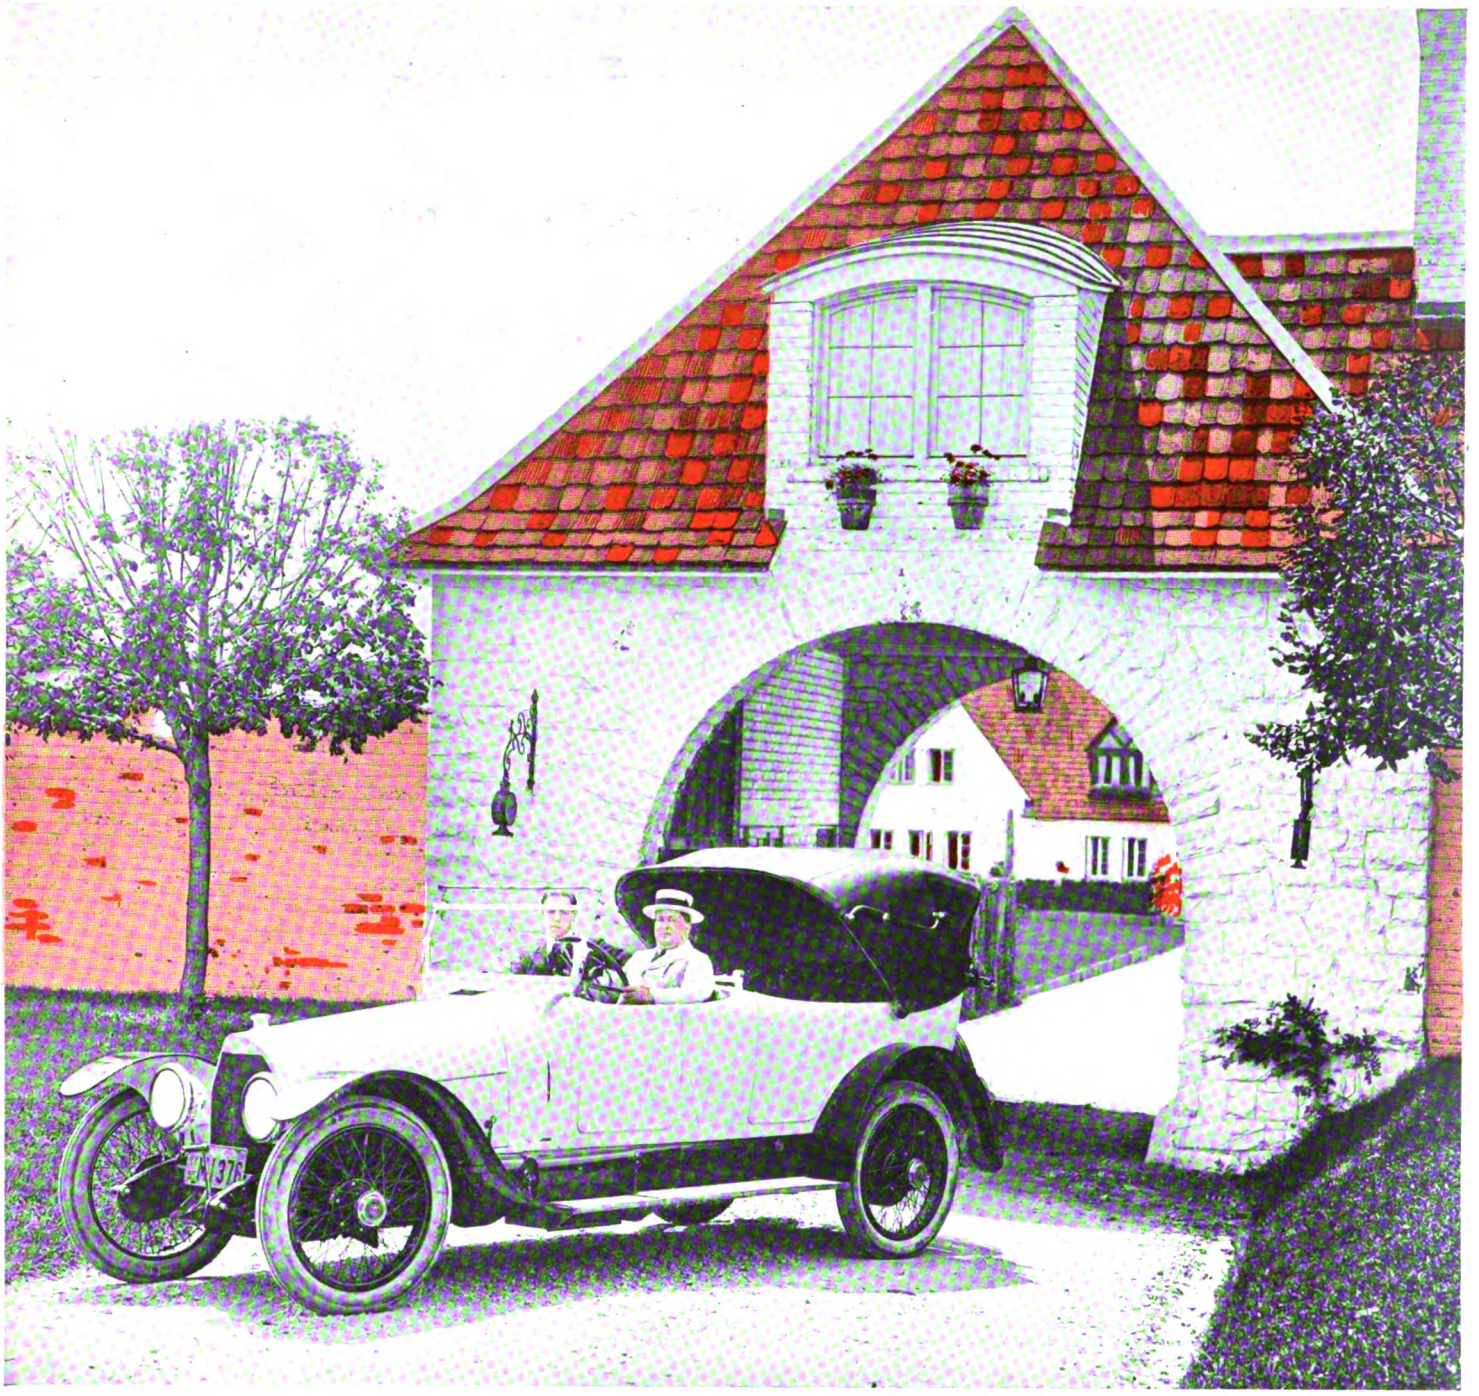
Brewster	Marmon
Cadillac	Owen Magnetic
Cole	Packard
Crane	Pierce-Arrow
Detroit	Rauch & Lang
Franklin	Rolls-Royce
Haynes	Russell-Knight
Jeffery	Simplex
Locomobile	Stearns
Lozier	Winton

The following companies equip *all* their enclosed bodies with our timepieces:

Brewster	Locomobile
Cadillac	Packard
Franklin	Pierce-Arrow
Stearns	

Waltham
Watch Company
Waltham
Mass.





The Story of a Marvelous Car

TWELVE months ago the first announcement of the Owen Magnetic car was published.

Since that time giant strides have been made, both in the development of the car and in the organization of facilities for its production on a scale large enough to more nearly meet the demand.

During the past year Owen Magnetic cars have been placed—not merely sold—in the service of some of the most critical motorists in the country—men whose demands put the extreme burden of proof upon a car's stamina—as well as upon its ability and ease of handling, and every car, without exception, has won not only the unqualified but enthusiastic approval of its owner.

The Development of Our Organization Has Paralleled the Success of the Car

First—The co-operation and interest of the General Electric Company, under whose direction and guarantee the electric transmissions will be built, not only insures our supply of these important units but places the unqualified stamp of approval of the world's foremost electric manufacturers upon it.

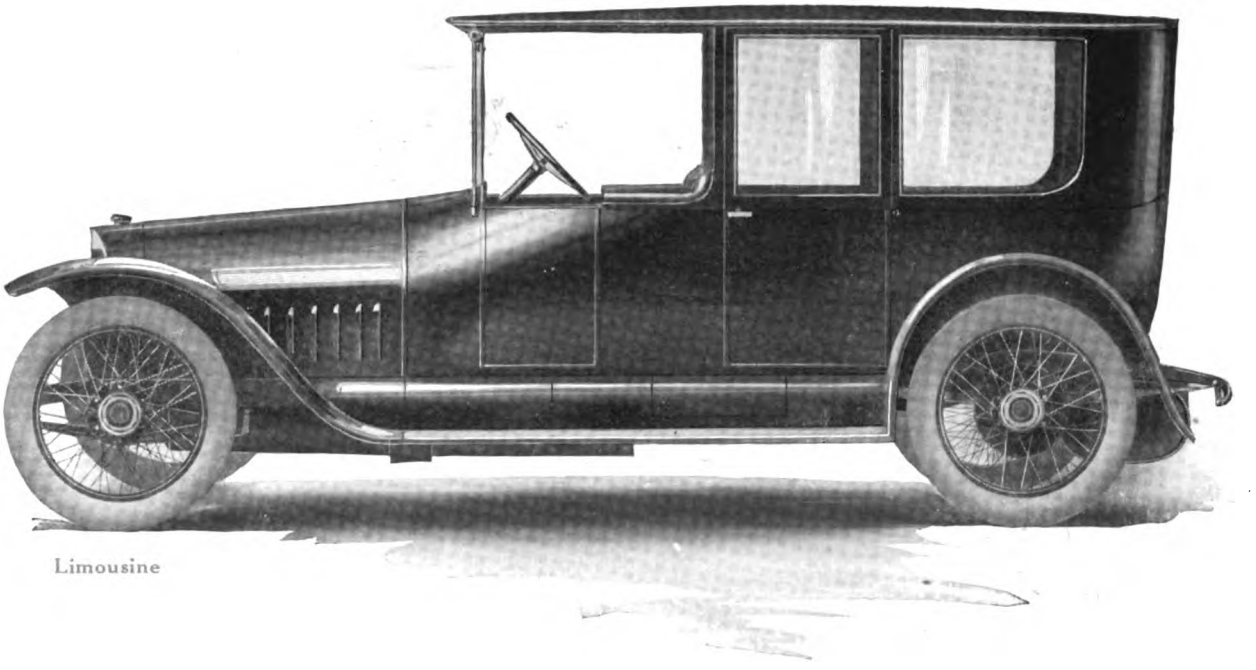
Then, the acquisition and consolidation of the manufacturing and coach building facilities of the Baker R & L Company of Cleveland assures us of unsurpassed manufacturing conditions and quality of workmanship in both chassis and body building that is world famous.

Last year the exhibit of Owen Magnetic cars at the Automobile Shows focused the attention of thousands.

Many came with a more or less accurate understanding of the principle of magnetic transmissions—others to see it and learn about it for the first time—what it was, how it differed from the conventional, and what advantages accrued from it.

They found a car with a six-cylinder engine and a chassis, with but one exception, the same general design as other high-grade cars.

They found that the engine—the opera-



Limousine

tion of which is identical with any other—created the power, but instead of fly-wheel, clutch, transmission gears, and individual units for starting and lighting, they saw the Entz system of transmission, a complete electric plant, yet far less complicated than the conventional units it displaces—a simple and effective means of transforming the inelastic power of the gasoline engine into flexible energy for driving the car—and used also for starting and lighting it.

Thus it is that practically every function required in the operation of the car—except the production of power—is centered in a simple electrical machine which makes possible a multiplicity of speeds where heretofore but three or four have been practicable.

Every operation from starting the car on up to a speed of sixty miles an hour is regulated by a simple lever attached to the steering wheel. When the power is applied, the car moves away as if impelled by unseen force—with absolute silence—with an acceleration a thousand times more flexible than can result from any gasoline engine, regardless of the number of its cylinders, working with the conventional gear transmission.

The consensus of opinion of all who have seen and had the operation of the Owen Magnetic car explained to them is that it is the fulfillment of the ultimate in motor car construction reduced to the greatest degree of simplicity.

The impression of those who have gone farther and taken a demonstration of the Owen Magnetic is that we have harnessed under easy control the power and efficiency of the gasoline motor, giving it the flexibility of the steam engine and the simplicity of control of the electric.

This year you can allow your interest in the Owen Magnetic car to take definite shape.

The car itself in the hands of its owners has proven a huge success.

We ask that you honor us with a visit at the shows, or let us send you the Owen Magnetic literature.

FACTORY CORRESPONDENCE

San Francisco, Feb 2, 1912.

Messrs. R. H. Owen & Co.,
5th Ave., 142nd St.,
New York City.

Dear Mr. Owen:-

Your car is running excellently. I
five others - foreign and domestic, but have
ed any of them since receiving yours. In
whatever and there does not seem any

Yours,

Geo Whittell

Oakdale, July 29, 1912.

R.H. Partridge, Sales Manager.
R.H. Owen & Co.,
57th Street & B'way,
New York City.

Dear Sir:-

The Owen Magnetic for you sold me
far surpasses my expectations. You undoubtedly
have many enthusiastic owners, but none can be more
so than I am. The wonderful flexibility, ease of
control, quietness at all speeds, easy riding and
general performance of the car leaves little to be
desired.

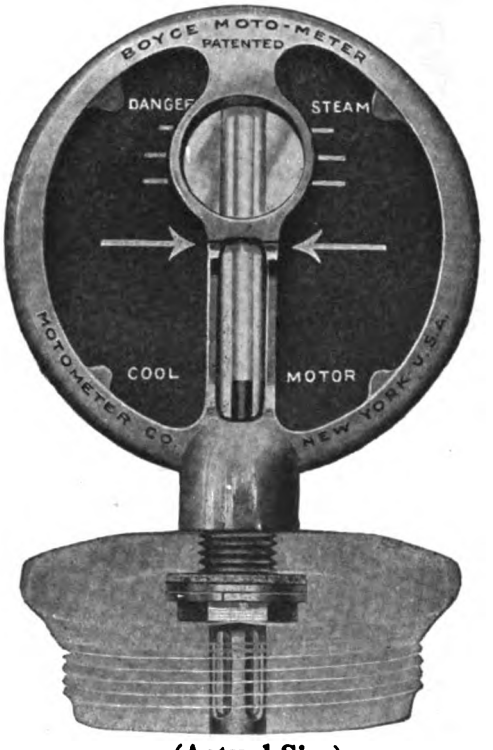
My car is greatly admired wherever it is
seen; the carriage work is very good. I predict a
great success for this form of transmission.

Yours very truly,

A. L. Bowers, Jr.

New Boyce MOTO-METER

Midget Model



(Actual Size)

A motor heat indicator for small cars combining perfect accuracy with sturdiness of construction.

It can be attached to any radiator cap in 10 minutes.

$2.50

Motorists now agree that the Boyce Motometer is a NECESSITY

Primarily a gasoline engine is a heat engine and is only efficient when operated at proper temperature—the BOYCE Motometer tells the driver this temperature at all times and warns him of possible motor trouble before damage can take place.

The leading engineers anticipating the requirements of the car owner for motor protection and efficiency — have adopted the BOYCE Motometer as standard equipment on more than 50,000 cars for 1916.

In addition to our larger models we have designed and are now placing on the market the Midget Model BOYCE Motometer to meet the great demand of the light or *small car owner*.

On sale by leading supply stores. Get one from your dealer or order direct

Reserve Artillery!

How we help the dealer "cash in" on The Big Push

Last month we announced our big campaign in the Saturday Evening Post and seventeen other national mediums.

It is The Big Push!—the strongest support ever given the automobile dealer in the sale of an article like Campbell Detachable Upholstery.

Now we announce the Reserve Artillery—the selling force we furnish our dealers so that they may convert the magazine-created demand for Campbell Detachable Upholstery into dollars in the cash drawer.

The beautiful display stand illustrated above is but one of the Big Guns. We give you in addition handsome posters in seven colors, booklets, etc., to follow up your trade and make sales.

Without any concentrated selling effort Campbell Detachable Upholstery outsells all other articles of interior trim for motor cars. But backed by the tremendous advertising campaign we are putting behind it, Campbell Detachable Upholstery is the livest accessory you can stock.

If you want to sell prestige, luxury that has no competition, and an article that is in a class by itself, that insures you against mail-order competition, write or wire for samples, prices and trade discounts on Campbell Detachable Upholstery and details of our co-operative selling plan. The Perkins-Campbell Co., 633 Broadway, Cincinnati, Ohio; New York Office, 89 Chambers Street.

MARMON 34

A Scientifically Constructed Light Weight Car

MARMON

Announcing a New Automobile

LET us say in the beginning that only the *facts* about this new car will be published for it is against our policy to allow any announcement to smack of sensationalism.

We have stated, and so have the publishers of this paper, after careful investigation

— *that this new car fully equipped will ride with comfort and safety and handle with extraordinary ease over ordinary highways at from fifty to fifty-five miles an hour.*

— *that it will easily do sixty-five miles an hour.*

— *that it will accelerate from ten to fifty miles an hour in less than eighteen seconds on any hard, level road.*

— *that it weighs only three thousand five hundred and forty pounds although of seven-passenger capacity, and one hundred and thirty-six inch wheel base, completely equipped with spare wheel and tire, with gasoline, oil, and water compartments filled, and full complement of tools.*

These are *demonstrable* facts. Unprejudiced men have seen them demonstrated.

Then is the Marmon the *new motor car* that will sooner or later take the better-class motor car buyers by storm?

We firmly believe the answer is in the affirmative, and that you will be willing to so answer that question just as soon as you have tried this unusual car. For here is a motor car that is as *beautiful* as it is efficient.

We will state without hesitancy, and we are conservative, that no car in the world is built better.

This model has been two years in development with fourteen years of successful motor car building experience back of it, plus a manufacturing experience that dates from 1851.

We know materials thoroughly, we use only the best, and we build every important part of this car ourselves.

The Marmon 34 is a car of remarkable power, perfect balance, light weight, extremely easy to handle, refined in every detail, of beautiful design and striking individuality—in short, the *finished car*.

We invite the motor-car industry to keep our every statement in mind and examine the Marmon car.

MARMON 34

A Scientifically Constructed Light Weight Car

SPECIFICATIONS OF THE MARMON 34

Body Types — THE *Marmon 34* is furnished with the following body types: Seven-passenger touring, five-passenger touring, four-passenger "Club" roadster, three-passenger "Club" roadster.

Wheelbase — The *wheelbase* is 136 inches. Short turning radius.

Weight — The *weight* of the seven-passenger touring car, ready for shipment, is 3295 pounds. The actual weight of this car, in full touring trim — extra wheel and tire and all gasoline, oil, and water compartments filled — is 3450 pounds for five-passenger car, 3540 pounds for seven-passenger car.

Aluminum — *Aluminum* is used more extensively than in any other car. The main structural member of the motor, the body, fenders, hood, radiator shell, and many small castings — usually of iron or bronze — are of aluminum.

Motor — The *motor* is six-cylinders, bore 3¾ inches, stroke 5⅛ inches, with quiet, efficient overhead valve construction. The en-bloc cylinder casting, water jackets, bearing supports, and crank case are combined in a single aluminum casting. Hard-iron cylinder barrels fit in the aluminum casting with a cast-iron firing head.

Lubrication — Motor lubrication is by the famous Marmon hollow crank shaft force-feed system, supplemented by a hollow rocker arm pivot so that all valve parts are lubricated by pressure feed. Cams are integral with cam shaft, cut from a single steel forging.

Frame — The *frame* is of extraordinary depth — ten inches. The steel running boards, hot riveted to the side members, form a part of the frame.

Body — The *body* bolts direct to the frame without sills or subframe. It is made in three sections: First — cowl, containing gasoline tank, wind shield supports, and instrument board; second — front seats with compartment for folding chairs; third — tonneau seats. The floor boards are 24½ inches from the ground.

Upholstery — The *upholstery* is removable, the extra seats fold into a compartment when not in use, and passengers sit deep in the car at comfortable height, with plenty of leg room.

Springs — The *rear springs* are of the compound cantilever type, mounted across to the rear of the frame and axle, eliminating side sway and giving perfect spring action and balance. All springs are self-lubricating.

Front Axle — The *front axle* is an I-section drop forging with marine-type thrust-bearing steering spindle, operating in self-contained oil bath.

The *famous Marmon cone clutch*, transmission suspended on front end of torque tube, tubular propeller shaft, and perfectly aligned helical gear — give a silent drive and a saving of power.

Oiling — *Only four grease cups are used*, and these are on the steering connections. The front axle spindles, clutch release collar, transmission and rear axle run in medium weight oil sufficient for 15,000 miles.

Wheels — Five *wire wheels* are standard equipment. Tires, Silvertown cord 34 x 4½ inches, front and rear.

Equipment — Bosch magneto, generator, and starting motor. Every *convenience* that may be desired for general use is furnished.

Prices — $2700 for three, four, and five-passenger models; $2750 for seven-passenger model. All prices f. o. b. Indianapolis.

Deliveries — *Deliveries* are now being made.

MARMON 34

A Scientifically Constructed Light Weight Car

MARMON

THE Marmon method of building motor cars has been developed through fourteen years of continuous success.

And the Nordyke & Marmon Company had been successful manufacturers of machinery for fifty-one years before the first Marmon motor car was produced. We have never experimented at the expense of Marmon dealers or owners.

We have never introduced a *novelty* in any Marmon car though we *have pioneered* in placing new *features* on the motor car market through the medium of our cars. We have *developed* novelties, and used the resulting practical features, but we have done the experimenting and developing in the Marmon *factory* at Marmon *expense*.

Our first car built in 1902 marked the beginning of the general use of side-entrance tonneau. It had straight-line drive, selective-type sliding gear transmission, double brakes on rear wheels, controls on the steering column, and the famous hollow crank shaft and force-feed oiling system — features now universally used.

We have never jumped forward just "to be first." So we are usually first when it comes to *practical* advance.

We emphasize this point because in our new 34 there are features that may seem novel.

For instance — the Marmon 10-inch frame, of which the running boards form a part, the compound cantilever cross-suspension rear spring, the fact that there are only four grease cups on this car, and the extensive use of aluminum.

But these features and others have a definite place in Marmon *performance*. They are not included either to *meet competition* or to "take it unawares." We never have introduced a feature merely for its value as a "talking point."

The Marmon's greatest feature is that intangible, undescribable thing called performance, for educated buyers finally *purchase* on the strength of a car's performance and Marmon performance is so *unusual* that every Marmon car not only *stays* sold but its owner unconsciously becomes a Marmon salesman working for you who sell these cars.

Single features, no matter how good, in any automobile are forgotten in the general results shown by the car on the road.

The Marmon has the features to impress those who place importance on single features, but its great *permanent* selling power is in *Marmon performance* and it is the conviction of the officials of this company that in this the Marmon leads all cars.

AN OPPORTUNITY FOR THE DEALER

We are increasing our output this year. There are sections where the Marmon is not represented — communities where there are real opportunities to market this type of car. Experienced dealers who are interested in real worth-while advancement are invited to communicate with

Announcing the Highest Quality Tire Possible of Manufacture

HARDMAN "SURE-GRIP" —TIRES—

¶ During years of practically localized activity our facilities have grown to such an extent that we are ready for national distribution.

¶ The opportunity therefore, is presented to high grade dealers, to acquire the exclusive Agency for Hardman Sure Grip Tires in their particular territories.

¶ HARDMAN SURE GRIP TIRES are high quality; high priced tires. They are the best tires that can be produced insofar as general manufacturing principles are concerned, and from a standpoint of wear and all around efficiency, in addition they possess several features of design that make them stand head and shoulders above the crowd.

¶ The HARDMAN Agency offers a splendid opportunity for a substantial money-making business with an assured future.

Are you located in the territory we want to open up?

Better write and see—Or wire collect.

HARDMAN TIRE & RUBBER COMPANY
BELLEVILLE, N. J.

LOZIER

THE connoisseur of art readily sees the beauty of the original, though there are prints which seemingly are alike. The work of a Rubens or an Angelo cannot be mechanically duplicated. Antakolski may be copied, but the copy will not be an Antakolski. Ellman alone can elicit from the violin the sweetness of an Ellman. There is only one Paderewski.

Men who know separate the copy from the original.

The gracefulness, the elegance, the tasteful and pleasing lines, the exclusiveness, the richness and the mechanical perfection of the Lozier, though imitated, have never been equalled.

Men who know have chosen the Lozier. They have chosen the Lozier because they know.

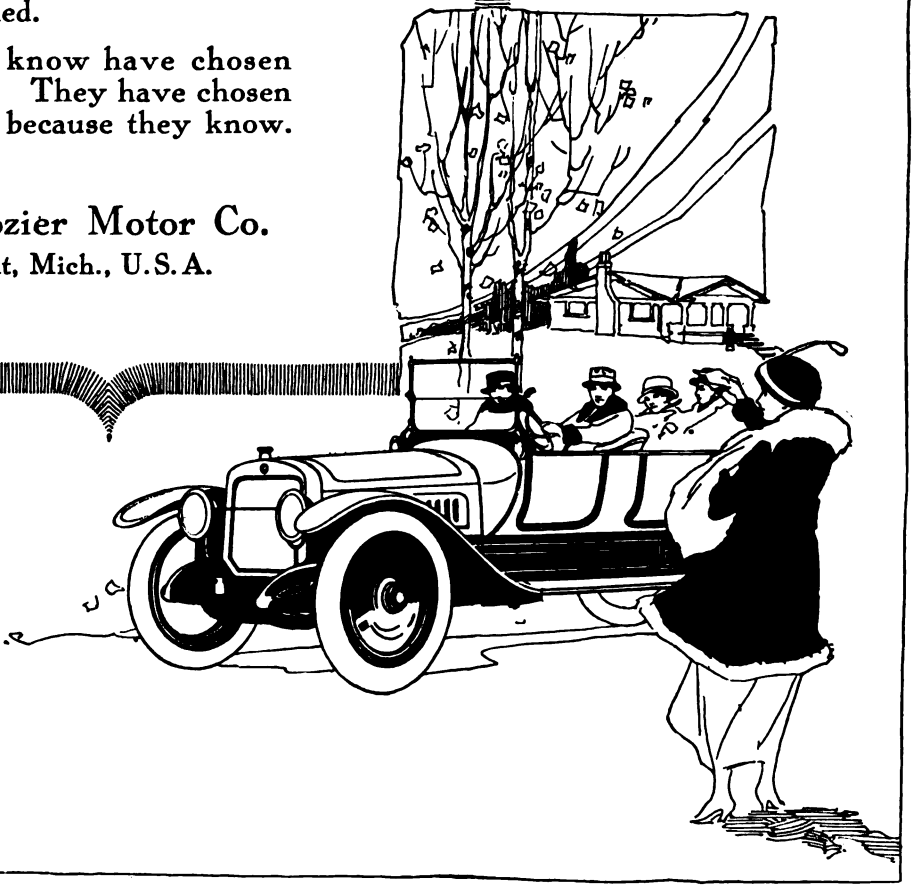
A Word With Dealers

Though you may or may not know it, it is true, nevertheless. Dealers who are now connected with the new Lozier proposition are doing well.

A number of our representatives are devoting their entire attention to the Lozier and cashing in.

We have some good territory open. If you can qualify, we'll take the matter up further with you.

Write or wire.



We shall exhibit at all the shows. There you can compare the Lozier with other cars at or about its price. That you'll admit the Lozier still retains its supremacy, we feel confident—for the Lozier is a better car to-day than it has ever been.

INCREASED
EXAMPLE OF

SHOWN herewith is the new home of Fedders radiators. This plant which has just been occupied provides for a little more than double the capacity of the old plant. The new portion is the four story structure shown in the illustration above.

¶ Notwithstanding the fact that even with this vastly increased manufacturing facility we are unable to accept all of the orders offered us at this time, we feel that with this new factory we have the finest equipment for the production of quality radiators in existence. At least under normal conditions it should enable us to maintain our reputation for both quality and service—a reputation attested to by scores of America's leading manufacturers, many of whom have used Fedders radiators since first they were produced.

closed coach built in

Here is a Sedan—or Coupe if you prefer—that matches in beauty, comfort and refinement the creations of a master coach-maker.

It is absolutely free from rattles—not a chatter in it. It is weather proof—there isn't a chance for water to seep through even in a driving downpour. It has inverted top irons—leaving the surface free and smooth.

KISSELKAR
Every Inch a Car

The ALL-YEAR Car is mounted on both the 32-Four and 42-Six chasses—*challenge values in mechanical worth.* The 32-Four is the sturdiest small car in America. The 42-Six is as good as a Six can be.

The five passenger ALL-YEAR Sedan on the 32-Four is $1450, on the 42-Six $2000. The ALL-YEAR Coupe on the 32-Four is $1450, on the 42-Six $1950.

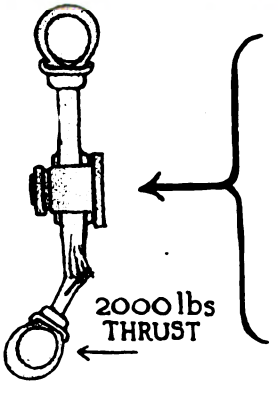
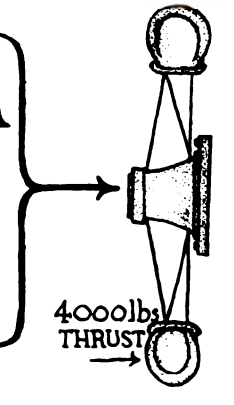
Try to pull the pencil in two, lengthwise, and note its great tensile strength. The strain on Houk spokes is always an ***end pull.***

Break the pencil sidewise with ease and you illustrate for yourself the application of lateral strain to the wooden spoke.



COMPARE THEM YOURSELF —



Tensile Strength *versus* Fracture Strength

You have traveled along a country road where rut after rut would strike your wooden wheels a dangerous lateral strain. Curves, rocks, and bumps are encountered now and then by every country-used car. Wooden wheel drivers, through instinct, have learned to drive these places with great caution.

Add joy to motoring by the absolute assurance that the strongest part of the car is the wheels and the easiest, quickest tire change in the world may be made with your own Houk Quick-Change Wire Wheels.

HOUK MANUFACTURING COMPANY, Buffalo, N. Y.

New York, 1792 Broadway **Chicago, 2337 Michigan Ave.** **San Francisco, Hews Bldg.**

Your Money Buys More

More power and greater smoothness—improved 45 horsepower motor which is the last word in six-cylinder smoothness and flexibility.

More room—125-inch wheelbase which means—

More comfort—for a full quota of seven adult passengers.

More convenient electrical control—all switches located on the steering column.

More certain starting—a two-unit starting and lighting system.

More tire mileage—4½ x 35 tires.

More stable organization—to give you service—there are more Overlands in use and going into use every day than any other car of more than 100-inch wheelbase.

Because we are the world's largest producers of sixes and fours, we can and do give in this improved six a car which is *dominant value* among sixes.
